Acknowledgments

This document contains newsletters written by Philip Pizzo, MD, during his tenure as the Dean of the Stanford University School of Medicine, 2001-2012. The newsletters were originally sent by Dean Pizzo in email format to Stanford administration, faculty, and staff. In November 2017, the content of these newsletters was provided by Michael Halaas, Chief Information Officer of Stanford University School of Medicine Information Resources and Technology (IRT), and by Mark Trenchard, Director of Academic and Interactive Technology for IRT, to the Stanford Medical History Center in Lane Medical Library. Drew Bourn, PhD, the Historical Curator of the Medical History Center, oversaw the compilation of the newsletters into the present document, with assistance from Stanford undergraduate student Karly N. Chin.

Dean's Newsletter

April 2, 2001

Beginning

Today marks my first “official” day as a member of the Stanford University community. I am enormously pleased to be here and will do my best to help serve the Medical School, Medical Center and University. In order to keep you informed of the many issues and challenges that are going on, I will use this email Newsletter to communicate with you about important issues – at least as I am seeing them. In turn, I will welcome any comments or suggestions that members of the faculty, student body or staff wish to offer.

During the past months I have spent considerable time meeting with faculty, department chairs and students at Stanford as well as medical school, hospital, and university administrators and trustees. I have tried to listen carefully to the issues felt to be most important to the Stanford community and I have begun to offer some of my views and vision for the future. As part of this information exchange, I developed and then circulated a list of strategic initiatives to department chairs and faculty leaders some weeks ago as a vehicle to shaping our collective vision for the future.

There is no doubt that the last several years have been enormously challenging as well as exciting for Stanford University Medical School. In many ways, the events that have transpired during the past several years depict the current polarity of academic medicine. On the negative side, the events and consequences emanating from the Stanford-UCSF merger and de-merger delineate the enormous financial external and internal forces that have been impacting academic medical centers during the last decade. At the positive pole, the incredible contributions to new knowledge by faculty, along with the exceptional clinical care delivered to children and adults and the quality and contributions of remarkable students provides a promissory note of the incredible opportunities that lie ahead.

Without doubt, the financial challenges impacting academic medical centers today are significant and unrelenting. The impact of some of these pressures was underscored by an article in the San Francisco Chronicle and the San Jose Mercury News on Friday, March 30th. It is imperative that the appropriate efforts are made to stabilize and optimize every facet of the medical center that is within our control and which improves our financial position without impacting the quality of clinical care and missions in education and research. I know that Dr. Gene Bauer is committed to achieve these objectives. It is equally imperative that we work to change the external forces impacting our school and medical center, through advocacy and public education efforts with the patients and families, employers, insurers and state and federal government. Such efforts are essential and will help assure that the exceptional contributions of our research and education programs can be fulfilled. I pledge to work on your behalf to help facilitate some of these changes. However, they can only be achieved if we work together for the mission of our school, medical center and university.

In order to assure that we can work closely together I believe it is important that we define our mission clearly in conjunction with the overarching goals we seek to achieve. Accordingly, I am going to take the liberty of offering my views as shared recently with department chairs and senior faculty:

Mission:

To be a leading research-intensive School of Medicine that improves the health of adults and children through education and biomedical research.

Overarching Goals:

1. To make Stanford the national leader in the reformation and rejuvenation of research intensive Medical Schools in the education and career development of thought leaders.
2. To transform the future of biomedical research by novel and innovative alignments and collaborations between basic and clinical scientists and through interdisciplinary partnerships and collaborations with investigators and scholars throughout the University as well as with public and private partners worldwide.
3. To re-engage the public trust in respecting the value and importance of Medical Schools and academic medicine because of their contributions to outstanding patient care through education and research.

In order to achieve these goals, I have outlined ten strategic initiatives in my communication with Department Chairs in February. These focused on (1) Education and Training; (2) Research; (3) Clinical Care; (4) Advocacy, Community Service and Public Policy; (5) Academic and Career Development; (6) Governance, Administration and Finance; (7) Facilities, Infrastructure and Support Systems; (8) Communication; (9) Development/Fundraising; (10) Stanford as a Global Model. I am taking the liberty of highlighting the first five of these in order to share some of my directional signals with you. I will welcome your input and during the next weeks work I will review these with various members of our community to further prioritize them and develop the timelines for achieving them. However, in order to engage faculty and students in this process, I want to outline them with you at this very early juncture.

Education and Training

1. Carry out a comprehensive review and renewal of the medical education curriculum with the overriding goal of educating future thought leaders by focusing on the development of physician-scientists and leaders in academic medicine and biomedical research, as well as related leadership opportunities in the public and private sectors. To achieve this it is necessary to define the core competencies of requisite knowledge that serve as the essential underpinnings for all MD students. This platform should then permit creative pathways for interdisciplinary education and individualized career development, including, for example, opportunities in: Basic and clinical sciences (broadly defined) including also bioengineering, computer sciences, biocomputation, informatics; Public Health/International Affairs;

Advocacy/Public Policy/Government; Education; Law; Arts and Social Sciences; Religion and Ethics; Business/Health Care Financing

2. Value the importance of outstanding clinical training at Stanford Medical Center and its valued affiliates at the VA Hospital and Santa Clara Medical Center in order to foster excellent clinical skills and knowledge in students and faculty.
3. Sustain and enhance the most outstanding Medical School-based Graduate Education Program which attracts the best students and that prepares them for success as leaders in academia or the public and/or private sector.
4. Create opportunities for graduate students to be acquainted with the principles and practice of clinical medicine in order to foster an understanding and interest in translational clinical research.
5. Develop a continuum for training physician-scientists that extends throughout medical school, graduate medical education and fellowship training. Such a program might be anchored in the M.D./Ph.D. curriculum. Further, efforts to expand the M.D./Ph.D. training program should be sought.
6. Review, expand, and seek to endow the Medical Scholars Program.
7. Seek new funding source to support educators as well as Medical and Graduate School education programs.
8. Address faculty education opportunities that foster knowledge exchange, communication and research opportunities among basic and clinical investigators and clinicians, including, for example: Faculty retreats can help promote dialogue, collegiality and collaboration. In addition, a robust role for the “teaching attending” which includes members of both the basic and clinical science communities can help forge new alignments.
9. Review and expand efforts in Continuing Medical Education to optimally engage and align community physicians with Stanford Medical School and Medical Center.

Research

1. Continue to develop and enhance excellence in basic and clinical investigation in conjunction with seeking ways to foster interdisciplinary research efforts that are either programmatic or represent areas of opportunity
 - a. Several programmatic areas have already been defined including: biocomputation, bioengineering, genetics/genomics, cancer biology, microbiology and host defense, neuroscience, and cardiovascular science. Wherever possible, there should be an alignment of basic and clinical research opportunities with the "centers of excellence" areas being developed through the Child Health Initiative and Stanford Hospital strategic initiatives.
 - b. Stimulate areas of special opportunities – especially those which pair MD’s with PhD’s, to stimulate translational research.
2. Develop an Office of Clinical Research to support academic alignment and an infrastructure that facilitates clinical investigation ranging from translational research to clinical trials, health outcomes, epidemiology and behavioral research.

3. Assess and overcome impediments to recruiting the best graduate students, postdoctoral fellows and junior faculty. Examples might include salary equity and housing.
4. Initiate a regular seminar for senior fellows/junior faculty to present research work to Dean, Senior Associate Deans and responsible Department/Division Chairs in order to provide interaction and exposure to Stanford's "rising stars".
5. Critically review space, facilities and utilization to develop a 5-10 year space plan.

Clinical Care

1. Value the important role that clinicians contribute to the community of excellence within a research-intensive academic medical center, including the VA Medical Center, Santa Clara Medical Center and other affiliated institutions.
2. With VP, CEO's and Chairs, evaluate strategic centers of excellence for clinical development and opportunity in adult and pediatric area.
3. With VP and Senior Associate Deans, seek ways to optimize and enhance education, research and clinical care goals and initiatives with community partners and affiliated institutions, especially the VA and Santa Clara Medical Centers.
4. With VP, CEO's and Chairs, determine the expectations, incentives and rewards for physicians who are clinicians, clinician/teachers, clinician-scientists.
5. Critical evaluation of finance and administration and related funds flow between the medical center, medical school and university.
6. With VP, CEO's and Chairs, critically assess the financial and organization structures guiding in-patient and ambulatory care in order to optimize the efficiency, quality and service of care delivery in tandem with the education and training of students, residents, fellows and faculty.
7. Evaluate the development of a faculty practice plan or related business models under the leadership of the Senior Associate Deans for Clinical Affairs.

Advocacy, Community Service and Public Policy

1. Use the office of the Dean to engage Community, State and Federal government around issues impacting the missions of the Medical School and Medical Center.
2. Promote opportunities for students and faculty to improve community benefits and relationships in order to align the school and medical center with local and regional neighbors and communities.

Academic and Career Development

1. Critically reassess and, where appropriate work to change, the current guidelines and structure for academic appointments and promotions. The goal should be to

- recognize and enhance career development that values the important roles played by clinicians, researchers and teacher/scholars.
2. Assess and optimize mentoring at all levels of career development.
 3. Create an Office for Women in Medicine and Science which oversees career development, salary equity, recruitment/retention and the diverse challenges and needs of the workplace.
 4. Create an Office for Minority Student and Faculty Diversity that works in parallel with the Office for Women in Medicine and Science to enhance and promote the same issues.
 5. Seek ways to overcome impediments to achieving more optimal work/family balance within the School and Medical Center. For example, this should include an assessment of services for infant, child and sick-child on-site care.
 6. Critically reassess the reappointment process surrounding the review of Departments and their Chairs.

Achieving these goals will take work, coordination and time. Moreover, faculty, students and other members of our community will propose additional challenge or opportunities to pursue. Naturally, it will require prioritization and focus to achieve our goals, but we must begin with a plan of direction. I have therefore outlined some of the broad directions that I think are important and look forward to working with you to help achieve these and others that we deem important. There is no doubt that we face some difficult choices and challenges but I do believe that if we are as unified as we can be, the future can be bright, and Stanford University Medical School can be the source of illumination.

Dean's Newsletter

April 16, 2001

Goals for Future Newsletters

Hopefully you have received and had an opportunity to review the first issue of the Dean's Newsletter in which I outlined some of the strategic initiatives I envision for the Medical School during the next several years. In the future, all issues will be posted on the Medical Center Home Page. I welcome your input and was pleased to receive comments regarding the April 2nd Newsletter from medical and graduate students, postdoctoral fellows, junior and senior faculty and department chairs. Their comments were very helpful, affirming the various directions I had outlined, as well highlighting some areas or issues of priority.

Future Newsletters will report various events or issues as I see them. I am currently planning on sending a Newsletter every other week, generally on Mondays, during the academic year. Again, I am providing these communications largely for information but welcome feedback or suggestions. The success of our future efforts will surely be

enriched by the active participation of our students, trainees, faculty and staff in defining the success of our school. Also, if you have comments or suggestions as well as announcements of events of general interest, or notice of honors or awards received by yourself or a member of your group, please let me know so that this good news can be shared with our whole community. Please address your queries and comments to: deansnewsletter@med.stanford.edu

Governance Changes in the Office of the Dean

In order to begin implementing the various strategic initiatives that I outlined in the [April 2nd Newsletter](#), it is essential that an outstanding leadership team be assembled within the Office of the Dean. During the last months, including before my official arrival, I have had discussions with many faculty and leaders regarding the School's Governance. This has led to some reorganization of responsibilities to better align key mission objectives.

Before I present the revised organizational governance, I want to thank the individuals who have served in key roles during the past several years. First and foremost is Dr. Gene Bauer who did an outstanding job in sustaining and enriching the School during the difficult transitions of the Stanford-UCSF merger and then de-merger. I am very pleased to be working with Dr. Bauer in his current role as Vice President for the Medical Center. I am also very pleased to be working closely with Mr. Mike Hindery who has done a truly superb job as Senior Associate Dean for Finance and Administration.

I would like to thank Dr. Richard Popp, who did such an excellent job as Senior Associate Dean for Academic Affairs, and Dr. Harry Greenberg for his numerous and important contributions as Senior Associate Dean for Research. Dr. Peter Gregory, Senior Associate Dean for Clinical Affairs and Chief Medical Officer at Stanford University Hospital, has also announced his retirement but has agreed to continue in his current role through August. Also, Dr. Phyllis Gardner has recently announced her decision to step down as Senior Associate Dean for Education and Student Affairs in order to pursue her interests in medical information technology and distance learning, areas where she has made very significant contributions.

In defining the new organizational structure and governance, my overarching goal has been to optimally align functions with key missions. A second but equally important goal has been to attract outstanding individuals who would engage other faculty, especially more junior faculty, to work with them. Finally, with rare exception, I felt it very important for individuals serving as Senior Associate Deans to do so for specific, albeit potentially renewable terms, so that they could also continue their primary work in research, education or clinical care. Accordingly, nearly all of these positions will be part-time. This means that accomplishing the work will require engaging new standing committees with administrative support.

Based on this, the new organization, recent appointments include:

Senior Associate Dean for Academic Affairs: Dr. David K. Stevenson, Harold K. Faber Professor of Pediatrics and Director of Neonatology and the Johnson Center, will begin officially on June 1st.

Senior Associate Dean for Research and Graduate and Postdoctoral Student Education: Dr. W. James Nelson, Munzer Professor and Chair of the Department of Molecular and Cellular Physiology will begin on May 1st. Professor Nelson plans to step down as Department Chair in order to devote the requisite time to this new position.

I am enormously pleased that Professors Stevenson and Nelson have agreed to assume these important new responsibilities. In the very near future they will be outlining the ambitious goals they will seek to accomplish and I will communicate these to you in future Newsletters.

In addition, plans are underway regarding the other important Senior Associate Dean Positions, including:

Senior Associate Dean for Medical Student Education. I am appointing an advisory committee to help find the very best individual for this enormously important position. I have communicated previously that education is among my very highest priorities and I look forward to working closely with the Faculty Senate, students, and faculty at large to develop a curriculum that respects flexibility and innovation and that trains thought leaders and physician-scientists. Accordingly, appointing an outstanding individual to this position is critical. We will not restrict our search to the Stanford community and I am interested in any suggestions that you might wish to share.

Senior Associate Dean for Clinical Affairs. As noted above, I am most appreciative that Dr. Peter Gregory will continue in this position through August. We are currently evaluating how to organize this important role to serve our clinical faculty in light of the many changes occurring within the Medical Center. Additional details are forthcoming.

Senior Associate Dean for Medical Information and Learning Technology. This position does not currently exist but we are examining its development in light of the enormous opportunities that exist and their impact on education, clinical care, research and communication.

Diversity and Minority Affairs

On Wednesday, April 4th I met with Drs. Fernando Mendoza, Gabriel Garcia, Ron Garcia, Ellen Porzig, Phyllis Dennery, Oscar Salvatierra and Ms. Charlene Hamada to learn more about the diversity and minority programs at Stanford. First I want to congratulate the individuals with whom I met about their impressive efforts to date. However, we all agreed that there is more that should be done to improve diversity among our community. Accordingly, I charged this group to consider what additional steps might be pursued and whether these could be more successful under the auspices of an Office for Student and Faculty Diversity within the Office of the Dean. I will report back to you about this most important issue in a future Newsletter. If you have interests or opinions to offer that will help further this review, please contact Dr. Fernando Mendoza.

Update from the Medical Center

As you surely know from the local newspapers and from various internal communications, the Medical Center and especially Stanford University Hospital, is

experiencing serious financial challenges in the wake of the failed merger with UCSF. This has resulted in very significant projected losses from operation, on the magnitude of \$40 million dollars in FY01 (the current fiscal year, which ends on August 31, 2001) and the potential for even larger losses in FY02. To address these critical challenges and reduce the projected operating losses, a "Turnaround Committee" chaired by Dr. Gene Bauer has been assembled that includes Hospital CEO's, Hospital Finance and Operations, the Dean, and senior faculty to address every approach possible to improving the current serious scenario. If unabated, continuation of such losses could threaten the financial viability of Stanford University Hospital. The Committee is working aggressively to reduce these losses. It is important to recognize that while the Lucile Packard Children's Hospital is part of the Medical Center and also faces the severe challenges from managed care and health care reimbursement system in northern California, its overall financial health is more secure at this time.

As you may also know, because of the recent announcement by Malinda Mitchell, the current CEO of SUH, that she will soon retire, a Search Committee has been appointed and is working with Korn-Ferry. An aggressive timeline has been established with the goal of appointing a new CEO for Stanford University Hospital this summer.

During the next 2-3 months, the Turnaround Committee will be addressing all programs within the Medical Center and, where necessary, making the difficult choices and decisions regarding their continued support. It is of course ironic that while this is happening, both Hospitals are filled with patients and yet are still losing money. This is because the reimbursement for the care provided pays only a portion of the cost of care. The real problem is the inadequate payment for care from insurers and HMOs, making the ultimate solution a fundamental change in health care financing. This will necessarily engage both private and public agencies (i.e., state and federal government) employees and consumers, and it will be important for our University and Medical School to take proactive stands for change. I will do my best to engage in these issues.

Executive Committee

The School of Medicine's Executive Committee includes Department Chairs and Senior Deans and has had the responsibility for reviewing academic appointments and promotions. Because this is the most senior leadership group in the School, I discussed at the April 7th meeting the important role that the Executive Committee should also play in overseeing issues and programs important to the Schools missions and future. In addition to the various topics that I outlined in my Strategic Initiatives that were shared with department chairs and faculty leaders, some of which are highlighted in the April 2nd Newsletter, I asked the Executive Committee to recommend topics that they felt important to consider in forthcoming meetings. Among those topics suggested by members of the Executive Committee include:

1. **Future goals of the educational program:** What type of physician should the School try to recruit and train? What is the mission? What is the admission process?
2. **Housing for students, postdoctoral fellows, and faculty:** How can the School help to address the housing problem?

3. **Space Planning Post-GALE:** Short- and long-term planning.
4. **Curriculum:** Defining the basic science and clinical science curriculum and postgraduate review.
5. **Relationship between the Executive Committee and the Faculty Senate:** Steps to be taken in order to avoid parallel planning and processing.
6. **Budget:** To gain a better understanding of the flow of funds of the School of Medicine and where the School is financially. How are operating budgets formulated? This item will need a series of serious discussions and review of all relevant data.
7. **Important issues affecting the School:** Discuss, deliberate and advise on important issues affecting the School of Medicine. Determine the process and discuss the goals, assuring quality within the faculty.
8. **Departmental issues:** Learn how other departments function. A short presentation by the department chair or representative.

If you have suggestions for additional topics that should be considered (other than those listed above or included in the [April 2nd Newsletter](#)) please let me know by responding to the above noted address.

Appreciation

During the past couple of weeks since my arrival I attended functions that I would like to acknowledge:

Dr. Thomas Quertermous, Professor of Medicine and his colleagues gave an impressive presentation on April 2nd to a Site Visit committee about the work they have accomplished since the inception of the Donald Reynold's Cardiovascular Clinical Research Center two years ago.

Dr. Branimir I Sikic, Professor of Medicine (Oncology and Clinical Pharmacology) and Program Director for the GCRC (General Clinical Research Center) and his colleagues did an outstanding job in preparing the grant and presentations to a Site Visit Team on April 10th.

Dr. Parvarti Dev, Director of SUMMIT and her staff, provided me with a wonderful introduction to the work they are conducting on the Web-based curriculum, the exciting research accomplishments in virtual reality learning, and the opportunities for developing a global campus. I was very impressed.

April 30, 2001

Executive Committee: Presentation by Professor James Nelson

At the Executive Committee Meeting on Friday, April 20th, Professor James Nelson, newly appointed Senior Associate Dean for Research, Graduate and Postdoctoral Education outlined some of his thoughts regarding the organization he proposes and some of the research themes he will be suggesting. The important principles outlined by Dr. Nelson include engaging a range of faculty of various ranks and appointments from both the basic and clinical science departments in helping to guide our institutional mission in research and graduate student and postdoctoral education. This will be accomplished through the appointment of a "research group" to both help develop and implement research initiatives; an "education group" to help guide programs in graduate student and postdoctoral fellow education; and a "compliance oversight group" to address conflict of interest, ethics, scientific misconduct, relationships with industry and liaison with the development office. The work of these Groups will be carried out through faculty lead Standing Committees that will work in conjunction with Associate and Assistant Deans.

Dr. Nelson and I are pleased to announce that Dr. Edward S. Mocarski, Professor of Microbiology and Immunology has agreed to serve as the Chair of the Standing Committee on Conflict of Interests and Ethics in Research. Dr. Mocarski will work along with Assistant Deans Mildred K. Cho and Barbara Flynn on this important Standing Committee.

We are also pleased to announce that Dr. Karla A. Kirkegaard, Associate Professor of Microbiology & Immunology has agreed to Chair the Standing Committee on Graduate Education and will work in collaboration with Dr. Ellen Porzig, the current Associate Dean for Graduate Education.

Appointments for leadership in other Standing Committees are forthcoming.

Dr. Nelson also discussed with the Executive Committee his plans to establish a number of faculty run research interest groups that will engage both basic and clinical science faculty. These groups will also form appropriate interfaces with other already committed interdisciplinary efforts (e.g., Bio-X, CCSR, Beckman Center and others). Some of the groups that Dr. Nelson discussed are already functioning or have constituencies that are currently being formed (e.g., Biocomputation, Neuro-X, Stem Cells/Bioengineering, Infectious Disease/Immunology, Genomics). He is also proposing new interest groups (e.g., Protein Networking, Chemicobiology/Synthesis, Post-Genomic Structure, Genetic Epidemiology/Policy, Molecular Machines, Cardiovascular Biology). This is not an exclusive list and Dr. Nelson will be seeking faculty participation and input for additional suggestions or recommendations. He also announced his plans to establish a Web Page "Research Bulletin Board" for the School of Medicine to facilitate information exchange and feedback among and between faculty members.

Feedback from the Executive Committee for Dr. Nelson's plans was enormously positive. I know that he is interested in receiving additional input from faculty as well

Update on Hospital Issues

A considerable amount of attention and concern is understandably directed at the ongoing financial challenges of the Stanford Hospital & Clinics. As noted in the April 16th Newsletter, the Turnaround Committee is working actively to reduce the ongoing losses for the remainder of FY'01 while also working toward a "breakeven" budget for FY'02 (the year beginning September 1, 2001). A number of approaches are being utilized, ranging from operational improvement as well as some of the external forces (i.e., payment for services) that have led to the current fiscal crisis. As you know from the numerous news articles during the past weeks, the projected loss from operations just a couple of months ago was over \$40 million. The various very difficult decisions made in the interval by the Turnaround Committee seem likely to reduce this FY'01 deficit to less than \$20 million, recognizing that there is still considerable work to be done to sustain even these improvements.

As important as the improvements are for FY'01, so too is the planning for FY'02. The impact of the decisions being made now are significant and their implementation will require the unfaltering commitment of physicians, hospital, school and university to work diligently and together. In recognition of these issues, the Faculty Leadership Group (FLG), which consists of all of the Chairs of the School's Clinical Departments, together with six elected representatives of the School of Medicine's faculty at large, offered a signed statement to President John Hennessy to be shared with the University's Board of Trustees. The statement represented a commitment by this important leadership committee to "work in true partnership with the leaders of the School of Medicine, the management of the hospitals, and with President Hennessy and other University leaders to establish a strategic plan that is both fiscally sound and academically responsible". Some of the comments and recommendations excerpted from this statement, which was shared with the University Trustees during their recent Retreat (see below) included the following:

- The nation's Academic Health Centers (AHCs) are in crisis.
- The financial challenges to academic health care are well known to those within the School of Medicine.
- We (the FLG) view as fundamental to any effective plan that the University retains ownership of the hospitals.
- We (the FLG) are not aware of another academic medical center in the country in which the organizational and physical infrastructure creates a closer and more productive relationship between clinicians, medical scientists and engineers.
- Given its pre-eminence in research and the strength of its faculty, Stanford can continue to be a world leader in the achievement of fundamental progress in basic (research), translational (research) and clinical medicine
- Aware of the seriousness of the financial circumstances that confront us, we (the FLG) commit to working closely with the leaders of the School of Medicine, the hospital, and the University to establish a strategic plan for the Medical Center that is both fiscally sound and academically responsible.

This expression of recognition and support is appreciated and important. Indeed, while it is true that AHCs across the country are experiencing significant financial challenges, our attention at this critical juncture must be focused on Stanford, and it is imperative that our faculty be united in helping to address the current and future problems of financial solvency of our Medical Center. It is true that faculty leadership, especially our clinical department chairs, is imperative to this solution. Importantly, the participation of every faculty member, whether in a clinical or basic science department, is needed as well. Although the current losses are largely in SHC, and much less at the Packard Children's Hospital, the stark reality is that the Hospitals, School and University are interconnected. It is not possible to simply isolate a part of the enterprise. Moreover, it is important to recognize that the financial losses in one sector impact all others.

In fact, the Medical Center was one of the four major topics being reviewed by the Board from Monday April 23rd through Wednesday, April 26th. As part of this review, which Dr. Eugene A. Bauer and I participated in, the various flows of funds between the Hospitals, School and University, was a topic of considerable discussion. There is no question that the University leadership values the School of Medicine and its Medical Center. There is also no question that the current fiscal challenges are of concern and will remain a topic of continued review. Even acknowledging that the cause of the crisis emanates from a failed health care finance system, the University leadership as does the School recognizes that physician leadership is an essential part of the solution. Accordingly, the expression of support by the clinical Faculty Leadership Group is important and appreciated.

Translating these expressed intentions into operating outcomes is important. I have asked Dr. Peter B. Gregory, Senior Associate Dean for Clinical Affairs, to work with the FLG and hospital leaders to further develop the best ways to implement physician leadership that is both responsible and accountable to the faculty and hospital as well as the school and university. Given the very significant reductions in service payments to the clinical departments and School for both FY'01 and FY'02, such accountable and responsible leadership will be essential. Equally, such leadership should also help guide creative solutions that transcend expense reductions per se and that offer new programmatic and strategic opportunities for clinical care and related academic programs.

Visit to Palo Alto VA Hospital

On Tuesday April 17th, Dr. Peter Gregory, Senior Associate Dean for Clinical Affairs and I visited with the Administration and a number of the Department Chairs at the Palo Alto Veteran's Administration Hospital. This was an introductory meeting and we are planning additional monthly visits. The VA Hospital is an enormously important and valued affiliation, playing an extremely important role in undergraduate and graduate medical education as well as clinical care and research.

Our discussions with Ms. Elizabeth J. Freeman, Director of the VA Palo Alto Health Care System, Dr. Javaid I. Sheikh, Chief of Staff and Associate Dean for Veterans Affairs, as well as a group of physician leaders at the VA, focused on opportunities for future program development between the faculties at SHC and the Palo Alto VA. It is

clear that there are a number of important opportunities for leadership at both sites and for potential synergistic interactions.

During the tour of the impressive facilities at the VA, we also had the opportunity to visit the simulation-learning center, an important and impressive model for training students, residents and faculty as well as for research and medical education.

Stanford Medical Student Research Symposium

On Friday, May 4th, beginning at 1:00 PM, the 18th Annual Stanford Medical Student Research Symposium will be held in the Fairchild Auditorium. Dr. Patricia C. Cross, Associate Dean for Preclinical Advising and Research and Dr. Julie Parsonnet, Associate Professor of Medicine will introduce and moderate the Symposium. An Award Ceremony will be held at 6:00 PM, presided over by Dr. Ross D. Bright, Associate Dean for Alumni Affairs.

When You're Sixty-Four

During an early morning meeting with Dr. Judy Swain, Chair of the Department of Medicine, the wonderfully talented medical student group "The Palpitations" swooped into my office to offer a cappella version (or forecast) of life marked by decreasing body parts and/or functions. Not taking that personally of course, I want to thank "The Palpitations" for a very talented "wake-up" song and the most unique welcome I have experienced to date at Stanford. Truly, they were great!

Founders Celebration

On Thursday evening, April 26th, I had the privilege to attend and speak at the Lucile Salter Packard Children's Hospital Annual Foundation Dinner. This year LPSCH will celebrate its 10th Anniversary. Thanks to the extraordinary support of the Packard Family and Foundation and the remarkable contributions by donors (a number of whom attended this dinner celebration), the Packard Children's Hospital is emerging as one of the centers of excellence in pediatrics in the nation. Its role as a pacesetter for pediatric clinical care, research and education will surely become even more significant and important during the years ahead. This is directly related to the very generous support that our community continues to provide to the Packard Hospital and its important programs. I am most indebted to all of these wonderful donors and supporters.

Appointments and Promotions

The Advisory Board and Provost's Office has informed the School of Medicine of the following promotions and appointments:

Promotions:

- David A. Relman to Associate Professor Medicine (Infectious Diseases) and of Microbiology and Immunology, with tenure, effective 4/1/01
- Michael Ward to Associate Professor of Medicine (Immunology & Rheumatology), with tenure, effective 4/1/01

- Ingela Schnittger to Professor of Medicine (Cardiovascular Medicine) at SUMC, effective 4/1/01 and for a continuing term.
- Stefanie S. Jeffrey to Associate Professor of Surgery at SUMC for the term 4/1/01-3/31/06

Appointments:

- Charles A. Taylor to Assistant Professor of Mechanical Engineering and of Surgery effective 4/1/01-3/31/05
- Congratulations to each.

Congratulations to Dr. Roger D. Kornberg

Dr. Roger D. Kornberg, Professor in the Department of Structural Biology, has been named the 2001 winner of the prestigious Welch Foundation Prize for Chemistry in recognition of his work on transcription.

Dean's Newsletter Goes Live!!

As of today, past and present Newsletters can be accessed via the URL:

<http://deansnewsletter.stanford.edu/>

In addition, there will be a link from the School of Medicine Home page, from the Local Home page, the Medical Center index page, the site map and the school department's page. We will, however, continue to email the Newsletter directly to you.

Dean's Newsletter May 14, 2001

Stanford Medical Student Research Day

On Friday, May 4th forty-three platform or poster sessions were presented by Stanford Medical School students in the Fairchild Auditorium. The topics ranged from basic to clinical science and engaged faculty from throughout the School. After the presentations and poster viewing, a selection committee chose six students for special recognition. Before announcing the Award winners, I want to underscore that each of the students who carried out research and presented their findings is a "winner" in my opinion. That said, the Award Presentations were divided as follows:

Poster Presentations

First Place:

Sarah A. Beckman for "Associated risk factors for hepatitis C prevalence and response to hepatitis B vaccine in acute leukemia patients at the National Children's Hospital in San Jose, Costa Rica". Other authors include Y. Maldonado, J. Carillo, M. Navarrete, L. Taylor and K. Visona.

Second Place was tied:

Amarjit Dosanjh for "Isolation of arteriolar and venular microvascular endothelial cells from postembryonic skin". Other authors include S. Naghshineh, L. Zhou, and M. Karasek.

Joshua Eby for "Caveolin-3 mutations in limb muscular dystrophy interfere with integrin signaling". Other authors include M-H Disatnik, B. Dueul, K. Langenbach and T. Rando.

Oral Presentations:

First Place:

Nirav R. Bhakta for "Calcium signals mediating thymocyte selection: imaging thymic slices". R.S. Lewis was co-author.

Second Place was tied:

Jeff Goldberg for "CNS regeneration: an irreversible neonatal switch from axonal to dendritic growth in the developing CNS". B. Barres was co-author.

Jacqueline Nerney Welch for "Real time freehand 3D ultrasound system for image-guided surgery". Other authors include J. Johnson, M. Bax, R. Badr and R. Shahidi.

Student Luncheon and Related Events

On Thursday, May 10th I was pleased to hold a luncheon on the Fairchild Lawn for medical and graduate students. This provided an informal opportunity to meet with students and learn more about the great affection they hold for Stanford – as well as some of their concerns. The latter include the need for curriculum reform, teaching during clinical rotations, education facilities, diversity of the student body and faculty, involvement in community service, housing (and for post-docs, stipends) and, worries about the financial well-being of the Medical Center. In addressing some of these issues with the students who attended, I informed them of my plans to have a regular informal luncheon series for small groups of medical and graduate students as a means to get to know them better and to engage with these and related topics.

I was pleased to learn that on Thursday evening, May 10th, Professors Bill Mobley (Neurology), Harvey Cohen (Pediatrics), Suzanne Pfeffer (Biochemistry) and Maury Druzin (Obstetrics/Gynecology), representing the faculty, along with leaders of the Stanford Medical Alumni Association, met with First and Second Year Medical Students (at their request) to discuss the establishment of a mentoring program. This group plans to engage a broader group of faculty, alumni, students and members of the Dean's Office in developing a mentoring program to commence in the next academic year. This is a wonderful and important initiative stimulated by our students and is deserving of our support.

Provost's Task Force on University Needs

On Tuesday, May 2nd, I presented the School of Medicine report to the Provost's Task Force on University Needs. This Task Force is evaluating the capital and programmatic plans of each of the University's Schools that are anticipated over the next decade or more. Because of limitations on land use, the Provost's Task Force will assure that critical priorities for both Schools and the University are aligned as best as possible.

In my presentation I reviewed how the School of Medicine's strategic initiatives in education, research, clinical care would impact on career development and both programmatic and facilities needs. Given the termination of the GALE project in early March, I underscored our need to prioritize facilities plans within the School and to focus first on a Learning and Information Center. I further outlined our plans to conduct a detailed facilities review to assess current space utilization as well as projected needs and opportunities over the next 5-10 years. This will help assure the optimization of our Stanford Medicine campus and its important relationship to the University for the 21st Century. I also noted the need to critically assess information systems within the Medical School and their functionality and relevance to key missions and relationships (e.g., between basic and clinical staff and among Medical School, Medical Center (including community partners) and the university). Finally, I highlighted the need for the School of Medicine to participate with the University in developing affordable on campus housing for students, trainees, faculty and staff.

Achieving these programmatic and facilities needs is impacted by our financial challenges, particularly in the Hospitals. This underscores the importance of the current work going on in the Hospital Turnaround Committee (see below) and the critical importance of philanthropy to help support our mission-critical programs in education, research and clinical care.

During the next weeks the Provost's Task Force will begin the process of summarizing and then ultimately prioritizing the various facilities plans and proposals, including those of the School of Medicine. I will comment further on this as information unfolds.

Stanford Medical Alumni Reunion

May 3-5th marked the Reunion for the graduating classes beginning 1951 along with the "senior classes" prior to 1950. More than 200 alumni returned to Stanford to participate in classes, attend lectures, tour the hospital and research facilities and meet old classmates, friends and colleagues at various social events. Special thanks go to Robert Cody, MD '57, the 2000-2001 President of the Stanford Medical Alumni Association and Ross Bright, MD '58, Associate Dean for Alumni Affairs, for coordinating the program and for making graduates young and old feel welcome and informed. Thanks also to members of the Development Office for all that they did to make the events so successful. Although my personal matriculation to Stanford is measured in only 5 weeks, I felt the esteem that Stanford graduates have of their alma mater.

The Alumni weekend began with the Senior Luncheon on Thursday May 3rd for Members of the Class of 1950 or earlier. I had the pleasure to interact with many of these alumni and learn about the medical school experience that included preclinical training on the Farm followed by clinical rotations in San Francisco. These senior graduates have also witnessed the tremendous progress that has occurred during the past 50 years in healthcare and biomedical research as well as some of the negative societal and economic forces that have eroded the perceived value of medicine as a profession. But they share a hope and optimism for a better future and the role Stanford can play in securing that.

In addition to classes on a variety of medical topics, including medical education and research venues, alumni attended an exciting Saturday morning Symposium entitled “What’s New? Recent Advances in Research and Clinical Medicine”. I want to thank the speakers at this symposium, Drs. Harvey Cohen (Pediatrics), Thomas Krummel (Surgery), Sandy Nepel (Radiology) and Paul Yock (Cardiovascular Medicine). I also want to thank our faculty who conducted various “Classes Without Quizzes” including Drs. Helen Bronte-Stewart (Neurology), Louis Halamek (Pediatrics), Christopher Payne (Urology), Charles Taylor (Surgery and Mechanical Engineering), Martha Terris (Urology), Chris Zarins (Surgery), Ron Davis (Biochemistry and Genetics) and Theo Palmer (Neurosurgery).

Update on Hospital Issues

Work continues on a number of fronts to address the financial issues challenging the Medical Center, especially Stanford Hospital and Clinics (SHC), I won’t repeat information already reported in the news media, including internal communications, regarding the decision of the Medical Center to exit capitated care plans. However, a couple of other updates are of note.

The Turnaround Committee continues to closely monitor the FY01 budget and the final planning for the FY02 budget. Although improvements in the FY01 budget have occurred with the various program closures, etc, SHC still faces a deficit of nearly \$20 million. This makes all the more important the effective planning for FY02 (the year beginning in September 2001). One of the important elements is this budget is accurate prediction of volume, especially in the “centers of excellence” that include neuroscience, cardiovascular, oncology and surgical services. Detailed reviews of volume projection are essential to an accurate budget forecast, since the related patient care expenses (personnel, supplies, etc.) follow accordingly. By the May 9th Turnaround Committee meeting, the group completed its review of each of these key areas and will next address the volume projections in all other medical and surgical areas, with surgery having presented on May 2nd and Oncology on May 9th. In addition, the Committee is addressing ways to improve patient service and to reduce roadblocks or impediments to evaluation and care.

Two areas will require considerable review for FY02 budget allocations. The first falls into the area of “strategic support” and represents a flow of funds from the Hospitals to the School of Medicine’s clinical departments for various professional services rendered. As with many academic medical centers, such support has historically been used to help fund faculty recruitment, cover medical direction (i.e., clinical leadership that is essential for hospital functions but not otherwise reimbursable), help fund new clinical program development or provide funding for clinical services that are not otherwise affordable through professional income. Because such hospital transfers often become encumbered by various historical agreements, it is important to set standards and re-base such hospital support. Accordingly, the VP, Dean and Hospital CEOs, in collaboration with the Turnaround Committee, have charged a group of subcommittees to address the distribution of Hospital support for important “purchased physician services” based on

clear guidelines and principles. These Committees will complete their work during the next 2-3 months. Updates will follow regarding this important but understandably sensitive issue.

Also, at the Internal Governing Council on Friday May 11th, I again addressed the importance of further defining physician leadership, including its requisite responsibility and accountability, for both SHC and the Packard Children's Hospital. A committee has now been charged to help define the important role that physician leaders must play in the governance and organization in the Stanford Medical Center. A report from this Committee (which will include both Department Chairs and Hospital Administration) is expected within the next 2 months.

News Media and You

As you certainly recognize, Stanford Medical Center has been in the news a good deal lately. Not only is Stanford Hospital's financial struggle receiving considerable print and air coverage, but (thankfully) so too have many of the School's accomplishments in education and research. I think it is important to keep our profile and image high to ensure that the excellent work being done by our faculty and students gets the appropriate notice. To help achieve this goal, your help is needed.

Should a member of the News and Public Affairs Staff, led by Mr. Ritch Eich, call you or a member of your department, please be certain that calls are taken and responded to promptly. Furthermore, please encourage faculty members to alert the News and Public Affairs Staff (call 36911) regarding upcoming research publications (they will assure that embargoes are not broken) as well as important presentations at national meetings or other exciting developments you think are important. We have much to be proud about and the News and Public Affairs staff can help communicate this to our communities locally and nationally.

Executive Committee: Report from David Stevenson

As you know from previous announcements, Dr. David Stevenson, Harold K. Faber Professor of Pediatrics and Director of Neonatology and the Johnson Center, has been selected to serve as Senior Associate Dean for Academic Affairs. Although Dr. Stevenson will not officially begin his new responsibilities until June 1, 200, he has been quite busy already in helping to outline the various initiatives he plans to pursue. At the May 4th Executive Committee meeting, Dr. Stevenson presented some of his plans. These include re-examining the appointments and promotions process. In particular, how to make the process run more smoothly and efficiently. He also plans to examine the search process and the understandable faculty concerns regarding the Principle Investigator (PI) waiver for MCL appointees. In addition, Dr. Stevenson plans to examine the leave policy, focusing on family and gender issues, and seeking to identify ways to be flexible without compromising academic standards. He also plans to revisit the issue of part-time appointments.

Members of the Executive Committee also posed some issues that they would like to see addressed, including: When is it appropriate for a department to propose a faculty

member for promotion? What is the role of a clinician-scientist or a basic science researcher? How to encourage the faculty of the School of Medicine to serve as members on University committees and other University activities in order to educate the rest of the University about the roles of the medical school faculty? How to deal with difficult tenure decisions and various issues surrounding the Medical Center Professoriate?

Again, updates on progress in these areas will be announced as they come forward.

Clark Center Update

Plans for the Clark Center Design and Construction continue to move forward. As you likely have already noted, the tunnel structure is moving forward and will be completed in early July. What you may not be anticipating, however, is that site excavation will begin right after graduation, June 18th. You will definitely notice since parking will no longer be permitted after that time. The Clark Center is due to be ready for occupancy by August 2003. Updates on program planning will be forthcoming.

Congratulations:

Dr. Alan Schatzberg, Kenneth T. Norris, Jr. Professor and Chairman of the Department of Psychiatry and Behavioral Sciences received the prestigious Edward Strecker, MD Annual Award from the University of Pennsylvania and The Pennsylvania Hospital for his “outstanding contribution to the field of clinical psychiatry”. The Award was presented on May 6th at the annual meeting of the American Psychiatric Association Meeting. Please extend your congratulations to Dr. Schatzberg.

Eugene C. Butcher, M.D., Director of the Serology and Immunology Section, Pathology and Laboratory Medicine Service at the VA Palo Alto Health Care System, and Professor of Pathology at Stanford, has been named the recipient of the 2000 William S. Middleton Award in recognition of his achievements in the field of immunology. The William S. Middleton Award, which was established in 1960, is given annually to honor the best scientist in medical research in the entire VA system nationwide. Please join me in offering congratulations to Dr. Butcher.

Gabriel Garcia, MD, Associate Professor of Medicine (Gastroenterology) and Director of Medical School Admissions, has been named the next Chair of the AAMC Western Group on Student Affairs.

Appointments and Reappointments

The University Advisory Board recommended the following decisions on May 10, 2001:

Randall Stafford was appointed Assistant Professor of Medicine (SCRDP) for the term May 1, 2001-June 30, 2004

Paul Buckmaster was reappointed as Assistant Professor of Comparative Medicine and of Neurology and Neurological Sciences for the term May 1, 2001-October 31, 2004

Congratulations to both Drs. Stafford and Buckmaster.

Dean's Newsletter

May 29, 2001

Executive Committee: An Overview of the Financial Landscape and Challenge Facing Stanford University School of Medicine.

At the Executive Committee Meeting on Friday May 19th, I reviewed with Department Chairs and other faculty leaders some of the broad financial factors and challenges that currently impact the missions of academic medical centers, including Stanford. I will review a portion of this discussion with you in this Newsletter. *I would strongly recommend that you read this presentation and become familiar with the issues being discussed.*

Although their balance varies, medical schools have four major missions: education, research, clinical care and community service. These discrete missions are unified under the general umbrella of an “Academic Medical Center” (AMC) and their interrelations can vary from school to school. There are 125 medical schools in the USA that are associated with both private and public universities. Some, such as Stanford, are “research intensive”, whereas others have a greater emphasis on clinical training or community service. Except for the Uniformed Services University for the Health Sciences in Bethesda, Maryland, which receives support through the federal government, the public schools are affiliated with state universities and receive various degrees of support from that association (e.g., UCSF is such an example).

Of course Stanford University School of Medicine is part of an extraordinary private university, but even within the University, it also has some unique features. Along with the School of Business, the School of Medicine is a “formula” school at Stanford and as such is responsible for its overall financial performance. Accordingly, it does not receive general operating dollars from the University *per se*, and maintains its own reserves and endowment to help support its mission. There are, however, a number of important financial, administrative and academic relationships that flow back-and-forth between the University and the School of Medicine. Overall these provide strength and excellence to the entire enterprise.

As do other medical schools, Stanford University School of Medicine and Medical Center supports four major missions: education, research, clinical care and community service. Although each of these four missions have different sources of funding, and different expenses they must bear, there are many interrelations among them. In many ways, the missions are inextricably linked and even interdependent. At Stanford, the

emphasis on research, and the excellence of its students, faculty and programs, makes it one of the very best schools in the nation.

To better understand the financial challenges facing AMC's in general and Stanford specifically, I have listed below the general sources available to support key missions.

	Sources (Revenue)	Uses (Expenses)
EDUCATION :	Student Tuition	Faculty/Staff Compensation
	Gifts	Financial Aid
	Endowment Earnings	Facilities Operations and Maintenance
	Earnings on Reserves	Academic Support Services
	Patent Income	General Administration
	Dean's Tax	
RESEARCH:	Direct Research Funding	Faculty/Staff Direct Research Compensation
	Indirect Cost Recovery	Facilities Operations and Maintenance
	Gifts	Academic Support Services
	Endowment Earnings	General Administration
	Earnings on Reserves	Unfunded Faculty Research Time
	Patent Income	Indirect Cost Recovery (Formula)
	Dean's Tax	
PATIENT CARE:	Professional Services Income	Faculty Physician Compensation
	Gifts	Facilities Operations and Maintenance
	Endowment Earnings	Clinical Staff Compensation
	Earnings on Reserves	Practice Expense
	Patent Income	Hospital Allocated Costs
	Dean's Tax	
	Clinical Program Development	
	Clinical Service Payments	

What do some of these terms mean and how do they relate to the School's current financial landscape?

Sources or Revenues

- **Student Tuition** includes the payments to the University for the student's enrollment and matriculation. The University transfers these payments to the School of Medicine.

- **Gifts** are contributions to the School for either a specific purpose (“restricted”) or for discretionary use (“unrestricted”) to support missions in education, research, clinical care.
- **Endowment Earnings:** a percentage from the interest earned from endowment (generally 5 %) is made available for support of missions. In the School of Medicine both the Departments and the School hold endowments and these are either restricted or unrestricted.
- **Earnings on Reserves:** Income in excess of expenses can be held in reserves and these reserves can earn income from investments. The Medical School’s Basic and Clinical Departments as well as the School and the Hospitals (SHC and LPCH) hold reserves that vary in size and utilization.
- **Patent Income:** When a discovery yields royalty payments, the money is distributed to the School, the department and the patent holder. These earnings can generally be used to support key missions.
- **Dean’s Tax:** The Professional Income (i.e., that which is billed and collected by physicians) from the School’s Clinical Departments is taxed directly and generally referred to as the Dean’s Tax. In most medical schools this is 10% of the “professional income”. At Stanford the Dean’s Tax is currently 6.1% of the professional income of the clinical faculty/departments. The Dean’s tax is used as a discretionary source to support basic and clinical science programs, initiatives and missions.
- **Direct Research Funding,** whether from Federal (e.g., NIH) or non-Federal (e.g., foundations, industry) is the payment to support faculty/staff/trainee salaries and/or research supplies
- **Indirect Cost Recovery (IDC),** whether from Federal or non-Federal sources, the IDC supports infrastructure costs (e.g., building services, administration, etc). The IDC has a calculated and negotiated rate with the federal government (i.e., NIH) as a percentage of the “direct research funding”. The IDC varies among non-Federal sources but generally falls below the negotiated federal rate and thus requires additional institutional support.
- **Professional Services Income** refers to payments from payers (e.g., HMOs, insurance companies, state (e.g. Medi-Cal) or federal sources (e.g., Medicare). These payments include support to the hospital or clinic (sometimes referred to as Part A) and professional income (e.g., for the services billed by MDs and other providers (e.g., Nurse Practitioners) and sometimes referred to as Part B. Of note, both the Hospital (net) collections and professional collections are only about a third of the “gross charges” for care. Moreover, as noted elsewhere, these payments almost always fall below the costs for rendering the care.
- **Clinical Program Development** generally includes support from the Hospital (as a transfer to the School’s Clinical Departments) to support new program development (e.g., a new or expanded clinical service that may require additional medical staff) whereby an investment is needed to get the program up and running
- **Clinical Service Payments:** These include payments by the Hospital that are transferred to the Medical School’s clinical departments to cover the expenses

related to physician supervision of necessary (albeit not reimbursable) services. This might include supervising a clinical laboratory, clinical program or an essential or mission-critical clinical service.

Uses or Expenses

- **Faculty/Staff Compensation** refers to the payment of faculty and staff salaries, including benefits. For the School this includes everyone: basic and clinical faculty, medical school and hospital staff.
- **Financial Aid** is support that offsets the costs for education and can come from either direct grants or loans. As noted below, Stanford has one of the most robust student aid programs in the nation. Clearly this is important for our students and their future, but it does require the use of School endowment funds to support this important need.
- **Facilities Operation and Maintenance** are the costs for operating land and buildings. Of note, the recent increased costs for energy add additional strain to this budget
- **Academic Support Services** are the programs that support the educational programs of medical students and graduate students. These programs include student services and Lane Library.
- **General Administration** is the support for Medical School administration. These can be central or departmentally based administrative services.
- **Practice Expense** includes the costs for staff (e.g., nurses, social workers, etc.) as well as supplies (e.g., medications, operating room supplies, etc.) to operate a comprehensive clinical program in both an inpatient and outpatient setting.
- **Hospital Allocated Costs** (a.k.a. “overhead) includes costs for space, administration, etc.) through a complex step formula.

The challenge facing AMCs, including Stanford University School of Medicine, is that the costs for education and research cannot be met by the tuition or research dollars alone and thus other sources are needed. For example, tuition payments cover only approximately a third of the expenses associated with medical education. Moreover, even though Stanford faculty achieve the highest per capita level of competitive grant support than any other medical school in the nation, there is still a shortfall of 10-20% of research expenses that are not covered from the direct or indirect dollars from research grants. In the past, clinical income was one of the sources used to help support the missions in education and research in academic medical centers. Today, that is increasingly difficult or impossible. Indeed, as you have read repeatedly in the newspapers, the revenue to pay for clinical care, especially in teaching hospitals that care for complicated patients or the uninsured, is not met by current insurance payments. Thus the dilemma and challenge facing academic medical centers today.

The relationships within AMCs vary at different universities and medical schools in the USA. In most American Medical Centers, the education and research programs reside in the medical school. Some medical schools “own” their teaching hospital whereas others have affiliations with hospitals that are independently owned and operated. Some teaching hospitals also have large research operations, including basic and clinical

science programs. Certain teaching hospitals are governed by Boards of Directors (i.e., Trustees) that are independent and separate from the medical school or university, whereas others have overlap or even joint governance. Each model has advantages and disadvantages, and the relationships between teaching hospitals and medical schools have evolved and changed during the last decades, influenced largely by the overall mission of the university and school as well as regional and local factors, cultures and, of course, financial support. Quite naturally, the relationships are either enhanced or strained when the funding sources for the interrelated missions are robust or limited.

The organizational interrelationships at Stanford are unique and enormously important for the future success of the School and the optimization of the health of our communities, locally and globally. At Stanford, both the Stanford Hospital and Clinics (SHC) as well as the Lucile Packard Children's Hospital (LPCH) are non-profit public benefit corporations affiliated with Stanford University. SHC and LPCH are led by separate CEOs but share selected administrative functions. Each Hospital is also governed separately by a Board of Directors, although there is overlap in composition.

The primary purpose of SHC and LPCH is to “support, benefit and further the educational, scientific and charitable purposes of the Stanford University School of Medicine”. Accordingly, SHC and LPCH are intimately and integrally related to the missions of the School of Medicine: the education and training of future physicians, and the acquisition of new knowledge through basic and clinical research that ultimately benefits the health of adults and children through high-quality and cost-effective health care services. These important affiliations, shared missions, and joint governance help assure that the discoveries which emerge from our research programs, now and in the future, will be available to patients cared for at SHC and LPCH. That will help assure that our community within Stanford, and its surrounding regions, benefit from excellent care and new discoveries.

However, these important relationships are clearly challenged in the current fiscal environment. Since education and research require supplemental support to sustain their excellence, new approaches must be found to help pay for these essential missions. This is also true for clinical programs that are not adequately and appropriately compensated in the current healthcare marketplace. However, because of the overlapping and intertwined flow of funds between the Hospitals and the School as well as with the University, shortfalls in one area create challenges in another. For example, as the current SHC operating budget has been in deficit, largely because of inadequate payments from HMOs and the government for clinical services, a reduction in payments from the Hospital to the clinical faculty for professional services has occurred. When that happens, it creates a challenge for the clinical departments and for the School to help make up these deficits. While such changes in funding create tensions and even divisiveness, they compel us to focus on our primary missions and to find ways to work creatively to assure they are sustained.

This will require making choices. Choices in the nature and scope of our educational programs, in the focus and size of our investments in research, and in the scope and depth

of the clinical programs that are provided. I outlined some of the areas of strategic focus and investment I think are important for the School of Medicine in my initial Newsletter (April 2, 2001) that is available on the Medical Center Homepage.

Choices are also necessary in our clinical programs, focusing on those we can do uniquely and well, and in a manner that complements those services offered by other providers in our community. At this juncture, the primary areas of focus for both the adult and pediatric clinical programs will be in Cardiovascular Diseases, Cancer, Brain and Behavior and Surgical Specialties. Wherever possible, these clinical centers of excellence will be enhanced by basic and clinical research agendas. Naturally this means that some other important areas of medicine will be de-emphasized at Sanford, largely because they can be offered by other providers or because they are not as prime for new development and innovation. This also means that we will need to work closely with our colleagues at the VA Hospital, Santa Clara Valley Medical Center and with other community partners to develop an integrated and more embracing academic medical center.

During this period of transition, however, one thing is absolutely clear. We must sustain the integrity and relationships between our Hospitals & Clinics, our School of Medicine and our University. This will require sacrifice and commitment by all. It will require rigorous management of hospital and school operations and resources. It will require accommodation to reductions in services that have been previously valued. It will require even more careful investments in program development, recruitment and capital expansion. It will require us to think rigorously about every decision that requires school or hospital resources and to do so with a Medical Center perspective, as well as that of a student, investigator, clinician or staff member.

The transitions in health care in general, and Stanford specifically, will also require time, patience and a community that is both deliberate, unified and committed. Although the financial challenges at SHC are significant and have an impact across the School and University, it is important that we stand with and behind our Hospitals. The problems they have encountered, especially at SHC, following the merger and de-merger, and in this difficult health care market, can and will be overcome. I am pleased that both our clinical and basic science faculty leaders have pledged their support to work on behalf of the Medical Center through this difficult period. I am pleased that our University leadership and Board of Trustees remain supportive. We have no choice but to work together to assure that future generations will benefit from the success of Stanford University School of Medicine and Medical Center.

Clinical Investigation Task Force

On Tuesday May 15th, Dr. Charles Prober, Professor of Pediatrics, chaired the first in a series of meetings for a Task Force I appointed to evaluate the resources and infrastructure needed to make clinical investigation as strong and successful at Stanford

as possible. Patient-oriented clinical research (which includes translational investigation and clinical trials as well as behavioral, epidemiological and health sciences research) requires institutional resources and commitment to optimize its success. Given the extraordinary opportunities now emerging in the immediate post-genomic era as well as those emanating from medical devices, information technology, and other clinical research venues, it is important for Stanford to seize these opportunities and become a pacesetter in clinical research.

Accordingly, Dr. Prober assembled nearly 50 individuals who expressed an interest in optimizing clinical research at Stanford and offered their insights and suggestions. The participating individuals came from the basic and clinical science faculty as well as from nursing and research administration. It is important to take note of the number of individuals who expressed an interest in clinical research and the various disciplines they came from.

In this first meeting, Dr. Prober requested that attendees comment on current impediments to conducting clinical research at Stanford along with suggestions for how to improve the opportunities. There were a number of important suggestions as well as considerable overlap in some of the areas of concern. Thankfully, many of the impediments (e.g., contracting delays, IRB reviews) that were raised are potentially solvable although resource utilization will need to be considered carefully.

Dr. Prober plans to meet biweekly and to have a report available within the next 2-3 months. If you have any suggestions to offer regarding clinical research at Stanford, please contact Dr. Charles Prober at CProber@stanford.edu.

Noteworthy Events

During the past weeks there were several celebrations commemorating success in important missions and accomplishments. Following are some highlights:

Student Financial Aid Dinner. Thanks to wonderful contributions from patrons for education, Stanford School of Medicine boasts one of the most generous grant-to-loan ratios of any medical school in the nation. This is of tremendous value to Stanford students, enabling them to graduate among some of the lowest debt burdens in the USA. On Tuesday evening, May 15th, faculty and students gathered for a festive dinner celebration at the Faculty Club to honor the wonderful donors who helped make the Student Financial Aid Program at Stanford so successful. It was a true privilege to witness how proud and committed donors and benefactors were about the students they helped support. It was equally wonderful to see how appreciative our students were about the financial support they had received and to learn more about the remarkable educational experiences they are having at Stanford. I was particularly pleased by the presentation of Cha Randle Jordon, George Matcuk, and Mary Pinder, who spoke eloquently on what the Financial Aid Program has meant to them and their families.

Wall Center Dedication. Thanks to an extraordinary anonymous gift of \$31.8 million, The Vera Moulton Wall Center was officially inaugurated at a celebration on Thursday May 17th. The Wall Center will unite the Lucile Packard Children's Hospital and the Stanford Hospital to help transform our knowledge and treatment of pediatric vascular disease in both adults and children. The Wall Center will support professorships as well as fellowships in both pulmonary medicine and bioengineering, and will promote interdisciplinary research and patient care in both children and adults. Special thanks go to the Center's Director, Dr. Jeff Feinstein, Assistant Professor of Pediatrics, Division of Cardiology and Dr. Romona Doyle, Co-Director of the Wall Center and Assistant Professor of Medicine, Division of Pulmonary Medicine and Critical Care. All of our heartfelt appreciation must go to the wonderful anonymous donor who helped make the Vera Moulton Wall Center a reality.

High-Tech High-Touch. On Thursday evening, May 24th, the Lucile Packard Foundation held its second High-Tech High-Touch Event. The theme was to demonstrate the important convergence of high tech research discoveries that impact the health of children in tandem with the importance of "high touch" supportive care that benefits children facing the challenge of serious disease. The event brought together parents, donors and pediatric faculty and featured show-and-tell demonstrations as well as wonderful presentations. I want to particularly thank Drs. Oscar Salvatierra, Professor of Surgery and Pediatrics and Dr. Allan Reiss, Professor of Psychiatry and Behavioral Sciences for wonderful presentations to an audience of families and donors. I also want thank Dr. Harvey Cohen, who epitomizes "high-tech high-touch" and served as the model host for the 'Packard Brand of Care'

Junior Faculty Gathering. Thanks to the Provost's Office, a gathering of junior faculty from the School of Medicine and Biological Sciences took place on Tuesday evening, May 22nd at the Faculty Club. This offered an opportunity for junior faculty to get to meet each other in an informal setting. Dr. David Stevenson, Senior Associate Dean for Academic Affairs and I represented the School of Medicine and were both pleased and privileged to meet new colleagues and learn about the exciting research they are conducting at Stanford.

The Asian Liver Center's Jade Ribbon Campaign. Nearly 15% of Asian Americans are infected with Hepatitis B and that of these, one-in-four will eventually die of liver cancer. Moreover, while Asian Americans represent only 4% of the current USA population, nearly 50% of the 1-1.5 million chronic hepatitis B carriers in the USA are Asian. To help address this important health disparity problem, Dr. Samuel So, Director of the Liver Cancer Program and of the Asian Liver Center at Stanford, has engaged with the Asian and Pacific Islander (API) American communities in the San Francisco area to develop a public awareness campaign regarding this problem. The Jade Ribbon campaign, which was launched officially on Monday, May 21st will consist of the

dissemination of public health information to the Asian community regarding knowledge about hepatitis B, its impact on health, especially in the Asian community, and its prevention. This is an excellent example of a program that addresses an important community health need. I want to congratulate and commend Dr. So and his colleagues for this important initiative.

Congratulations

Dr. Michael Levitt, Professor and Chair, Department of Structural Biology, was elected a Fellow in the Royal Society. The Royal Society was founded in 1660 to promote the natural and applied sciences and by election honors individuals who have made exceptional contributions. Professor Levitt's work on protein folding and computational analysis of structure is renowned and important. Please join me in congratulating Dr. Levitt.

Dr. Roeland Nusse, Professor and Chair of the Department of Developmental Biology has been elected to the American Academy of Arts and Sciences for his seminal work on the role of Wnt signaling in both development and cancer. Well deserved congratulations to Dr. Nusse.

Appointments and Promotions

- Promotion of **David J. Terris** to Associate Professor of Surgery, with tenure, effective May 1, 2001
- Promotion of **Mark A. Kay** to Professor of Pediatrics and of Genetics, with tenure, effective May 1, 2001
- Promotion of **Yueh-Hsiu Chien** to Professor of Microbiology and Immunology, with tenure, effective May 1, 2001
- Promotion of **Christopher K. Payne** to Associate Professor of Urology at SUMC for the term 5/1/00-4/30/06
- Reappointment of **Kenneth L. Cox** to Professor of Pediatrics at LPCH, effective 5/1/01
- Promotion of **Neyssa M. Marina** to Professor of Pediatrics at LPCH, effective 5/1/01
- Promotion of **Fernando S. Mendoza** to Professor of Pediatrics at LPCH, effective 5/1/01
- Reappointment of **Alistair G. S. Philip** to Professor of Pediatrics at El Camino Hospital, effective 5/1/01

Please extend your congratulations to each of these faculty members.

Dean's Newsletter

June 11, 2001

Commencement

Medical School Commencement will be held on Sunday, June 17th in the Dean's Courtyard. The official ceremony begins at 2 PM. This year's commencement speaker will be Dr. Gene Bauer. Please join us in celebrating the graduation of our medical and graduate students as well as the recipients of teaching and academic awards.

Also, please be aware that the Lane Medical Library's Instructional Facilities Group will present a live webcast of graduation. To watch the webcast, connect to the following URL:

[Http://www.med.stanford.edu/lane/ifo/medcommencement.html](http://www.med.stanford.edu/lane/ifo/medcommencement.html)

RealPlayer is needed to view the webcast. RealPlayer is available as a free download at:

<http://www.real.com/player/index.html?src+downloadr>

NIH Ranking in Research Awards

The faculty at Stanford University School of Medicine continues to excel in receiving competitive grants from the National Institutes of Health (NIH). For FY00, Stanford rose to 6th place in the NIH ranking, following Hopkins, Penn, Wash U., UCSF and Yale. Harvard is still the overall leader when its affiliated hospitals are combined with the medical school. Stanford's impressive position, which climbed to 6th place from 8th in FY99 is even more remarkable because its faculty is significantly smaller in size than any of the other research-intensive medical schools. For FY00 Stanford faculty received 428 research grants, 29 training grants, 47 fellowships, and 6 contracts. These are remarkable accomplishments.

Perspective on the Professoriate

At our Executive Committee Meeting on June 1st Dr. David Stevenson, Senior Associate Dean for Academic Affairs, reviewed the history and evolution of Medical Center Professoriate. This was poignant and relevant to the discussions that had arisen the prior afternoon at the University Faculty Senate. There are some converging issues: During the last decade the number of faculty in the MCL has risen disproportionately to other faculty positions in the University and School. At the same time, the role of the MCL faculty has changed, a large and increasing number of faculty are engaged in research and teaching in addition to the important work they perform in patient care. There is continued misunderstanding about the MCL faculty and the important role they play in our overall clinical and academic missions.

As a still relative newcomer to Stanford, I view the distinctions between faculty in an academic medical center as more of a continuum than sharply defined “lines”. Moreover, I consider the faculty to be equal in value and importance to the community of excellence we must continue to develop if we are to assure our success in education, research and clinical care. I am increasingly cognizant that the current structure (i.e., UTL and MCL) conveys separation and difference. I am also aware that these differences related to University policy transcend the authority of the Medical School per se. However, I know that Dr. Stevenson and I are committed to work toward a common Professoriate within the School of Medicine that recognizes, values and rewards faculty for their contribution as investigators and/or clinician-teachers. Each of these roles is critical to our future success.

Appropriate Process to Guide Program Evaluation or Change

I fully recognize that change, whether inferred or initiated, can create excitement as well as concern. Changes in organizational structure and leaders or in key missions (e.g., education, research or clinical care programs) will have both advocates and detractors. I believe that change is healthy for organizations and that periodic examination of areas of investment or concentration help assure that we sustain or even improve our excellence, both as individuals and as a School and University. My approach will be to continue to question what we are doing now and to ask whether there are better ways we might enlist for the future. My style is to engage faculty, students and staff in the discussions with the expectation that different views will be expressed and heard and that the steps we take will be as informed as possible. Naturally this does not mean that every change that is made will be affirmed by all involved. However, the process followed and the reasons for the conclusions or recommendations should be clear, direct and as transparent as possible. The process for change should be inclusive and those involved should communicate directly. These principles are likely self-evident but a recent set of events compels me to address whether they are embraced or shared by all members of our community. Because these events have challenged the integrity and value of our School, I want to share them with you and enlist your understanding and support.

The concerns I have relate to the work being carried out by a committee I recently asked to examine the School’s primary care clinical, education and research programs. This Committee was asked to examine the current programs in Family, General Internal and Community Medicine, and to determine whether we could build on current successes and even further improve medical student, resident and fellow education as well as clinical care and research. Dr. Peter Gregory, Senior Associate Dean for Clinical Affairs serves as Chair and is joined by Dr. Neil Gesundheit, Associate Dean for Medical Education, Dr Joe Hopkins, Co-Director of Family Medicine and Associate Chief Medical Officer, Stanford Hospital & Clinics, and Dr. Judy Swain, Chair of the Department of Medicine. The Committee is inviting input from various program leaders. Unfortunately, during this process, misleading and erroneous information has been communicated to the Society of Family Medicine, Office of the County Supervisor, Members of Congress, California Medical Registration Office and others, implying that the

School was terminating its programs and commitment to education in Family Medicine and primary care. This is untrue. Indeed, the goal has been to evaluate and strengthen the existing programs. One such approach is to combine the faculty and clinical leaders in family, general and community medicine into a new organizational structure that creates a greater critical mass and new synergies to improve clinical care, education and research.

Engaging constituencies outside of the School is, in my opinion, inappropriate when an internal process is fair, open and inclusive. Doing so also creates confusion among our public and private communities. That is especially the case when the information being transmitted reflects negatively on the School.

In an academic environment alternative views should be welcomed and expressed but they should come directly and not in a manner that circumvents or distorts a reasoned approach to evaluation, dialogue or change. We have a responsibility to be respectful to each other and to our School and University. During the months and years ahead we will want to engage in many discussions about change. We will want to debate these issues and examine various perspectives. We will want to be honest with each other and permit the choices we make to be informed and valued. We will not be successful if self-interest contaminates or confuses an appropriate process for examination and change. We should not engage or condone that kind of behavior.

Update on Hospital Issues

Physician Leadership Committee. I had previously announced the formation of a Physician Leadership Committee that has been charged to define and determine the role that physicians play as responsible leaders in the Hospitals and Clinics. Central to this is determining the authority and accountability that School of Medicine faculty physicians have in carrying out their responsibilities as institutional leaders at SHC and LPCH. The Committee and Subcommittee will focus initially on SHC exclusively. I am serving as the Chair of this Committee and am joined by Dr. Peter Gregory, Senior Associate Dean for Clinical Affairs as the co-chair. Three subcommittees have been formed with reports presented and discussed by the (Clinical) Faculty Leadership Group (FLG) which meetings early Thursday mornings. The Subcommittees include:

1. ***The Role of Faculty as Physician Leaders in SHC and LPCH.*** This subcommittee is chaired by Drs. Al Lane, Chair of Dermatology and Ron Pearl, Chair of Anesthesiology and will address the authority, responsibility and accountability of physicians' roles as department chairs, clinical service-line directors, clinical laboratory or program leaders. The work of this subcommittee should be completed by the middle of July
2. ***The Role of Physicians in Administrative Positions*** is chaired by Dr. Peter Gregory and is addressing the roles currently associated with the positions of Senior Associate Dean for Clinical Affairs, Chief Medical

Officer, Chief of Staff, President of the Medical Staff, etc. Dr. Gregory has presented recommendations to the FLG during its last two meetings and has received excellent feedback. The work of this subcommittee will be completed by mid-June.

3. **The Future Organization of Physicians at Stanford** is co-chaired by Drs. Mary Lake Polan, Chair of Gynecology & Obstetrics and Alan Schatzberg, Chair of Psychiatry and will address the potential value of forming a Physician's Organization (PO) or Physician-Hospital Organization (PHO). This subcommittee will also address whether the physician practice plan should be integrated with the Hospital or separated as a Faculty Practice Plan or Foundation model. This subcommittee will proceed more slowly, carrying out its review and discussions during the summer.

CEO Search. An Advisory Committee comprised of members of the Board of Directors and School leadership is working with Korn-Ferry, an executive search firm, to identify the next CEO of Stanford Hospital and Clinics, succeeding Ms. Malinda Mitchell who retired on May 31st. The CEO Advisory Committee, on which I serve, has begun interviewing potential candidates and during the next month will be inviting a selected group to return for more extensive interviews and discussions. This is obviously a most important search and is being carried forth with understandable confidentiality. However, it is fair to say that the Advisory Committee has been pleased and impressed with some of the potential candidates who have expressed interest in this important position. Details will follow.

Some Notable Events

Medical Staff Meeting. On Thursday evening, May 31st, I participated in the Medical Staff Meeting for Stanford Hospital & Clinics (SHC). Dr. Marty Bronk, the elected President of the Medical Staff, chaired the meeting. In my remarks to the Medical Staff I outlined the various initiatives the School of Medicine plans to pursue in education, research and clinical care during the years ahead. However, I also underscored that achieving some these initiatives is currently challenged by the fiscal problems facing SHC. Addressing these problems requires physician leadership, cooperation and unity regardless of whether one is a community-based practicing physician or a member of the clinical or basic science faculty. Unity, leadership and cooperation are needed throughout the Medical Center to address clinical service improvements, delivery and cost-effectiveness as well as our external relationships with payors and our communities, both public and private.

Annual ID Retreat and Dinner. The Department of Medicine's Division of Infectious Disease held its retreat on May 30-31 and invited me to participate in a discussion on the future of medical education at their annual dinner. The discussion was based, in part, on some the observations made by Dr. Kenneth Ludmerer in his important book entitled **Time to Heal: American Medical Education from the Turn of the Century to the Era of Managed Care** (published by Oxford University Press in 1999). I strongly

recommend reading this book which addresses the significant impact on medical education during the past decade because of the dramatically reduced time for clinical teaching and clinical care as a consequence of managed care and the medical market place. Without question, finding creative and novel solutions to the loss of time to interact with students or with patients is one of our most important challenges in medical education and care in this era.

E-Learning for Cardiovascular Medicine Trainees. When the new fellows begin their training in the Department of Medicine's fellowship program this July, they will benefit from a new computer-based learning module. Developed by Drs. Judy Swain, Professor and Chair of the Department of Medicine and Stan Rockson, Associate Professor of Medicine, in collaboration with Stanford University Media Solutions, this model program brings computer-based learning to postgraduate clinical programs following the important computer learning systems already available for medical students. I had the privilege of previewing portions of the cardiovascular medicine program and want to commend Drs. Swain and Rockson for their efforts.

Visit with the Department of Psychiatry. I want to thank Dr. Alan Schatzberg, Professor and Chair, for permitting me to attend the Department of Psychiatry's faculty meeting, providing me the opportunity to meet with faculty and learn more about the issues and concerns of specific departments. I have asked to attend faculty meetings in both basic and clinical science departments throughout the School during the months ahead as a way of getting to learn more about the issues facing our faculty and School. I plan to continue these meetings on a regular basis in the future.

Congratulations

Karen J. Guillemin, PhD, a postdoctoral scientist in Dr. Stan Falkow's laboratory in the Department of Microbiology and Immunology, has been named a recipient of the prestigious Burroughs Wellcome Fund Career Award in the Biomedical Sciences. Dr. Guilleman works on the genetic and cellular basis of *Helicobacter pylori*-associated malignancies and was one of 23 award recipients from an applicant pool of over 200 from the nation's most research-intensive universities. This is a wonderful achievement.

Appointments and Promotions

Karla Kirkegaard was approved by the University Advisory Board for promotion to Professor of Microbiology and Immunology, effective June 1, 2001.

Dean's Newsletter

June 25, 2001

Commencement Events

It was a true privilege to participate in the graduation festivities during Commencement Weekend at Stanford. Although my personal time measured only 10 weeks at the time of Commencement, it was still wonderful to be included in the celebration and to witness the happiness and satisfaction of our graduates, their families and our faculty. Without question, the joy of our graduate and medical students as they received their Stanford degrees shined brightly and proudly. The 2001 Medical School Convocation held on the Dean's Lawn on Sunday June 17th, included 18 recipients of the Master of Science Degree, 74 recipients of the Doctor of Philosophy Degree and 99 individuals receiving the degree of Doctor of Medicine. I am pleased that University Trustee Denise O'Leary joined us for our graduation ceremony.

This year's Medical School Commencement featured wonderful speeches by two Class representatives: Laura Evenson Furstenthal spoke on behalf of the Graduate Students and Mark Michael Pomerantz represented the graduating Medical Students.

I was very pleased that Dr. Gene Bauer agreed to deliver this year's Commencement Speech, the text of which follows below. Dr. Bauer has played an enormously important role at Stanford during his years as Dean (1995-2001). During that period many changes occurred at the Medical Center, including the merger and then de-merger of Stanford with UCSF. Although these events and their consequences have continued to impact the School and faculty, it must also be noted that Dr. Bauer was also instrumental in helping the School to grow and achieve even greater excellence during this very challenging period. Importantly, during his tenure as Dean, the School recruited a number of exceptional faculty, added a number of Endowed Professorships, increased the number of NIH and other competitive grants and awards, expanded its research space to include the Center for Clinical Sciences Research (CCSR), and continued to attract superb students, including many in this year's graduating class.

I also had the interesting experience of traveling to Boston on June 19th for the graduation of the residents in Pediatric Medicine at Children's Hospital/Harvard whom I had helped train prior to moving to Stanford this April. There I not only presented certificates to the graduating seniors, but also welcomed the new interns, including two individuals (Drs. Brian Feldman and Patricia Kao) to whom I had presented diplomas at Stanford's commencement on June 17, 2001!

The lovely graduation ceremony and the events that preceded and followed it were done superbly. However, they could not have been so successfully accomplished without the dedicated and hard work of a large number of very hard-working individuals. On behalf of the School, I want to offer my personal gratitude and appreciation to Char Hamada,

and Zera Murphy along with Susanne Bethard, Duane Campbell, Jacob Christian, Lucie Cunningham, Doug Monica, Sharon Olsen, Candace Romandia, Mandy Rowe, Cassandra Sooter, Jacquelyn Ziegler and Marjorie Weesner for helping to make the graduation events so successful. I also want to thank Dr. Neil Gesundheit for his help as well.

Medical School Convocation Address: “Observations on Opportunity: Diseases of Mice and Men” by Dr. Gene Bauer

While the title of my remarks today is perhaps too cute by half, I hope that my theme is not. My goal is immutably to link the unity of biomedical science and the immeasurable opportunities that have been placed in your hands — whether physician or fundamental scientist — to use the tools of your education for the benefit of humankind.

The graduates here today represent the continuum of the biomedical community, MD, MD-PhD, and PhD graduates. Your education and approach to problem-solving are embodied in the diseases of mice and men. Pasteur noted that "there does not exist a category ... to which one can give the name applied science. There are science and the applications of science, bound together as the fruit to the tree which bears it."

Never has there been a greater need, or a greater opportunity, for you to find ways to work together and to share your unique talents, techniques, and insights.

But will you seize those opportunities?

Opportunities are framed by ideas.

Whatever else may be true, it is unambiguous that our perceptions of opportunity are framed by our experiences and our ideas. For each of us is unique. Gail Tsukiyama wrote in *The Samurai's Garden*, "Even if you walk the same road a hundred times, you'll find something different each time." And the distinguished scientist, Albert Szent-Gyorgi, noted that the essence of discovery consists of seeing what everybody has seen but thinking what no one else has thought.

Conversely, ideas are created by opportunity.

If our perceptions of opportunity are framed by ideas, it is also likely that ideas are framed by opportunity. In 1658, a physician, Johann Jakob Wepfer, was perplexed by the cause of stroke, then called apoplexy. At the time, while the symptoms of stroke were well-known, its etiology was not. Yet Wepfer followed his intuition that the brain must be involved and seized an opportunity to perform careful postmortem examinations, forever after linking cerebral hemorrhage to the etiology of stroke.

In more recent times, say 1960, who would have predicted that we, 40 years later, would possess the template of the entire human genome as a basis for experimentation, let alone for therapeutics?

- Indeed, despite a deep-seated intuition about the unity of biology, who then would have predicted that the genome of a roundworm, or of a fruit fly, or of a zebra fish, would approximate the human genome and present models for human developmental processes and diseases?

- Or, even if you were one of the handful of prescient scientists who absolutely knew that men — perhaps especially men — at their cores, were worms or mice, would you have predicted the human genome to consist of only 30,000 genes, rather than the 100,000 genes predicted only a couple of years ago?

How are we to bring the powerful unity of science to bear on human illness?

It is tragic that the pressures of providing cost-effective health care demand that patients be discharged from hospitals so quickly that students and trainees have no opportunity to observe the natural history of disease.

- Shall we be forced ultimately to rely upon disease models?
- And, if so, are transgenic models (for example) faithful replicas of their putative human counterparts — even in a genetic sense, never mind how environmental factors may play out in non-human species (e.g., mice versus men)?
- Or, are computer simulations sufficient (even with three-dimensional imaging and haptic feedback) to train our students in the nuances of human biology?

In commenting on...teaching hospitals, Dr. Kenneth Ludmerer (in, *A Time To Heal*) observed, "The medical effects of...a dramatic reduction in the length of stay and of moving...procedures out of the hospital were controversial... [but] one consequence was clearly apparent: the erosive effects on the learning environment... It became...harder for learners to acquire problem-solving skills when patients were admitted with...diagnoses...and treatment plans already determined. Surgical residents, meeting patients under the drapes of the operating table, could still learn how to remove a gall bladder, but their opportunity to develop the clinical experience and judgmental capacity to decide who might actually need the procedure was severely compromised."

And so, I repeat: Shall we be forced to rely only on disease models (either biologic or virtual)?

I think not. To do so would be an egregious example of hubris, for Mother Nature presents us many forms and patterns, and eventually she would have her revenge.

Rather, we must bring the power of science to bear and seize unprecedented opportunities to collaborate at all levels — virtual models, biologic models, and authentic human beings for the best educational — and clinical — outcomes.

Opportunities are defined by actions.

Feldman and Spratt in their book, *Five Frogs on a Log*, used a child's riddle to make this point. It goes as follows.

Five frogs are sitting on a log.

Four decide to jump off.

How many are left?

Answer: 5

Why? Because deciding and doing are not the same things!

To make a difference you must seize opportunities.

I shall offer a brief example of how one person did seize an opportunity offered by proximity to excellent fundamental science to help transform a field in the space of 30 years. It is the story of a colleague who has been a friend to Stanford on many occasions.

Dr. Irwin Freedberg is now the George Miller McKee Professor and Chairman of the Department of Dermatology at New York University School of Medicine, arguably one of the most distinguished departments in the world. In 1967, as an assistant professor at Harvard Medical School, he assayed the state of dermatologic research in a paper entitled, "Rashes and Ribosomes," in the New England Journal of Medicine.

He concluded that dermatology had progressed from its descriptive phase of naming rashes to one in which the tools of genetics and biochemistry could be used to characterize the skin. At the time, the subunits of the epidermal protein, keratin, had not been isolated, but Freedberg predicted that important insights about keratin synthesis and function would emerge from an incipient revolution in molecular biology.

Dr. Freedberg revisited the state of the science in a recent lecture. In the 30-year interval, the field has been transformed, and it is no longer one populated exclusively by dermatologists.

For a moment, let me engage in a brief sidebar. As all of you graduates know, we academics are prone to preface any description of our own work by the phrase, "My, or our, laboratory and others..." In this case, the "and others" includes such eminent scientists as Elaine Fuchs of the University of Chicago and Matthew Scott of Stanford. Now back to my anecdote. Freedberg's laboratory, and others, proved that the keratin family consists of at least 30 distinct keratins, proteins found in all epithelial tissues, not just in the skin. His laboratory, and others, showed that the cytoskeleton is comprised of keratin intermediate filaments, structures that play a pivotal role in normal development and in several debilitating — potentially lethal — genetic diseases, including epidermolysis bullosa and ichthyosis. And his laboratory, and others, defined the regulatory elements responsible for expression of the various keratin proteins that combine uniquely in various tissues during developmental processes or in diseases.

I believe we can extract a philosophy from this anecdote, one that is applicable to basic scientists and physicians alike.

The philosophy is simple: Provide students with resources, including free access to one's own knowledge, and allow them to formulate the hypotheses and develop the experiments.

- In short, the philosophy is one of opportunity.
- The necessary ingredients include facilities — and instrumentation — and reagents — and, yes, even hospitals and clinics, so that Mother Nature's own examples, the patients, who suffer from debilitating illnesses, can be defined, cared for, and learned from.
- The expectation of the students is one of creativity and hard work.

The product of such a philosophy will be the launching of the careers of biomedical scientists and physician leaders of the future.

- That is what Stanford **is** about.
- That is what your education at Stanford **has been** about.
- I hope that is also what your future lives **will be** about.

Learning and creativity are, or should be, lifelong goals. And as Yogi Berra said, "You can observe a lot by watching."

In closing, let me return to the beginning.

I have cajoled, even admonished, you to recognize the unity of science and to seize opportunities to link diseases of mice and men to improve the human condition. But what is opportunity and how do we measure it?

The Ancients offered us some examples of its fleeting nature.

- There is the old *Proverb* that "Opportunity knocks only once."
- The Romans offered that "Once lost, Jupiter himself cannot bring back opportunity."
- And Hippocrates said, "Healing is a matter of time, but it is sometimes a matter of opportunity."

We Moderns have been less poetic, if equally pithy.

- To quote Woody Allen, "Eighty percent of success is showing up."

So, I beg you, since you now have all of the other tools, please show up!

Close

I extend my deep congratulations on your accomplishments, culminating with your graduation today, and with all of the other faculty members, I shall eagerly await news of your many future successes.

Awards and Honors at Graduation

In addition to honoring our students, commencement is also a time to recognize faculty who have made major contributions to student teaching and who serve as role models for our graduate and medical students. Following are the faculty who received awards at the 2001 Medical School Convocation. I should note that while each individual is to be praised for his/her accomplishments, two members of our faculty, Drs. Kelly Skeff and Samuel Le Baron, are singled out for receiving two teaching awards each! Please take a moment to congratulate this year's recipients.

The Kaiser Award For Excellence In Preclinical Teaching

Lisa N. Gervin, Medicine
 Eric Glasgow, Human Anatomy (posthumously)
 Phillip M. Harter, Surgery
 David B. Lewis, Pediatrics

The Kaiser Award For Excellence In Clinical Teaching

Samuel LeBaron, Family and Community Medicine
Ann N. C. Leung, Diagnostic Radiology
Lars Osterberg, Medicine

The Kasier Award For Outstanding And Innovative Contributions To Medical Education

Kelley Michael Skeff, General Internal Medicine

The Arthur L. Bloomfield Award For Excellence In Teaching Clinical Medicine

Samuel LeBaron, Family and Community Medicine
Lawrence H. Mathers, Pediatrics
Kelley Michael Skeff, General Internal Medicine

The Franklin G. Ebaugh Jr. Award For Advising Medical Students

Helena C. Kraemer, Psychiatry

The Alwin C. Rambar-James B.D. Mark Award For Excellence In Patient Care

Youn H. Kim, Dermatology

Stanford University School Of Medicine Award For Graduate Teaching

W. James Nelson, Molecular and Cellular Physiology

Stanford University School Of Medicine Award For Outstanding Service To Graduate Students

Howard Schulman, Neurobiology

Again, congratulations to each of our award winners and to the many other members of our faculty and resident staff who contribute so much to the education and training of our students and each other.

Affirmation of Support for the Medical Center by the Chairs of Basic Science Departments

On June 21st, the Chairs of the Basic Science Departments sent a letter affirming their support for the Medical Center to the leadership and trustees of Stanford University. This letter, signed by all ten chairs (Richard Aldrich

(Molecular & Cellular Physiology), Helen Blau (Molecular Pharmacology), John Boothroyd (Microbiology & Immunology), David Botstein (Genetics), Stephen Galli (Pathology), Mark Hlatky (Health Research & Policy), Eric Knudsen (Neurobiology), Michael Levitt (Structural Biology), Roeland Nusse (Developmental Biology) and Suzanne Pfeffer (Biochemistry).

In their letter, the Basic Science Chairs noted that “Our hospitals play an extremely important role in our ability to train medical and graduate students and postdoctoral fellows, and to link our basic research enterprise with efforts to improve our understanding of disease pathogenesis and to make advances in patient treatment and care....We believe that maintaining the University’s close connection with the hospitals is necessary for our continued success, and we appreciate the efforts you and President Hennessy are taking in support of the Stanford School of Medicine”.

I want to thank the Basic Science Chairs for their initiative in expressing their support and commitment to the School, Medical Center and to their Clinical Science Colleagues. As I have underscored in prior communications, the important challenges we face today can be overcome, especially when we work together. This vote of support and affirmation is important evidence of such unity and I am enormously appreciative for that vote of confidence.

Presentation to the Medical Center Committee of the University Board of Trustees

On Thursday, June 14th, I presented to the Medical Center Committee of University Board of Trustees on the current and future strategic goals and challenges facing the School of Medicine. This was an opportunity to review with the Trustees that our mission, as a leading research-intensive School of Medicine, is to improve the lives of adults and children through research and education. After reviewing how we are planning to enhance our missions through strategic initiatives in education, research, clinical care, advocacy, public policy and community service, I also underscored how affected we are by the financial forces impacting academic medical centers. In addition we have important needs for renewed facilities for education, library, research, information technology and clinical programs (most recently including the Cancer Center/Ambulatory Care Program). Achieving these critical needs will require considerable financial support for capital development, a major portion of which will need to come from philanthropic support. Accordingly, I underscored with the Board members our pledge to work within the School as a faculty to improve our financial management and accountability but also to work collaboratively with the Development Office to help raise new funds to support critical operational and capital programs and projects. Equally importantly, I emphasized the importance of the University leadership, including the Board, in doing everything possible to help the faculty and School achieve its key needs and objectives. This will also require the support of the Trustees and University leadership in assuring that the School’s needs are given sufficient priority for a capital campaign for “Stanford Medicine” to assure our future success.

Dr. Richard Aldrich is Named Chair of the Department of Molecular and Cellular Physiology

I am pleased to inform you that Dr. Richard Aldrich, Professor of Molecular and Cellular Physiology and Investigator at the Howard Hughes Medical Institute, has agreed to serve as Chair of the Department of Molecular and Cellular Physiology effective June 1, 2001. He succeeds Dr. W. James Nelson who stepped down as department chair in order to assume the responsibilities of Senior Associate Dean for Research, Graduate and Postdoctoral Education.

Dr. Aldrich arrived at Stanford as an Assistant Professor in 1985 and achieved tenure in 1990. In 1997, he was named Associate Chair of Molecular & Cellular Physiology. His scholarly work focuses on the molecular mechanisms of ion channel function and their role in electrical signaling. He is the recipient of numerous awards for his research and, in 2000, was elected a Fellow of the Biophysical Society. He is currently the president of the Society of General Physiologists.

Dr. Aldrich is both a valued colleague and an outstanding University citizen. I know that each of you joins me in extending best wishes to Dr. Aldrich as he undertakes this important assignment.

Academic Appointments and Promotions

The June Advisory Board approved the following actions:

Appointment of Joseph Belanoff to Assistant Professor of Psychiatry and Behavioral Sciences

Promotion of Francis Blankenberg to Associate Professor of Radiology, with tenure, effective July 1, 2001.

Congratulations to Drs. Belanoff and Blankenberg.

Dean's Newsletter July 9, 2001

Summer Schedule

Commencement has passed. Medical students who graduated two weeks ago have now begun their internships at Stanford or around the country. In addition, new interns and residents are beginning their training at Stanford Hospital and Clinics, Lucile Packard Children's Hospital and our affiliated programs. It is a time of transition in teaching hospitals and despite the "summer season" is a period that is hectic, frenetic and exciting. I want to extend a warm welcome to all who have joined our community in the past two weeks.

Summer is also the season for the final steps of the Medical School budget planning. The next 6-8 weeks will bring to closure the results of months of intense planning by Department Managers, Chairs and staff regarding their FY02 budgets. During the next weeks we will be meeting with each of the basic and clinical science department chairs to review their budget projections as well as their programmatic plans for this next fiscal year which begins on September 1, 2001.

In addition to the completion of the Medical School budgets, our two major hospitals, SHC and LPCH, are also completing their budget planning for FY02. An additional part of this process will be to address the various intersections of this budget between the School and the Hospitals.

Medical School Class Entering 2001

According to Dr. Gabriel Garcia, the work is nearly complete in identifying the members of the medical school class who will enroll in September 2001. This year the Admissions Committee reviewed over 6000 applications and currently has 86 students holding a position with Stanford. Dr. Garcia and the Committee are thrilled with the quality of the students who will be joining Stanford this Fall. Our new medical school class will include 16 students from Stanford. The remaining 70 students come from 40 other schools. The average age of this year's incoming student is 23 (range 20-32) and 16 students (19%) already have a graduate degree. Nine of the incoming students will join the MSTP program and pursue both an MD and PhD degree. Women comprise 55% of the class and 28% of the new students are underrepresented minorities.

Finding outstanding students from such a large pool of highly qualified applicants is an awesome and daunting responsibility. I want to thank Dr. Garcia and the members of the Admission's Committee for their outstanding work.

New Appointments in the Office of the Dean

Special Assistant to the Dean. I am very pleased to announce the appointment of Beverly A. Simmonds to the position of "Special Assistant to the Dean", effective Monday, July 9, 2001. In this role Beverly will be responsible for providing administrative management and programmatic assistance, managing the coordination and implementation of special projects, and acting in a liaison capacity for the Dean. It is my hope that with Beverly's special assistance we will be able to respond even more promptly to the many important issues which come to the School's attention. In addition, Beverly will staff our Executive Committee and Medical Center Trustee meetings.

Beverly has been the Director of Finance and Administration for the Department of Biochemistry since November of 1998, where she directed all administrative and financial functions within the Department. Prior to this position Beverly was the Manager for Research Administration in the Department of Medicine at

UCSF, where she managed operations for the Department's Research Services Unit, including oversight of all Departmental research funds and management of a 15-person research administration team. From 1989 to 1993, Beverly held a Project Director position at SCRDP, where she worked with investigators from Medicine, Psychiatry and Pediatrics on adolescent health promotion and disease prevention research projects.

I am confident that Beverly will make strong and meaningful contributions to the School in her new position. Please join me in welcoming Beverly to her new role in the Dean's Office. Beverly may be reached via phone at 724-7233, via fax at 725-7368, or via email at simmonds@stanford.edu.

New Standing Committees in Academic Affairs. Dr. David Stevenson, Senior Associate Dean for Academic Affairs has invited Dr. Mary Lake Polan, Professor and Chair of Obstetrics and Gynecology to serve as the Chair of the Standing Committee on Women in Medicine and Biomedical Research. I am extremely pleased that Dr. Polan has agreed to assume this responsibility and I look forward to sharing with you her goals and plans in the very near future.

In addition, Dr. Fernando Mendoza has agreed to serve as the Chair of the Standing Committee on Diversity. He and his colleagues are developing a proactive agenda to improve diversity, especially in our faculty, and I am happy to share his plans as they become further established.

Noted Pediatric Cardiovascular Surgeon to Join Stanford and the Lucile Packard Children's Hospital

On Thursday, July 5th, Dr. Frank Hanley, Professor of Surgery and Chief of Cardiothoracic Surgery at UCSF announced his decision to join the Stanford faculty and Lucile Packard Children's Hospital. Dr. Hanley is internationally recognized as among the very top tier of pediatric cardiac surgeons in the world. His coming to Stanford and LPCH will help launch the Heart Center, and a major component of the Children's Health Initiative. I believe that Dr. Hanley's recruitment will play a significant role in moving LPCH into the group of leading children's hospitals in the nation.

I want to thank Dr. Bruce Reitz, Professor and Chair of the Department of Cardiothoracic Surgery, for the important role that he played in the recruitment of Dr. Hanley. In addition to his role in the Department, Dr. Hanley will surely play an important leadership role at LPCH and I fully anticipate in the School of Medicine. I look forward to working with Dr. Hanley and offer him a very sincere welcome.

I also want to acknowledge the very fine job that Dr. Michael Black, Associate Professor, has done in caring for children with congenital heart disease during the past several years. I am very appreciative of his efforts and know that the leadership at LPCH and Stanford is most grateful as well.

Update on Hospital Issues

CEO Search. The Search Committee for the next CEO of Stanford Hospital and Clinics is working closely with Korn Ferry to identify the next incumbent of this incredibly important position. During the past 2-3 weeks, the Committee (which is comprised largely of members of the Board of Trustees, in addition to the VP of the Medical Center, Dean and a Department Chair) has reduced the "short list" of 6 candidates down to 2-3 lead individuals. The Committee hopes to present the final candidates to the President within the next weeks. We all hope that the next CEO can be named during the summer and begin her/his responsibilities in early Fall.

At the same time I want to acknowledge the impressive work that our interim CEO, Mr. Mike Peterson, is performing during this transition period. He has become an integral member of the team and we are all very pleased by his many excellent contributions.

Budgets. The Turnaround Committee continues meeting 2-3 times each week to address operational improvements for both Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. With the FY01 fiscal year drawing to a close, the dominant focus is completing the budget plans for FY02. Although considerable work remains, and intense efforts will be necessary to assure that the recommendations are followed with discipline and precision. I am very pleased to say that the financial forecasts are significantly improved from where they were just a couple of months ago. Many individuals have been working very hard throughout the Medical Center to make expense reductions or improve sources of revenue. Those efforts are paying off and we are most appreciative. However, the message is still clear — much remains to be done in order to sustain these financial improvements during the months and years ahead.

Clinical Initiatives Advisory Committee. Dr. Eugene Bauer is chairing a new committee to examine opportunities for new ventures between the School and the Hospital. The goal is to create new creative partnerships that will permit us to achieve new areas for success consistent with our missions in clinical care, research and education. Careful attention is of course being given to all legal and ethical guidelines. However, seeking improved financial performance is an important goal, especially during these very difficult and challenging times.

Shifting Public Opinion. It should not be missed that the last weeks have also given evidence of a rising tide of public opinion about the financial impact of managed care on both patients and institutions. The debate in the US Congress and passage of a "Patients' Bill of Rights" by the Senate represents an enormous step forward and a hopeful swing in public opinion. Certainly this is well reflected in the reports, editorials and op-ed pieces that have appeared in newspapers across the country. Next will be the debate in the House and engagement with the White House. Almost regardless of the immediate outcome it now seems clear that the elected officials, almost surely because of the input they are receiving from their constituents, are finally beginning to address the enormous inequities that have emerged as a consequence of managed care. While the final solutions are likely still years away, it seems likely that a shift toward a more rational health care policy and financing is now more visibly underway. Clearly we still have much work to

do to help inform the public and the important debate over health care reform and the enormously important role of academic medical centers.

Important Changes in Benefits for Faculty and Staff

Ms. Cori Bossenberry, Director, Human Resource Group, School of Medicine, shared proposed changes in the benefit plans for faculty and staff at the Dean's staff meeting on Thursday, July 5th. Because I felt these were important to share with our community now, I asked Ms. Bossenberry to summarize them for Newsletter readers. The following is her summary:

Child Care Grant Subsidy Program - A project of BenefitSU and the Stanford WorkLife Office:

The University will be sending information to faculty and staff between July 15 and July 31 regarding this new grant pilot program. Up to \$5,000 in tax free child care assistance grants will be provided to all eligible employees based on a need-based formula with defined income ceilings. The program applies to children who are less than 6 years old at the time of application. The program will be administered via the Dependent Care Spending Account. Applications must be submitted not later than AUGUST 15, 2001 to be considered for the grant - which will be effective January 1, 2002. Contact Anne Klug at 5-6293 or klug@stanford.edu for more information.

Adoption Assistance Program:

Pending final approval - if approved, effective September 1, 2001, employees will be eligible to receive \$5,000 in tax-free assistance to adopt a child (benefit is paid per child).

BenefitSU Announcements:

Open Enrollment Preview: November 1 through November 19th; Web and IVR (interactive voice response) enrollment; Benefits Fairs - November 5, 6, 7

Focus on Medical Plans: Employee contributions for most plans will increase. Stanford may not continue contracting with all HMOs. With SHC discontinuing most HMO contracts there is the likelihood of adding another PPO that continues to provide access to SHC - employees will have to pay more.

Retirement Contributions - MasterRecordkeeper - coming soon - one consolidated statement per month; partnership with Fidelity to provide single interface to participants with Vanguard and TIAA-CREFF.

Retirement Plan Changes:

Good news! Increase in tax-free sheltered savings limits over the next several years: employee maximum contribution increases to \$11,000 in 2002; caps at \$15,000; total maximum contribution (Stanford and employee) increases to \$40,000; employees over 50 can make "catch up" contributions.

Enhancements to Tuition Programs, effective 9/1/2001:

The STAP (Staff Training Assistance Program) maximum benefit will increase to \$1200 per year (from \$800) and will also be applicable to certificate programs. The STRP (Staff Tuition Reimbursement Program) maximum benefit will increase to \$5250 (from \$2,000) in tax-free tuition reimbursement.

Effective 1/1/02, graduate course work will also be reimbursable on a tax-free basis.

More information will be distributed to departments from the School's Human Resources Group along with standard communication from Stanford's Benefits Office.

Notable Events

Department of Surgery Faculty Meeting. On Monday June 25th I had the opportunity to meet with the Faculty in the Department of Surgery. I am currently in the midst of holding meetings with departmental faculty across the School in order to learn more about the issues facing both the clinical and basic science faculty. These meetings also provide an opportunity to meet individual faculty members. I plan to meet with departmental faculty, generally during one of their regularly scheduled sessions, throughout the year. Naturally, if there are pressing issues that arise at other times, please do not hesitate to contact my office or me directly.

Diversity Summer Pipeline Program. On Monday evening June 25th, during an uncommon summer rain, I had the pleasure of attending the Welcome BBQ for minority or disadvantaged students who are participating in the Stanford Careers Opportunity Program, the Stanford Program in Biological Sciences and the Stanford Early Matriculation Program. Although the weather was unwelcoming, the students were bright and excited about their participation in their programs and the opportunities that stood before them. I want to thank Drs. Ronald Garcia and Fernando Mendoza for inviting me to visit and speak with the students. It was wonderful to do so.

Bioethics Steering Committee. Also on June 25th I attended the Steering Committee meeting for the Center of Biomedical Ethics. Two notable presentations were given. The first, by Dr. LaVera Crawley, a Soros Faculty Scholar, reviewed her ethnographic as well as quantitative data regarding the role and education needs of African American Physicians in the end-of-life care of

their patients. Importantly, Dr. Crawley's studies are demonstrating the important need for end-of-life training and education that is culturally diverse and includes both the providers as well as patients and families.

In addition, Dr. Maren Monsen described some of the remarkable work she is doing by combining her skills as a filmmaker and physician. Her 1998 award winning documentary "The Vanishing Line" that chronicles a physician's exploration of how to meet the needs of dying patients with the right balance of technology, compassion and care. This remarkable film is used in medical schools, universities and hospitals around the country. Dr. Monson also described her current project entitled "Worlds Apart" which will explore the impact of culture on medical decision making.

One of the joys of being at Stanford is learning about the wide range of important studies and projects being carried out. I want to thank Drs. Crawley and Monsen for sharing their important studies with me.

Appointments and Promotions

I am pleased to announce that the Advisory Committee has approved the following appointments and reappointments.

Promotion of **Juliana Barr** to Associate Professor of Anesthesia at PAVAHCS, 6/1/01-5/31/06

Reappointment of **Karlene Cimprich** to Assistant Professor of Molecular Pharmacology, 7/1/01-1/31/05

Promotion of **James Lock** to Associate Professor of Psychiatry and Behavioral Sciences at LPCH, 9/1/01-8/31/06

Reappointment of **Carl Feinstein** to Professor of Psychiatry and Behavioral Sciences at SUMC, 9/1/01 for a continuing term

Promotion of **Sabine Kohler** to Associate Professor of Pathology and of Dermatology at SUMC, 6/1/01-5/31/06

Promotion of **Sherril Green** to Associate Professor of Comparative Medicine at SUMC, 9/1/01-8/31/06

Reappointment of **Randall Morris** to Professor of Cardiothoracic Surgery (Research) effective 9/1/01, for a continuing term

Congratulations to all.

Dean's Newsletter

July 23, 2001

Update on Bio-X and the Clark Center

During the past month, the ever-deepening construction site adjacent to the Dean's Lawn and across from the Fairchild Building gives evidence to the future location of the Clark Center. This building, scheduled to open in 2003, will house investigators from the Schools of Medicine, Engineering, and Humanities & Sciences. It will be a unique opportunity to further extend the interdisciplinary research model that has been evolving at Stanford for some years, and which has been codified under the banner of Bio-X.

The focus of research in the Clark Center is likely to follow several themes (e.g., tissue engineering, biodesign, biocomputation, molecular imaging) in an environment that has been physically designed to foster interaction and collaboration, both within its walls and extending outward throughout the campus. Indeed, the Clark Center and Bio-X are experiments in their own right and will shed insight on how these unique interdisciplinary models will work and evolve.

To help guide the role of the School of Medicine in both the Clark Center and Bio-X, I have appointed an Advisory Committee that is meeting during the summer to address the opportunities as well as challenges relating to this exciting new venture. Importantly, the fundamental underpinning of our work is to do everything possible to assure that the Clark Center and Bio-X meet every expectation of success and that the participants of the School of Medicine help enhance the new partnerships that will emerge from this unique collaborative model unfolding. The Advisory Committee will present its recommendations to the Clark Center/Bio-X leadership on an ongoing basis. In addition, we are planning to have a presentation regarding the Clark Center/Bio-X to the Medical School Executive Committee in the Fall. I will provide a more detailed update in the Dean's Newsletter following those presentations.

More about Benefits

Since posting the highlights of the upcoming benefits changes in my newsletter, we have been advised by the Benefits Office that faculty and staff interested in the Child Care Subsidy Grant pilot program should contact the Work Life Office at 723-2660; or their web site: <http://www.stanford.edu/dept/ocr/worklife> rather than contacting the Benefits Office. Please note that Post Docs are not eligible for this program.

Also, we were informed that some of the other benefits programs have not yet been finalized. However, the Benefits Office will provide communication about each of these new or revised programs prior to the November 1, 2001 benefits open enrollment period.

New Senior Associate Dean for Clinical Affairs is Appointed

As you likely know, Dr. Peter Gregory will be stepping down from his positions as Senior Associate Dean for Clinical Affairs and Chief Medical Officer at SHC at the end of August. For more than a decade Dr. Gregory has played a critical leadership role and has served as a valued colleague and collaborator for the School and the Hospitals. In doing so he has won the respect and admiration of senior hospital administrators as well as faculty leaders. Although my personal acquaintance with Dr. Gregory has been limited to the past three months, I can understand why he has been so admired. He is enormously knowledgeable, diligent, collegial and collaborative. He is a problem solver and his contributions to the clinical programs and faculty, especially during these periods of dramatic change in health care, have been significant and enduring. We owe him a tremendous debt of gratitude and respect and I want to thank him for all the help he has provided to the School and Medical Center. Dr. Gregory has been a terrific advisor and colleague.

In anticipation of his retirement, Drs. Gregory, Bauer and I have given considerable thought to his succession and to the roles that individuals will play. Based on a careful examination of Dr. Gregory's current responsibilities, and a review and discussion with our Clinical Department Chairs (see report in June 11th Dean's Newsletter), we have decided to eliminate the role of the Chief Medical Officer. By doing so, we plan to distribute the related responsibilities to the Senior Associate Dean for Clinical Affairs and the Chief of Staff at SHC (currently Dr. Larry Shuer).

Anticipating Dr. Gregory's planned retirement, I have also spent considerable time and effort during the past several months in seeking the best individual to succeed Dr. Gregory as our next Senior Associate Dean for Clinical Affairs. I am very pleased to announce that Dr. Norm Rizk has agreed to accept this important position. As with our other Senior Associate Deans, Dr. Rizk will carry out his Decanal responsibilities part time (approximately 50%) so that he can continue to remain the Director of the Intensive Care Unit and serve as an ICU attending and pulmonary medicine consultant. I am very pleased that Dr. Rizk will carry out the clinical functions since I am certain they will enable him to be even more effective as the Senior Dean for Clinical Affairs. Dr. Rizk is currently Professor of Medicine (Pulmonary and Critical Care Medicine) at the Stanford University Medical Center. I have admired his intellect and leadership on a number of hospital and school-wide issues during the past three months and have every confidence that he will do a superlative job as Senior Associate Dean for Clinical Affairs.

Again, I am deeply appreciative for the many contributions that Dr. Peter Gregory has provided and continues to offer. I am also enormously pleased that Dr. Rizk will be assuming this very important role and I look forward to working with him in the years ahead.

Proposal for a Vision Center and an Important Partnership

At the Medical School's Executive Committee meeting on Friday, July 6th, Dr. Mark Blumenkranz, Professor and Chair of the Department of Ophthalmology, presented a proposal for the creation of a Vision Center. This Center would house the clinical, education and research programs of his department and which would be based at the VA Hospital. Dr. Blumenkranz has been working on a conceptual design for this proposal for

nearly a year and has won the support of the VA leadership to pursue more serious discussions. The opportunity to improve the diagnosis, care and treatment of eye disorders, to improve collaborations and important interactions with the VA Hospital, and to provide greater resources for research and education, was viewed with considerable enthusiasm by the Medical School Leadership. My own discussions with the leadership at the Palo Alto VA Hospital affirm that the Vision Center proposal offers an opportunity for a special partnership between Stanford and the VA.

As evidence of the School's support for the Vision Center proposal, the Executive Committee voted unanimously at its July 20th meeting in favor of Dr. Blumenkranz's proposal. He will proceed to further discussions with the VA leadership. I will keep you informed of the further developments in this important project as they unfold.

Thanks to the President and Trustees for the Thank You

On Friday, July 20th, we had the pleasure of having President John Hennessy, University and Hospital Trustees Isaac Stein, Denise O'Leary, and John Freidenrich along with VP for Development John Ford, attend our Executive Committee meeting. The President and Trustees wanted to thank the basic and clinical science chairs for the tremendous work they have been doing on behalf of the School and the Hospitals. President Hennessy and the Trustees indicated their continued commitment to the Hospitals during these very difficult times in academic medicine. They acknowledged the significant and tangible ways that the Chairs had demonstrated their support and how these efforts were helping the Medical Center to initiate important clinical and capital needs and opportunities.

Importantly, President Hennessy, Mr. Ford and the Trustees also affirmed their support for the important fundraising efforts that the Medical School and Medical Center wish to initiate in the months and years ahead. Recognizing that the University has a number of priorities, Mr. Ford acknowledged that the needs of the Medical Center were enormously important and that he understood them well having begun his own career at the Medical School.

Our next steps will be defining the components of the Stanford Medicine campaign that we will seek to initiate in the months ahead. To help with that, we are beginning to put together the foundations for a Trust Board comprised of volunteers who will work closely with the School, Medical Center Development Office and University. I am very pleased that Dr. Paul Berg, Robert W. and Vivian K. Cahill Professor of Cancer Research, Emeritus will play a lead role in interfacing between the School, Medical Center and Development Office on this important issue. I expect to be able to give you a more comprehensive update about our plans in the early Fall.

Good News from the LCME

You may recall that the Liaison Committee on Medical Education (LCME) had put Stanford University School of Medicine on notice in 1999 because it had neglected to renew its education and library facilities. I became intimately connected to this matter shortly after I accepted the offer to come to Stanford in December, 2000 because of the evolving plans regarding the GALE project. The latter was a \$185 million dollar project designed largely to renovate education, library, research laboratories, administrative

space and infrastructure support in the Grant, Always, Lane and Edwards Buildings. Unfortunately, the financial and physical constraints on this project, which was due to commence this summer, meant that no single component was fully satisfactory. Accordingly, following considerable review and discussion with Medical School leaders, faculty, students and others, I recommended that the GALE project be terminated. This was done in February, before my actual arrival in April. However, unresolved was whether the recommendation to cancel this project in favor of a more focused and prioritized effort to renew education and library facilities, depended on the favorable review and decision of the LCME. To address this question, Mike Hindery, Senior Associate Dean for Administration and Finance, I went to Washington in early March to make our case to the leadership of the LCME for an extension. That was followed up by a written proposal in April.

Thankfully, we received official notification last week that the LCME had favorably reviewed our petition to cancel the GALE project. This will permit us to now plan for education and library facilities that will provide a learning and information resource center to prepare our medical and graduate students for the important roles they will play in medicine and science in the 21st Century. In the next weeks we will be announcing our Planning Committees and will assure that the process engages students, faculty and the medical school leadership.

Visit to Santa Clara Valley Medical Center (SCVMC)

On Tuesday, July 17th, Dr. Peter Gregory and I visited with the medical and administrative leadership at the Santa Clara Valley Medical Center. We met with Dr. David Kerns, Chief Medical Officer, as well as with the Chairs of Medicine, Surgery, Pediatrics and Obstetrics/Gynecology. We also met with the Ms. Susan Murphy, Director of the Medical Center, Mr. Robert Sillen, Executive Director of SCVHHS, Mr. Robin Roche, Director of Ambulatory and Community Services and Dr. Kent Imai, President of the Medical Staff. I was extremely pleased and impressed with our visit.

SCVMC, an affiliate of Stanford University School of Medicine, provides wonderful medical care to the community and has been successful in securing impressive physical facilities which communicate a commitment to provide medical care with dignity, comfort and state-of-the-art medicine. In addition to the medical care provided, SCVMC plays an enormously important role in the education of Stanford students, residents and fellows. In reviewing the course evaluation by students, it is clear that the physicians and faculty at SCVMC are doing a superb job as clinician-teachers. We owe them our respect and gratitude for a job every well done.

I will look forward to future visits and discussions with our colleagues at SCVMC.

Update on Hospital Issues

Comments to the SHC Management Meeting on the Medical School and Physician Leadership: On Thursday, July 19th, I had the opportunity to address the Management Committee at Stanford Hospital and Clinics. I had been asked to offer my views about the future of the Medical Center. I thanked the Management Committee for their diligent work and considerable efforts during these past very challenging years of the merger, de-

merger and now financial recovery of Stanford Hospital and Clinics. I also pointed out how important and essential that I and the leadership of the School of Medicine believe that SCH and the Lucile Packard Children's Hospital (LPCH) are to the future of the School. Indeed, I pointed out that the Basic and Clinical Science Chairs had expressed that view in writing to the President and Trustees of the University. In addition, the Chairs are committing professional efforts and resources to assist the Hospitals achieve their programmatic, operational and capital objectives. In short, the commitment of the School of Medicine and the University to sustaining its close association with SHC and LPCH is unwavering.

I also pointed out that it was essential, in my opinion, that physician leadership be defined, embraced and engaged more fully at SHC and LPCH. Physician leaders, such as clinical chairs, service line directors, program directors (e.g., ICU) need to have roles that include authority, responsibility and accountability. In these roles they must work together with the Hospital administration as true partners and collaborators to achieve clinical and programmatic goals. I reaffirmed that I have been meeting regularly with the Clinical Chairs through a Physician Leadership Committee (see reviews in prior Newsletters) to help formalize the manner in which physician leaders will work in joint partnership with the Hospital to enhance patient care and service and to realize improvements in operational and financial arenas. Indeed, I underscored that, in my opinion, enhanced physician leadership and accountability is essential if SHC and LPCH are to achieve their objectives successfully.

More Work to Do on the SHC Budget for FY02. In previous Newsletters I have also commented on the efforts underway to improve the financial performance of both SCH and LPCH for FY01 (ending August 31st) and FY02 (beginning September 1st). It is important to note that very significant progress has been made to date and that this has required tremendous efforts by the Hospital Administration as well as faculty and staff. On July 18th, the budget proposals for SHC and LPCH were reviewed by the Finance Committee of the Hospital Board; while appreciating the progress made, the Board advised Hospital leadership at SHC to continue to work on expense reductions prior to the presentation of the final budget at the Board meeting scheduled for August 3, 2001. Although leadership at LPCH also anticipates further expense reduction, the budget proposal from Packard Children's Hospital was approved by the Finance Committee for submission to the August Board meeting.

Visits with Faculty and Departments

I have continued my visits to departmental faculty meetings and have very much appreciated the opportunity to meet faculty and learn about their goals and concerns in relation to the School, Hospitals and University. Since the past Newsletter I have visited with the Departments of Biochemistry, Ophthalmology and Obstetrics/Gynecology. I also visited with the Division of Cardiovascular Medicine in the Department of Medicine. I want to express my appreciation to the Department Chairs and their faculty for their candor, suggestions and hospitality. I will be continuing these visits with other departments in the weeks ahead and plan to continue them annually in the years ahead.

Student Lunches and Teaching

Soon after my arrival in April, I have been making teaching rounds on Thursday mornings with Dr. Harvey Cohen, Professor and Chair of Pediatrics, for students on their core rotation. It has been terrific and has allowed me to interact with both students and residents.

On July 12th, I began the first of weekly lunch meetings with medical and graduate students. Each week I am inviting about 12 students, from different years and programs, to join me for an informal exchange of ideas and topics. My goals are simple: to get to meet our students and to better understand their interests, concerns and experiences. We have had two sessions so far, each different from the other, but both highly enjoyable (at least to me). I will be continuing these sessions each Thursday.

Cautionary Notes

During the past weeks at least two issues have reached national and international prominence and deserve the attention of our faculty and students. Another issue requires the attention of selected faculty.

Stem Cells: The lay press and scientific journals have been filled with issues and concerns regarding embryonic stem cells. It is unfortunate indeed that the funding for this research has become so highly politicized. Indeed, it has led to a recent official comment regarding the use of NIH funds and this requires your awareness and attention. While our review does not demonstrate current involvement on the part of Stanford faculty in conducting such research, it is important to be aware of the current restrictions, even if one disagrees with them. The latest advice we have received is the following: Investigators are reminded that they may not use NIH direct, indirect, or construction funds for the derivation of human pluripotent cells from human embryos. That is, an investigator may derive human pluripotent stem cells from embryos in a university laboratory only if no NIH funds are used in support of the laboratory, its equipment, personnel working on the project, and/or building infrastructure costs usually charged to costs. In order to meet this requirement, universities seeking to derive human pluripotent stem cells from human embryos may have to establish separate research facilities for such work.

In sum, the work described above cannot be done on the Stanford campus at this time. Clearly this prohibition is being actively contested by researchers and leaders throughout the country, including several prominent Stanford faculty.

Clinical Research. The report this week that the Office for Human Research Protection has suspended almost all of the federally funded medical research involving human subjects at Johns Hopkins is a serious reminder of the need to maintain the strictest scrutiny and care in carrying out patient-related clinical care. Faculty and students are reminded that any deviations from approved practice can compromise an entire university and medical center, as evidenced by the actions at Johns Hopkins. Please be very attentive to these matters.

Conflict of Interest. Based on a recent survey, some 40 faculty have yet to submit their annual disclosure on conflict of interest. Those faculty who have not yet done so have received a number of warnings and on July 20th, their respective Department Chairs were

notified of faculty whose disclosure was not completed. Please know that if these forms are not completed by August 1, 2001, research privileges will be revoked for these individuals. If you have not completed your disclosure, please do so immediately.

Congratulations

I am pleased to announce that Suzanne Pfeffer, Professor and Chair of the Department of Biochemistry has been elected the president-elect of the American Society of Cell Biology. This is a wonderful accomplishment. Congratulations to Dr. Pfeffer.

I am also pleased to announce that Dr. Helen Blau, Professor and Chair of the Department of Molecular Pharmacology, has been named a recipient of the McKnight Endowment Fund for Neuroscience Award. Congratulations to Dr. Blau.

Dean's Newsletter August 6, 2001

Medical Technology Leadership Forum

Thanks to the leadership of Paul Yock, Martha Meier Weiland Professor of Medicine and, by Courtesy of Mechanical Engineering, and Mildred Cho, Senior Research Scholar in the Center for Biomedical Ethics, a forum on conflict of interest related to medical technologies was held at Stanford on Sunday, July 22nd and Monday July 23rd. Leaders from academia, industry, government, ethics and law from around the nation assembled to review the perceptions and realities of the "Risk and Reward in Medical Technology Innovation: Conflict of Interest at the Academic/Industry Interface". This Summit was sponsored by the Medical Technology Leadership Forum (MTLF), a not-for-profit membership organization dedicated to educating its own members, policy makers, the public, and the media about the critical issues affecting or arising from the development and adoption of advanced medical technology. The President of the MTLF is Hon. David Durenberger, who also participated in the Summit. Stanford President Emeritus Donald Kennedy, the Bing Professor of Environmental Science, served as the Chair of the Summit.

Although there is increasing clarity regarding the conflict of interest regulations with regard to clinical trials involving drugs and biological agents, there is less clarity around the role or participation of the inventor of a new medical device (e.g., a new stent) in the initial patient studies. This is the case when the inventor is also the most experienced and best individual to carry out the initial procedures (e.g., surgeon) to determine the feasibility of using the new device or technology. The perceived or real conflict arises when the inventor-surgeon also happens to be a faculty member as well as equity holder of the company that may ultimately market the new device. A governing principle is that research must be performed in a manner in which the conduct, management and oversight are not biased by potential financial gain to the investigator or the institutions. The MTLF

considered this scenario and others related to emerging medical technologies and will formulate a report that will be prepared by the MTLF and available from its Washington Office (1001 Pennsylvania Avenue, NW, Suite 850 North, Washington, DC 20004). Given the recent events at Johns Hopkins and the overall concerns around clinical research as well as conflict of interest, this Summit was timely and its final report is likely to be quite relevant.

Internal Governing Council Update on “Funds Flow”

In the May 29th Dean’s Newsletter (available on the Medical Center Home Page: <http://deansnewsletter.stanford.edu>) I reviewed the funds flow that occurs between the School of Medicine, the University, the Hospitals and Faculty Practice. An area of debate at Stanford as well as every other academic medical center in the nation concerns the funds that flow from the Hospitals to the School or clinical faculty. These have generally been referred to as “strategic support” or AS&T (administration, supervision and teaching). They include support for the role that clinical faculty play as directors of various services that are otherwise un-reimbursed, for the essential services to the Hospital or for new program development. I prefer to refer to these funds as payments for services rendered.

However, in the setting of decreased hospital revenue and negative bottom lines, the approach followed by academic medical centers around the country has been to challenge or reduce these payments from the Hospital to the clinical departments and faculty. This has happened at Stanford during the past year, placing an increased financial burden on the School and Clinical Department Chairs to accommodate the shortfalls, which have in some instances been quite significant. This challenge is made worse when the guidelines and rationale for the flow of these funds has been altered by years of special arrangements (a.k.a. “deals”) that advantage one department but may compromise others. Recognizing that these are issues that could challenge the financial and working relationship between clinical leaders, the School and the Hospitals, an effort has been underway during the past four months to address the principles governing funds flows from the Hospital to the School. Notably, this is not the first time there have been attempts to address this issue. The current goal has been to develop principles that are clear and fair, that are agreed to by the School, Clinical Department Chairs and the Hospitals, and that are transparent. Accordingly, during the past months several subcommittees comprised of Hospital and Medical School leaders have been working to develop the guidelines that will be used to support medical direction, essential and nonessential clinical services, program development and new ventures. Ultimately these funds would be “zero-based”. However, for the present they would be based on the historical aggregate (which has been reduced by over 20% in FY01), but redistributed using these new guidelines.

Dr. Norm Rizk, Professor of Medicine and soon to be Senior Associate Dean for Clinical Affairs, has led this effort. Dr. Rizk reported the updates from the subcommittees at the July 27th Internal Governing Council. While the initial expectation is that the new distribution of these funds will not occur in FY02, the Clinical Chairs have since agreed

to use the new definitions for FY02. That means that even though Departmental budgets are nearly complete and have factored in the distribution of these funds based on prior guidelines (and deals) they will now be redistributed based on the new definitions. The practical implication of this should not go without notice since the funds available to some departments will increase while they will decrease to others. Obviously this has a number of consequences but I applaud the willingness of the Clinical Chairs in moving forward with the new principles in order to make the overall funds flow process fairer, clearer and more transparent. We should know within the next couple of weeks how the redistribution will be allocated.

In the interim, I thought it would be helpful to remind all faculty and staff about the guiding principles for fund transfers from the Hospitals to the School of Medicine (specifically Clinical Departments) that has helped shape this important effort.

1. Fund transfers should represent payments for services rendered by the faculty to the Hospital or incentive payments from the Hospital to the faculty for services the Hospital wants to encourage and develop.
2. Payments made for specific services should be contingent on task and performance standards mutually understood by the faculty and the Hospital and should be reviewed annually by the standing committees that report to the Executive Funds Flow Committee.
3. Fund transfers should resemble ordinary business practices in other faculty and community practices and be transparent throughout the clinical enterprise.
4. Program development initiatives should be regarded as investment opportunities, with specific standards, risks and rewards for failure or success in meeting the standards. They should be subject to a maximal 3-year term, after which time they should expire, (unless specifically agreed in advance that continued support is needed for an essential service).
5. Ongoing program support should be restricted to specific services that meet productivity standards, are sized appropriately, and are deemed to be essential to the Hospital or School; other forms of program support should be withdrawn and be replaced by incentive payments for those services felt to be strategically or financially important.
6. Incentive payments should be based on overall financial health of the enterprise.
7. Some fraction of the profits from ancillary laboratory services should be returned to departments that direct and interpret the laboratory results, based on similar customs in the community and other academic medical centers. Fractions of the profits may also be apportioned to a pool within the practice, and/or to the Hospital. This should be individualized by the Executive Funds

Flow Committee and reflect the normal business practices in comparable practice settings.

8. New medical ventures should be encouraged but governed by a standing committee that describes boundary conditions for their development to avoid transfer of patient care outside of the hospital. The guidelines for the new medical ventures are being developed by a separate committee and will be presented in a subsequent report.
9. Implementation of this reorganization will require standing committees on medical direction, program development/incentives, essential services, and ancillary laboratories/medical ventures. These committees will report to the Executive Funds Flow Committee comprised of the VP, Dean, Hospital CEOs, CFOs, Senior Associate Dean for Finance & Administration and Senior Associate Dean(s) for Clinical Affairs.

Although the immediate management of the changes in funds flow from the Hospitals to the School of Medicine will be led by the Clinical Chairs, the results of this process will impact a number of faculty either directly or indirectly. Thus it is important to be conversant in these changes and to have them discussed within Clinical Departments and Divisions.

Senior Faculty Luncheon

On Monday July 30th I had the privilege to speak at the “Senior Faculty Luncheon”. This title only partially reflects the attendees and audience, where I was asked to address the role of Stanford in transforming American Medicine in the 21st Century. Indeed, this audience included not only the leaders of Stanford Medical School but the basic and clinical faculty who have literally transformed science and medicine during the past several decades. Addressing such an audience was both daunting and awe-inspiring.

My message at the beginning and end of my formal remarks was the hope that these leaders would help the School by being advocates for change and reaffirmation of our mission within the School and University to improve the lives of children and adults through education and research. I highlighted the remarkable incongruity of the exceptional scientific opportunities that stand before us and how they are challenged by the financial and clinical landscape impacting academic medical centers throughout the country and at Stanford specifically.

I pointed out how these challenges require making choices. This includes choices in the nature and scope of our educational programs, in the focus and size of our investments in research, and in the scope and depth of the clinical programs that are provided. Accordingly, it will be necessary to carry out a comprehensive review and renewal of our programs in the medical education curriculum. In doing so, our overriding goal should address educating future thought leaders by focusing on the development of physician-scientists and leaders in academic medicine and biomedical research, as well as related

leadership opportunities in the public and private sectors. We need to have creative pathways for interdisciplinary education and individualized career development, including, for example, opportunities in: Basic and clinical sciences, bioengineering, computer sciences, biocomputation, informatics; Public Health/International Affairs; Advocacy/Public Policy/Government; Education; Law; Arts and Social Sciences; Religion and Ethics; Business/Health Care Financing.

Stanford is special in that we admit an equal number of graduate students as medical students. Indeed, approximately 20% of the incoming medical class have an advanced degree and others pursue joint degree training programs. Thus, we must do everything possible to sustain and enhance the most outstanding Medical School-based Graduate Education Program which attracts the best students and that prepares them for success as leaders in academia or the public and/or private sector. In doing so, we should create opportunities for graduate students to be acquainted with the principles and practice of clinical medicine in order to foster an understanding and interest in translational clinical research. This should be increasingly feasible with the computer based virtual learning programs being pioneered at Stanford as well as with the use of various clinical simulation models.

We also need to move away from the compartmentalized learning that characterizes current medical education and seek to develop more of a continuum for training physician-scientists that extends throughout medical school, graduate medical education and fellowship training. Such a program might be anchored in the M.D./Ph.D. curriculum – this also being a program pathway we should seek to expand. As noted, each of these will require new funding sources, which will mandate that we convey a clear and understandable message about why these investments are necessary to secure the health and well being of future generations.

In addition to our mission in education, research excellence at Stanford is best secured by continuing to develop and enhance excellence in basic and clinical investigation in conjunction with seeking ways to foster interdisciplinary research efforts that are either programmatic or represent areas of opportunity. Wherever possible, there should be an alignment of basic and clinical research opportunities with the "centers of excellence" areas being developed through the Child Health Initiative and Stanford Hospital strategic initiatives.

Choices are also necessary in our clinical programs, focusing on those we can do uniquely and well, and in a manner that complements those services offered by other providers in our community. At this juncture, the primary areas of focus for both the adult and pediatric clinical programs that seem best pursued are in cardiovascular diseases, cancer, brain and behavior and surgical specialties. Again, wherever possible, these clinical centers of excellence will be enhanced by basic and clinical research agendas. Naturally this means that some other important areas of medicine will be de-emphasized at Stanford, largely because they can be offered by other providers or because they are not as prime for new development and innovation. This also means that we will need to work closely with our colleagues at the VA Hospital, Santa Clara Valley

Medical Center and with other community partners to develop an integrated and more embracing academic medical center.

During this period of transition, however, one thing is clear. We must sustain the integrity and relationships among our Hospitals & Clinics, our School of Medicine and our University. Not doing so will threaten the very relationship of our missions in clinical care, education and research. Needless to say, this will require sacrifice and commitment by all. It will require rigorous management of hospital and school operations and resources. It will require accommodation to reductions in services that have been previously valued. It will require even more careful investments in program development, recruitment and capital expansion. It will require us to think rigorously about every decision that requires school or hospital resources and to do so with a Medical Center perspective, as well as that of a student, investigator, clinician or staff member.

I also pointed out how pleased I am that both our clinical and basic science faculty leaders have pledged their support to work on behalf of the Medical Center through this difficult period. I underscored how equally pleased I am that our University leadership and Board of Trustees remain supportive. We have no choice but to work together to assure that future generations will benefit from the success of Stanford University School of Medicine and Medical Center.

Although our challenges are significant, they are achievable if we stay true to our principles and focused on our missions. We need to regain the public trust and their value of academic medicine, physicians and the future of health care. I asked each of the leaders present to help secure Stanford's future by being advocates for our continued excellence and for the choices we will need to make to secure an outstanding future as the role model of a research intensive School of Medicine for the 21st Century.

Some Notable Events

Departmental Faculty Meetings: Since the last Newsletter, I have had the pleasure of attending faculty meetings with the Departments of Dermatology, Comparative Medicine, and Urology. These meetings permitted discussions about issues relevant to different groups although some common themes understandably emerge (e.g., financial support, space, program development, physician leadership). I want to thank the respective Department Chairs for inviting me and the faculty for attending.

Visit to Cowell Student Health Center. On Tuesday July 24th, Dr. Peter Gregory and I had the opportunity to visit with Dr. Ira Friedman and his colleagues and staff at Cowell Student Health. Cowell provides care for 7,500 students and sustains a close working relationship with the Medical Center and faculty. We had the opportunity to discuss the programs currently conducted and to preview the plans for the new Center that is currently under construction. I want to thank Dr. Friedman and his staff for the excellent work they perform and for sharing information about their program with Dr. Gregory and me.

Update on the Johnson Center. On Tuesday July 31st, I had the opportunity to be updated on the work of the Johnson Center. Led by Drs. David Stevenson, Harold K. Faber Professor, and Maurice Druzin, Charles B. and Ann L. Johnson Professor, the Johnson Center represents a joint effort between the Lucile Packard Children's Hospital, SHC and the Departments of Pediatrics, Obstetrics and Anesthesiology. The Johnson Center includes the perinatal, neonatal and obstetric services at LPCH as well as neonatal and perinatal satellites at Washington Hospital in Fremont, Dominican Hospital in Santa Cruz, Salinas Hospital in San Jose, El Camino Hospital in Mountain View, ValleyCare Medical Center in Pleasanton, St. Louise Hospital in Gilroy and Sequoia Hospital in Redwood City. The Johnson Center is an outstanding model of integrated neonatal and perinatal services that represents an important resource to Stanford and LPCH and value to the community.

Congratulations

I am pleased to announce that Dr. Christopher Garcia, Assistant Professor of Microbiology and Immunology and of Structural Biology, has been named a 2001 Pew Scholar. Dr. Garcia represents one of only 20 Scholars nation-wide this year to receive this competitive award. Congratulations to Dr. Garcia.

Appointments and Promotions.

1. **Jan Matthijs van de Rijn** has been promoted to Associate Professor of Pathology at SUMC, effective 7/1/01-6/30/06.
2. **Alex Macario** has been promoted to Associate Professor of Anesthesia and, by courtesy, HRP, at SUMC, effective 7/1/01-6/30/06.

Congratulations to Drs. van de Rijn and Macario.

Dean's Newsletter August 20, 2001

Appointment of Senior Associate Dean for Medical Education

I am extremely pleased to announce that Dr. Julie Parsonnet has agreed to serve as our new Senior Associate Dean for Medical Student Education. She will officially begin her new responsibilities in October 2001.

Dr. Parsonnet is currently the Chief of the Division of Infectious Diseases in the Department of Medicine and an Associate Professor of Medicine. She has won international praise for her research on the role of *Helicobacter pylori* and gastric cancer. Dr. Parsonnet is also an outstanding clinician and wonderful Division Chief who has won the admiration and respect of her colleagues, fellows and students. Importantly she is an outstanding teacher and is enormously committed to the future of medical student

education. I am confident that her leadership and combined with her collaborations with the Faculty Senate, our faculty and students, will allow Stanford to excel even further as an institution committed to training tomorrow's thought leaders and physician-scientists. Dr. Parsonnet understands the scientific underpinnings of modern medicine as well as the art of care for human suffering.

Prior to joining the Stanford faculty in 1989 Dr. Parsonnet was a resident and then ID Fellow at the Massachusetts General Hospital as well as an EIS (Epidemic Intelligence Service) Officer at the Centers for Disease Control. She did her undergraduate at Harvard, where she graduated *magna cum laude* and was an AOA graduate from Cornell Medical College. She is the recipient of numerous awards and honors and has been elected to both the American Society for Clinical Investigation and the American Epidemiological Society.

As with the other recently appointed Senior Associate Deans, Dr. Parsonnet will perform her new responsibilities part-time. This will enable her to continue her important research and clinical care responsibilities. As such, she will stay engaged with faculty and students as both an active investigator and clinician. I am confident that this will make her even better prepared to carry out and manage the scope of her new responsibilities. She will work closely with the Faculty Senate and our other Senior Associate Deans to review and renew the medical student curriculum, training of MD/PhD students and other combined degree pathways. She will also have oversight over the Medical Scholars Programs and Continuing Medical Education. Dr. Parsonnet will also be the leader of our planning efforts for new education and information center facilities, working closely with other members of the Dean's Office and Stanford Medical Student Association and Graduate Student Association.

I want to thank the very large number of faculty and students who helped in the selection of Dr. Parsonnet for this important position. I am particularly grateful to an internal search committee that was chaired by Dr. Harvey Cohen, Professor of Pediatrics and that included Drs. Don Regula (Pathology), Charlotte Jacobs (Medicine), Mark Krasnow (Biochemistry) and Charles Prober (Pediatrics). I also want to acknowledge the help and guidance I received from the Faculty Senate.

Update on Hospital Issues

Although August generally brings closure to budget proposals and portends the beginning of a new fiscal year, the leadership at Stanford Hospital and Clinics (SHC) has been charged by the SHC Board of Trustees to carry out additional cost reductions before a final FY02 budget can be approved. This was driven by shortfalls in meeting expected budget forecasts and by rising costs, including those for employee health benefits. Accordingly, the Interim CEO, Mike Peterson, has assembled Hospital VPs and several faculty leaders, including Drs. Peter Gregory, Larry Shuer, Norm Rizk, Tom Krummel, Judy Swain and Richard Hoppe, to work collaboratively during the next three weeks to reduce expenses by an additional \$13 million. This requires a careful and expeditious

examination of major cost centers, including personnel as well as supplies and other services.

Without question these new cost reductions, which follow the very significant efforts made during the last several months, present challenges to hospital management. Nonetheless, they are necessary in order to assure continued financial recovery and ultimately, a more fiscally robust SHC.

Although cost-reduction and re-engineering efforts will surely continue into the future at SHC, and virtually every teaching hospital in the USA, it is important to underscore that they will ultimately yield more positive results. This has been the experience at other teaching hospitals and academic medical centers around the country and I am confident that it will take place at Stanford as well. I have been through a somewhat similar situation in the past and understand how difficult this process can be on an entire medical community. In an ironic way, it is similar to running a marathon (something else I have had lots of experience with over many years). Often the last several miles of a marathon are the hardest. Although it is hard to gauge exactly how many more miles we have to go in the current marathon affecting SHC, there will be an ending – and I do believe a victory. The only measure of success that we can accept is an institution that is able to carry out excellent and innovative patient care and which uses new knowledge gained from research to improve the lives of patients and families.

Congratulations to the Center for Clinical Immunology at Stanford (CCIS) Students and Mentors

The faculty members associated with the CCIS under the leadership of Drs. Paul Utz and Gary Fathman did another wonderful job by providing summer research internship to promising high school students. The 8-week internship experience not only exposed students (who were selected from an exceptional group of applicants) to outstanding science, but also helped to fuel their interests to pursue careers in medicine and biomedical research. The Internship culminated in poster presentations by students of their work to faculty, parents and, of course, each other. Dr. James Nelson, Senior Associate Dean for Research, Graduate Education and Postdoctoral Affairs, commented after viewing various posters that “I was impressed with [the students] knowledge of their work and, more importantly, their grasp of the significance of both the biological questions and answers they had obtained. They spoke confidently and all had clearly enjoyed their projects and interactions with CCIS faculty. It is clear that the experience has reinforced their goals to follow science in the future.” This, in the end, is the evidence of the success of such a program.

Again, congratulations to all the students who participated in the CCIS Summer Internship Program and thanks to the faculty of CCIS and the efforts of Drs. Utz and Fathman.

SUMMIT Site Visit

On Monday, August 12th, the SUMMIT (Stanford University Medical Media and Information Technologies) Program was site visited by the National Library of Medicine (NLM), which is part of the National Institutes of Health. Principle Investigator, Dr. Pavarti Dev, and Co-Principle Investigator, Dr. W. LeRoy Heinrichs, did an outstanding job in putting together an excellent series of presentations about a program that is enormously important to the future of medical education.

SUMMIT investigators and staff design, develop, implement and manage on line medical courses. The program has developed both CD-ROM and web based products that support the learning of human anatomy, neuroanatomy, microbiology and nutrition. Additional programs are in development. Moreover, SUMMIT investigators and staff are developing new technologies for education including real-time, remote simulation, virtual labs in physiology and interactive simulated patient experiences.

The NLM reviewers had the opportunity to tour the SUMMIT programs in current operation as well as those in development. Among the venues they learned about was the “Next generation internet gigabit test bed at Stanford”; the anatomy workbench; the surgery workbench; the interactive simulated patient. These and related programs and projects demonstrate how information technology is changing the way medical education will take place in the future and the important role it will play in the future training of medical and graduate students.

I want to thank Drs. Dev and Heinrichs as well as their colleagues and students for the important work they are conducting and for the impressive demonstration they offered to the NLM.

Visit to Palo Alto Medical Foundation

On Monday, August 12th, Dr. Peter Gregory, Dr. Norm Rizk and I visited the Palo Alto Medical Clinic and had the opportunity to meet with Drs. David Drucker and Francis Marzoni. The Palo Alto Medical Foundation began around 1930 and has a long history of medical care and research. A number of distinguished Stanford faculty also have their laboratory programs at the PAMF. Although I have heard much about PAMF since my arrival, this was the first opportunity available for a visit to the Clinic’s facilities on El Camino. During the visit we had an opportunity to learn more of the past history surrounding the PAMF and Stanford and to discuss the important role each plays in this community. We also had a tour of the new facilities, which are certainly impressive. I want to thank Drs. Drucker and Marzoni for hosting us and I will look forward to future visits and discussions with them.

Visit to SLAC

On Wednesday August 15th, Dr. James Nelson, Senior Associate Dean for Research, Graduate Education and Postdoctoral Affairs, and I had a wonderful visit to SLAC (Stanford Linear Accelerator Center). We were kindly hosted by Professors Jonathan

Dorfman, Director, and Keith Hodgson, Associate Director. The visit was stimulated because of the growing alliance between investigators at SLAC and the biomedical research community at Stanford. Ultimately this might lead to a BioX West facility at SLAC that would provide important new interactions enhancing Stanford's efforts in macromolecular crystallography, structural biology, structural genomics and proteomics, and biocomputation, as well as other areas interfacing physics, chemistry, biology, and engineering with potential applications for drug design, imaging, etc.

SLAC is a remarkable facility on a 340-acre campus leased by the federal government on Stanford land. There are two major areas: high energy physics/particle astrophysics and synchrotron radiation (which uses high-intensity x-ray beams for studies in physics, biology, chemistry, medicine and environmental sciences). In addition to the full time staff at SLAC (distinguished by 3 Nobel Laureates), SLAC and SSRL (Stanford Synchrotron Radiation Laboratory) host long and short-term students and investigators from around the world, including 89 U.S. and 58 foreign universities, as well as U.S. companies and laboratories. All the work carried out at SLAC is based on peer reviewed fundamental research that is unclassified and published in leading journals. The record of accomplishment has been exceptional. Among these are a number of very distinguished faculty members from the School of Medicine.

We also had an opportunity to tour some of the facilities and learn more about the future plans for SLAC and SSRL. It is clear that there will be considerable opportunities for important interactions between the School of Medicine and SLAC in the future. Indeed these interactions are likely to prove very exciting both in basic research as well as in applications that can improve approaches to drug development and medical treatment.

Appointments and Promotions

The following appointments and reappointments were reported from the August 15th Advisory Board meeting:

Miriam Goodman was appointed Assistant Professor of Molecular & Cellular Physiology, 9/1/01-8/31/04

Merritt Maduke was appointed Assistant Professor of Molecular & Cellular Physiology, 9/1/01-8/31/04

Marilyn Winkleby was appointed Associate Professor of Medicine (Research), 8/1/01-7/31/07

Sylvia Plevritis was appointed Assistant Professor of Radiology (Research), 9/1/01-8/31/04

Dean's Newsletter September 4, 2001

Notes added the week of Sept. 11:

**East Coast Attacks:
Important Communication to all
Medical Center staff**

CRONA Accepts 2-year Contract Extension

End of Summer and the Beginning of the New Academic Year

Labor Day weekend marks the traditional transition from end of summer to beginning of the school year. During the next week our incoming students will arrive with orientation beginning for medical students on September 10th and for Graduate Students on September 26th. Please do everything you can to welcome our new students.

Bio-X and Clark Center Proposals and Stem Cells

As you know, construction on the Clark Center is underway and is due to be completed in 2003. In recent weeks, the continued support for the Clark Center has come under question because of the impact of President Bush's recent announcements regarding limited federal support for human embryonic stem cell research. Because of the potential impact of this decision on research that might take place in the Clark Center, Mr. Jim Clark made his position and concerns clear in an op-ed piece in the August 31st issue of the New York Times

(<http://www.nytimes.com/2001/08/31/opinion/31CLAR.html?ex=1000274037&ei=1&en=0256adaa9d1e98ba>). Respecting the concerns expressed by Mr. Clark, whose generous support to Bio-X and the Center that will bear his name has made this project become a reality, a number of Stanford leaders, including President Hennessy, Drs Paul Berg, Irv Weissman and this writer, among others, have also noted that there is still important research on human embryonic stem cells that can be conducted, even with the limited number of cell lines that have been identified to date. Moreover, the change of President Bush's former position away from having no federal support for embryonic human stem cell research was at least a step in a direction more favorable to the future of biomedical research and medicine. Moreover, while research on stem cells is extraordinarily important and highly relevant to the future of Bio-X and the Clark Center, it is also clear that there are a number of equally important areas of investigation that can benefit from the fundamental principles guiding interdisciplinary research.

While the debate regarding stem cell research, influenced dramatically by religious and political concerns, as well as ethical issues, will continue to unfold during the months and years ahead, it is also clear that other significant events are transpiring around the Clark Center that will also impact its future. One is the investigators and areas of research that

will populate the Clark Center when it opens in 2003. It is likely that these investigators will be selected around a number of thematic or affinity areas that should, ideally, serve as magnets that draw students and faculty to the Clark Center and that, in turn, stimulate ideas, collaborations and research with students and faculty who are not physically located in the Clark Center. This bi-directional flow to and from the Clark Center will help foster the interdisciplinary research programs envisioned under the broader umbrella of Bio-X.

Currently, the individuals who originally considered joining the Clark Center are being asked to complete their proposals for the final selection process. The Dean's of Medicine, Engineering and H&S, along with the Clark Center leadership, have recently agreed that at this important juncture, the opportunity to become part of the Clark Center should be opened up to all faculty. Accordingly, I am attaching below the proposal application.

If you and your colleagues would like to submit a proposal to join the Clark Center, you are welcome to do so. Please complete the application that follows and submit it to Dr. James Nelson, Professor of Molecular and Cellular Biology and Senior Associate Dean for Research, Graduate and Postdoctoral Education by Friday, October 5th. We will then review and pass on the School of Medicine application to the Clark Center Leadership.

Following is the application:

Clark Center Tasks and Guidelines for Formulation of Thematic Initiatives

TASKS

Create a written document that describes the following:

I. The Science/Technology/Applications

- A. Theme identification, mission/vision/goals
 - a. Identify & describe your thematic plan, and provide the best name for your initiative
 - b. What is your science/technology/application base?
 - c. Describe its interdisciplinary nature
 - d. What Schools/Departments are involved? How are they involved? Who is involved? How is your thematic initiative novel/unique?
 - e. What sets it apart from similar activities here or elsewhere around the world
 - f. Is it sustainable?
- B. Connectivity within the Clark Center
 - a. How are members of your initiative connected to other Clark Center initiatives?
 - b. Describe plans to insure interactions with other proposed thematic groups within the Clark Center, to avoid balkanization or creation of "Centers within the Clark Center"
- C. Connectivity to the Bio-X community at large

- a. Describe plans for an intellectual outreach to the campus Bio-X community at large and satellite facilities
- b. Describe plans to connect with the departments outside the Clark Center who may also be involved in similar thematic research

II. The People

Faculty Participants

- a. Describe the kinds of talent and expertise that your theme will need to be successful in reaching its goals and meeting its vision.æ We want to learn how you plan to fill out the faculty participants in your theme.æ We expect there is a Stanford cadre in place already that will form a core: some of these people will move into the Center and some will not.æ Tell us about them.æ We also realize you may require new hires at either the senior or junior level or both to fill scientific/technical/application gaps.æ Tell us about these folks and the role they will play.æ Enumerate in the following way:
 - i. Colleagues at Stanford who will be part of the initiative/theme, but not move into the Clark Center
 - i. New hires for the Clark Center- number of proposed Junior and Senior positions
 - ii. New hires that need not be in the Clark Center- number of proposed Junior and Senior positions

B. Leadership

Who in your group will step up to provide the leadership to make sure the above goals are met and serve on a Leadership Council consisting of a Director and one member from each thematic initiative?

Who will be your backup in your absence?

III. The Operations

- A. Describe the facility requirements needed for your thematic initiative to be successful in reaching your vision
 - a. Total space needed [aside from "b" below].
 - b. Specialized facilities and space needed for them
 - c. Equipment needed [that you can and can not bring with you]
 - d. Explain how you plan to conserve space by sharing with your colleagues either in your theme or elsewhere in the Clark Center
- B. Describe the financial requirements needed for your thematic initiative to be successfully established in the Clark Center - this could include funds needed to conduct and consummate searches; start-up packages; equipment.æ Clark Center funds are limited [see below] but we do need to capture the financial needs of your theme so that Chairs and Deans are aware of them.

GUIDELINES

There are two major constraints under which we all have to work -- real estate and financial.

- A. Real estate -- Think about ~2000 sq ft assignable space on average throughout the Clark Center (can go above and below for particular members of your initiative, but the average has to land near that number). Clearly full wet space users need something closer to 2500 sq ft on average, while full dry space users need

something closer to 1500 sq ft on average. This is the space occupied by the faculty, students, postdoctoral fellows, administrators, other laboratory personnel and associated wet and dry laboratory facilities, including any offices and support space such as cold rooms and the like.

- B. Financials – Funds available for faculty fit-ups and hiring are precious and limited. It's important for your thematic group to think about creative strategies to minimize expenses related to the establishment of your group within the Center.

New Appointments of Associate Deans for Academic Affairs

Dr. David Stevenson, Professor of Pediatrics and Senior Associate Dean for Academic Affairs, has announced the addition three members to his team, each of whom will bring important skills, knowledge and expertise to benefit our faculty. These include:

1. **Roy J. King, M.D., Ph.D.**, Associate Professor of Psychiatry and Behavioral Sciences, will have a part-time appointment as Associate Dean for Academic Affairs. Dr. King will serve as liaison to the new Committee on Faculty Diversity chaired by Dr. Fernando Mendoza, and will assist with complaints and grievances especially related to sexual harassment and racial or ethnic discrimination. He will also assist in the review of all appointments and reappointments at the Assistant Professor level, with special attention towards achieving gender and ethnic diversity.
2. **Lucy S. Tompkins, M.D., Ph.D.**, Professor of Medicine (Division of Infectious Diseases and Geographic Medicine) and of Microbiology and Immunology, will have a part-time appointment as Associate Dean for Academic Affairs. In her new role, she will assist Lars Vistnes, M.D., in leading the Faculty Mentoring Program, and she will also serve as liaison to the new Committee on Women in Medicine and Science chaired by Dr. Mary Lake Polan. In addition, she will assist in the review of all new appointments and reappointments at the Assistant Professor level.
3. **Maurice L. Druzin, M.D.**, Charles B. and Ann L. Johnson Professor in the School of Medicine, Chief of Maternal-Fetal Medicine in the Department of Gynecology and Obstetrics, and Co-Director of the Johnson Center for Pregnancy and Newborn Services, will have a part-time appointment as Associate Dean for Academic Affairs. As a previous chair of the Appointments and Promotions (A & P) Committee in the Medical School, he has had considerable experience in the A & P process and will focus on matters related to the MCL professoriate in general and assist from time to time in matters related to complaints and grievances, mainly related to appointments and promotions. Dr. Druzin will also assist in the review of all new appointments and reappointments at the Assistant Professor level, bringing to bear on this process his perspective as a MCL faculty member.

The appointment of these three Associate Deans will increase the visibility and accessibility of the Office of Academic Affairs under the direction of David Stevenson, M.D. Moreover, these appointments will help streamline some of the processes related to appointments and promotions and aid further in the development of a proactive approach to a variety of activities that are central to faculty affairs.

Job Well Done by the Office of Medical Development

The Office of Medical Development (OMD) has recorded another very successful year of fundraising. By the near end of the fiscal year, the School of Medicine OMD has exceeded its target and raised over \$109 million, representing the largest percentage of the University's overall Development efforts. It should be also noted that the success by our OMD does not include the considerable fundraising success of the Hospitals, especially the Lucile Packard Children's Hospital. Congratulations to Ms. Jackie Brown and the staff of the Office of Medical Development.

In addition, I have also learned that the Medical Development's communications group has received the Award of Distinction from the Association of American Medical Colleges for their special publications, "Forty Careers in Medicine," and "A Legacy of Medical Innovation." These publications from Stanford were selected for honors from among 130 submissions nationwide. Congratulations to Ruth Schechter and the team for their excellent work

Very well done!

Congratulations to Dr. Judy Swain

Dr. Judy Swain, Arthur L Bloomfield Professor of Medicine and Chair of the Department of Medicine, has been elected to serve as the Chair of the University Advisory Committee on Academic Appointments and Promotions. This is an extremely important appointment and evidence of the esteem with which Dr. Swain is held by colleagues and leaders throughout Stanford University.

Appointments and Promotions

Dr. Jeffrey D. Axelrod, Assistant Professor of Pathology, 9/1/2001 to 8/31/2002

Dr. Laurence C. Baker, Assistant Professor of Health Research and Policy, 8/1/2001 to 7/31/2002

Dr. Lynne C. Huffman, Assistant Professor (Research) of Pediatrics (General Pediatrics), 10/1/2001 to 9/30/2002

Dr. Joanna L. Mountain, Assistant Professor of Anthropological Sciences and of Genetics, 9/1/2001 to 12/31/2004

Dr. Sylvia K. Plevritis, Assistant Professor (Research) of Radiology. 9/1/2001 to 8/31/2004

Dr. Lawrence Hammer, Pediatrics, Promotion to Professor (MCL) effective 9/1/01 for a continuing term.

Dr. Glenn Otto, Comparative Medicine, Promotion to Associate Professor (MCL) effective 11/1/01-10/31/06

Dr. Kendra Peterson, Neurology and Neurological Sciences, Promoted to Associate Professor (MCL) effective 9/1/01-8/31/06

Congratulations to all.

Dean's Newsletter September 17, 2001

Reflections

The events of the past week at Stanford cannot be reported in exclusion of those that have transfixed and transformed our lives as citizens and as a nation. From the perspective of individuals working in medical schools and hospitals, where our life's work is improving the quality and duration of human health and well being, the acts of violence and destruction that have occurred in New York and Washington are all the more senseless. That they were followed by a bomb threat at our Hospitals on Thursday, September 13th, leading to the evacuation of infants, children and adults, underscores the sad and tragic depths to which human nature can fall. This has been a week where life's moral compass has been truly lost.

I am certain that while every member of our community has been deeply touched and affected by the recent tragedies, some have lost friends and loved ones. Our thoughts and prayers are extended to all.

It is also important that as healers and members of academia, we call ourselves to a higher order. That we focus on the value of life. That we do not permit our anger to be indiscriminate or stereotyped. That we find ways to forgive and remember the importance of working on behalf of humanity.

Resources Available to Help Cope with Terror

The following message comes from Dr. David Spiegel, Professor of Biology and Behavioral Sciences:

“The attacks on the United States were sudden, violent, unexpected and have left everyone understandably upset. From years of research on how people respond to traumatic stressors we have learned that they need to take time to process their normal reactions to such abnormal events. The feelings initially aroused include fear, sadness, anger, horror, helplessness, and a sense of unreality. Such reactions are expectable, and it is helpful to express rather than suppress them.

Talk to others about your reactions and you will discover that you are not alone, and that others are as deeply affected as you are. We have lost our sense of invulnerability, and this can make anyone feel edgy, exposed, and afraid. Take time from your usual routines, both work and personal, to think and talk through what these attacks mean to you. The sense of helplessness engendered by the attacks can be acknowledged and responded to by thinking of something you can do: contact loved ones in endangered areas, seek information, offer to help donate blood, organize meetings, or provide emotional support to others who may be even more affected. At times like this we take great comfort in our emotional resources - friends, family, faith, and community.

In the immediate aftermath of such tragedy, take time to come to terms with it: think and feel it through, and feel a part of a community of people who are doing the same thing. Such an assault is designed to tear apart the fabric of our community, so weaving it back together is a healing act”.

There are numerous resources available to help you. Many may find comfort from even brief contact with one or more of these (and other) available Stanford programs. Others may find that this stress, added to the burden of earlier problems, such as depression, anxiety, or substance abuse and that these people may need more intensive help. Please contact the program or programs that you think will best meet your needs:

Stanford Help Center:	(650) 723 4577
Cowell Counseling and Psychological Services:	(650) 723 3785
Chaplaincy	(650) 723 1762
The Bridge Peer Counseling Center:	(650) 723-3392
Stanford Psychiatry Clinic:	(650) 498 9111

In addition, the Child Health Information Center of the Children’s Defense Fund also offers resource to help children cope with tragedy. These include:

*The Parent Center
www.parentcenter.com/general/34754.html

*American Academy of Pediatrics
www.aap.org/advocacy/releases/disastercomm.htm

*American Psychological Association
<http://helping.apa.org/therapy/traumaticstress.html#children>

*American Academy of Child and Adolescent Psychiatry
<http://www.aacap.org/>

Welcoming the Incoming Class of 2001

On September 10th, we welcomed our new Medical School class to Orientation and Stanford. Dr. Gabriel Garcia, Associate Professor of Medicine and Associate Dean for Medical School Admissions, shared some of the demographics of our incoming class of 86 students. This class was selected from a pool of 5,813 applicants and includes students from throughout the United States and world. Of the 86 students, 47 are women and 37 are men. This diverse class is comprised of 26 ethnic minorities (excluding Asian students), including 5 African American, 15 Mexican American, 2 Native American, 1 Native Hawaiian and 3 Hispanic students. The average age is 25.25 years, with a range from 20-34 years. The undergraduate degrees were obtained at 42 colleges and universities, with 15 students coming from Stanford and 14 from Harvard. In addition, 14% of the incoming class holds advanced degrees.

I had the personal pleasure of welcoming our new students on their first day of orientation and had the opportunity to meet many of their families at the Stethoscope Ceremony on Thursday evening, September 13th. I hope you will also have an opportunity to welcome them in the days and weeks ahead.

Executive Committee Meeting Reports

At the September 7th Executive Committee meeting two related topics that impact the School and Medical Center were discussed. The first relates to our overall strategic planning efforts and the second to research space.

Strategic Planning Efforts: I have previously outlined my views regarding the overall strategic directions for the School of Medicine (see April 2nd Newsletter). During the past several months, we have carried out some of the preliminary planning efforts and we are now planning to initiate a consolidated school-wide strategic planning effort that will culminate in a 5-year action plan. The Strategic Planning effort to date has engaged Senior Deans within the School, but will now move forward to include the Executive Committee, the Faculty Senate, faculty, students and Hospital leaders. The Strategic Planning effort will begin with a determination of our mission and overarching goals. While these require further debate and refinement, at this juncture I will state them as follows:

Mission:

To be a leading research intensive School of Medicine that improves the health of children and adults through education, clinical innovation and biomedical research.

Overarching Goals:

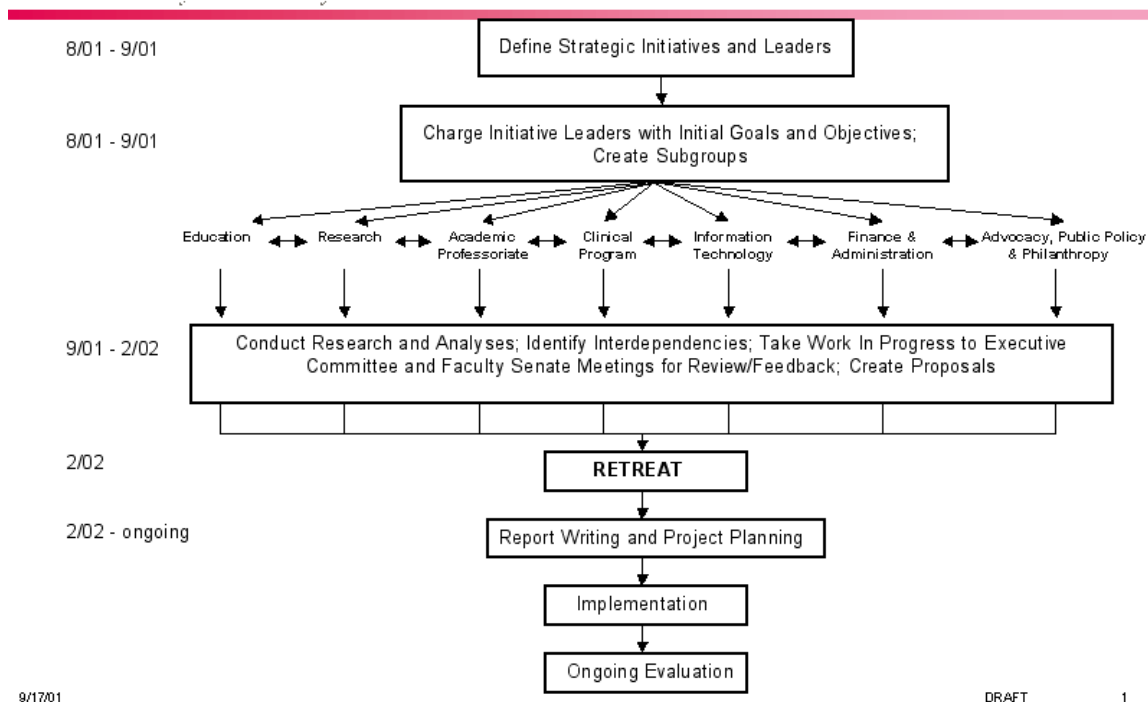

- To make Stanford the national leader in the reformation and rejuvenation of research intensive Medical Schools in the education and career development of thought leaders.
- To transform the future of biomedical research and teaching through novel and innovative alignments and collaborations between basic and clinical scientists and through interdisciplinary partnership and collaborations with investigators and scholars throughout the University, as well as with public and private partners worldwide.
- To provide innovative clinical care to adult and pediatric patients.
- To re-engage the public-trust in respecting the value and importance of Medical Schools and academic medicine because of their contributions to outstanding patient care through education and research.

In order to address these goals, we plan to engage in a consolidated strategic analysis of seven critical program areas: Education, Research, Academic Professoriate, Clinical Programs, Information Technology, Finance and Administration, Advocacy, Public Policy and Philanthropy. Under the leadership of the cognizant Dean, subcommittees will be formed for each area. These subcommittees will define each area's mission, immediate goals and objectives, long-term goals and objectives and the interrelationships with other mission critical areas. The Strategic Planning effort will include program development and capital needs, including facilities. Among these will be our priority for a Learning and Information Center as well as the potential need for additional research space. An important aspect of our Strategic Planning effort will focus on the important interrelationships and interdependencies of each of our missions. One impacts the other making it essential, at this important juncture, to think clearly and wisely about our investments and expectations.

We plan to bring all the subcommittee reports to a Retreat that will be held in February of 2002 and from that develop our consolidated Five Year Plan. Prior to the retreat, however, we plan to discuss specific strategic areas at the Executive Committee, Faculty Senate and Town Meetings.

The graphic below illustrates this planning process:

Process for Achieving Strategic Initiatives

My goal is to engage as much input as possible from faculty and students so that we can assure a shared investment in this effort.

I recognize that Strategic Planning is not unique or new. However, at this important juncture I do believe that bold planning is necessary so that we can assure that Stanford sustains and enhances its excellence as a “research intensive School of Medicine that improves the health of children and adults through education, clinical innovation and biomedical research.” I will also plan to use the Newsletter as a way to keep you informed of our progress. Most importantly, we have every intention of implementing the recommendations that will emanate from this important process.

School of Medicine Space Planning: Another important topic for presentation and discussion at the September 7th Executive Committee meeting was research space throughout the Medical School. Professor James Nelson, Senior Associate Dean for Research, Graduate Student and Postdoctoral Education, led the discussion. Dr. Nelson reviewed the dramatic changes in space density within the medical school area that has occurred during the past 40 years. In 2001 the School of Medicine uses 1, 117,610 nsf of space, including 256, 757 nsf of leased space. Of the total space, 212,151 nsf is occupied by the School’s Basic Science departments and 555,189 nsf by the Clinical Science departments. Although projections for additional space for research, education, animal facilities, and

administration are incompletely analyzed, potential needs of over 400,000 nsf have been noted. Given the termination of the GALE project this past January, the GUP restrictions on overall academic space, and priority needs (e.g., School of Medicine Learning and Information Center), it is all the more important to carefully assess current space use and future projected needs.

Accordingly, Dr. Nelson announced that effective immediately, there will be a six-month moratorium on all requests for incremental space. During this period, a space inventory will be conducted that will identify the space currently occupied by each faculty member, including: the sponsored support for that space; other funding support available to the investigator; size of faculty, students and staff using the space; and an assessment of the impact and priority of the research being conducted. This process will allow us to better define the overall prioritization of currently existing research efforts, both within departments as well as within interdisciplinary programs. Based on this we will begin the process of using space reserves and newly identified space to meet our highest priority needs. We will also carry out, under Dr. Nelson's leadership, a Five-Year plan for the School of Medicine's research facilities requirements. This will be conducted as part of the overall Strategic Plan discussed above. The data emerging from these analyses will be shared as broadly and as transparently as possible. Again, details will follow in future Newsletters.

Faculty Leadership Group and Internal Governing Council Discussions on Funds Flows

In the May 29th issue of the Dean's Newsletter, I reviewed the various ways that funds flow between the Medical School and University and between the Hospitals (both Stanford Hospital & Clinics (SHC) and Lucile Packard Children's Hospital (LPCH)). I have also indicated in recent Newsletters that because of the financial challenges facing the Hospitals, especially SHC, the amount of money transferred to the School for clinical and administrative functions performed by faculty was reduced by approximately 25% in FY01. Similar reductions are being sustained in this current fiscal year (FY02) which began in September. I have also previously indicated that there has been a commitment to better rationalize the ways that Hospital Support for clinical services rendered by our faculty is distributed. During the past two months, Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, has been working with clinical chairs and Hospital Administration to develop guidelines for distributing the remaining dollars to pay for services rendered by clinical faculty.

In order to expeditiously determine the more appropriate distribution of these funds, an Advisory Group of Payments for Services Rendered has been appointed and will be chaired by Dr. Gary Glazer, Professor and Chair of Radiology. The Advisory Group will include physician leaders from Hospital Based Medical and Surgical Departments, the

Dean's Office and Hospital Administration. Recommendations from this Committee will need to be implemented by November 1st. Their objectives will include:

1. To complete the development of the incentive plan.
2. To divide the current funds labeled as "program support" into services we would regard as "essential" and those available for funding the incentive plan.
3. To define further the "special lab" revenues that would be cost accounted and then provided to specific departments.
4. To facilitate the review of pathology service funding already started.
5. To generate a plan to mitigate the dislocations of these alterations to the current fiscal year's budget.

Following this, other aspects of the funds flow will be further examined to ensure that medical direction monies, fellowship support, and those services we have deemed "essential" are appropriate in amount.

I want to thank Drs. Glazer and Rizk for their leadership and for the participation of both Hospital and Medical School leaders in committing to bring this effort to rapid completion. It is enormously important but also one that will surely generate considerable additional challenges.

Congratulations to Dr. Joe Hopkins

Dr. Judy Swain, Professor and Chair of the Department of Medicine, has announced that Dr. Joe Hopkins has accepted the position of Associate Chief for Clinical Affairs for the Division of General Internal, Family & Community Medicine. Please join me in congratulating Joe on his expanded responsibilities and in applauding his excellent work on behalf of the Division and of the Medical Center.

Appointments and Promotions

David Schneider has been appointed as Assistant Professor of Microbiology & Immunology, 9/1/01-8/31/04

Emmanuel Mignot has been promoted to Professor of Psychiatry and Behavioral Sciences, effective 9/1/01

Laurence Baker has been promoted to Associate Professor of Health Research and Policy, with tenure, effective 9/1/01

Congratulations to all.

Dean's Newsletter

October 1, 2001

Six Months Already

It seems amazing, at least to me, to think that six months have already passed since I began as Dean on April 2, 2001. I want to thank the many faculty, students and staff who have welcomed me and who have been so enormously helpful during my introduction to Stanford. Your wisdom, support, advocacy and engagement has been notable and deeply appreciated.

I fully recognize the many important challenges we have and will continue to face during this exciting time in education, biomedical research, and health care delivery. I believe that the months and years ahead will shape the future of medical education and research and that we must play an important role in that process. I look forward to working with you during the next six months as we address the strategic initiatives I outlined in the

September 17th Newsletter: http://deansnewsletter.stanford.edu/archive/09_17_01.html#5

Indeed, during the next six months we will begin to address the important priorities we will need to establish at Stanford in education, research and clinical care. These will further define our directions in education and the "Learning and Information Center" where they will occur. We will also need to address our research directions within the School and their relationship to other Schools at Stanford, as well as the public and private resources that connect us to our global community. As with our mission in education, setting our priorities in research will help define what additional research facilities will be necessary during the next decade to achieve our objectives. Similarly, we will need to focus further on our clinical mission, both in its impact on patient care as well as in medical and graduate student education and as the beneficiary of our efforts in clinical research. Ultimately, these and our related goals and objectives will help assure that Stanford be the leading research intensive School of Medicine that improves the lives of children and adults through education, clinical innovation and biomedical research.

We have a lot to do but I look forward to working on these enormously important issues with you in the months and years ahead.

Welcome to the Biosciences Graduate Students Entering Class of 2001

During this past week we had the opportunity to welcome the Biosciences Entering Class of 2001 to Stanford. This year's class includes 98 students who will pursue graduate studies at Stanford. It was a pleasure to personally welcome the entering class at a dinner on Tuesday September 25th.

Special thanks must go to Dr. Karla Kirkegaard, Professor of Microbiology & Immunology and Dr. Tim Stearns, Associate Professor of Biological Sciences, for their work as Co-Chairs of the Committee on Graduate Education and Policy. The Schools of Humanities & Sciences and the School of Medicine participate in the Biosciences

Graduate Education Program that permits students to align with 12 Home Programs. These include Biochemistry, Biological Sciences, Biophysics, Cancer Biology, Developmental Biology, Genetics, Immunology, Microbiology & Immunology, Molecular & Cellular Physiology, Molecular Pharmacology, Neurosciences and Structural Biology.

The Biosciences Graduate Education Program at Stanford ranks among the very best in the world, largely because of the contributions of our faculty and students and the exceptional resources within and around the University. I also want to thank our leadership in the School of Medicine, including Dr. W. James Nelson, Rudy J. & Daphne Donohue Munzer Professor and Senior Associate Dean for Research, Graduate and Post-Doctoral Education, and Dr. Ellen Porzig, Associate Professor (Teaching) and Associate Dean for Graduate Education.

Update on Clinical Issues and Challenges

Hospital Matters: On Thursday September 20th, the Board of Directors for Stanford Hospital & Clinics (SHC) reviewed and approved the FY02 budget that was recommended by Mr. Mike Peterson, Interim CEO. This was based on the significant progress that the Hospital Administration, working closely with faculty leaders, had made in August and early September in further reducing expenses. The Board recognized the significant progress that had been made which could, if realized, have the “run-rate” for SHC nearly break-even by the fourth quarter of FY02. That said, Mr. Peterson and the Board recognize that there is a major amount of work yet to be done and that attention to additional reductions during the year will be necessary. Moreover, implementing the recommendations that have already been made will be the more difficult challenge and will require resolve and determination by SHC and the faculty to make sure that the planned targets are achieved.

An important part of the success of the plan proposed by Mr. Peterson rests on achieving the volume and revenue targets on which the budget has been built. Because of the rapid shifts going on in the health care environment, including the decision by the Medical Center to exit from capitated care, making firm predictions about volume is more complicated. To assist this, monthly monitoring reports that address volume achievements and variances, including annualized trend data, will be available for review and scrutiny by the Turn Around Committee and by the Medical Center Internal Governing Council. Focusing attention on areas where expectations are not being met will better permit the Administration to make the necessary changes and accommodations to assure that the fiscal health of SHC is controlled more successfully.

In a related matter, the Search for the permanent CEO of SHC remains open and active. Although there had been active discussions with a potential candidate, it was decided by mutual agreement that it would be better to consider additional choices and options. That process is underway under the leadership of the Chair of the SHC Board of Directors, Ms. Denise O’Leary. As information unfolds, I will share it with you.

Clinical Faculty Issues: In tandem with the issues being addressed at SHC and the Lucile Packard Children's Hospital, considerable work is underway to address equally important financial concerns for our faculty. These include the important topic of payments for clinical services rendered by the faculty to the Hospitals, as well as the related issues of physician and hospital service and financial performance, and the necessary incentives to optimally align these and make them more successful. Again, I will update you on these discussions in the coming weeks.

Thanks Again to Dr. Peter Gregory

On Wednesday September 19th, members of the Faculty and Hospital gathered to thank Dr. Peter Gregory for the tremendous contribution he has made to the Medical Center during his career at Stanford. In addition to being a Professor of Medicine, Dr. Gregory served as Senior Associate Dean for Clinical Affairs for the School and as Chief Medical Officer at SHC since 1989. His involvement in virtually every issue that impacted the interface between physicians and faculty has been praised and respected. I am particularly appreciative that Dr. Gregory agreed to extend his appointment through the end of August, so that I could benefit from his wisdom, help and support during my first months at Stanford. Please join me in thanking Peter for all that he has done. I am also quite certain that he will continue to make important contributions, both during his sabbatical and upon his return to the faculty.

School of Medicine Faculty Senate Opens New Academic Year

On Thursday, September 20th, the Medical School Faculty Senate [<http://www-med.stanford.edu/senate/>] held its first meeting for the new academic year. Dr. Lorry Frankel, Chair of the Senate, also reviewed the role of the Senate within the School. The following is excerpted from his presentation:

“The Medical School Faculty Senate represents the will and opinion of the faculty of the School and establishes policy for the admission, curriculum, and academic performance for MD and PhD students. In addition, the Senate has been charged with advising on academic matters related to housestaff and postdoctoral students. In addition, the Senate advises the School of Medicine on matters related to faculty welfare including legal representation.”

Through its by-laws, the Senate is made of 55 members, of whom 37 are elected or appointed by departments and 18 serve as Senators-at-large and are elected by faculty in basic science or clinical departments. In addition, there are both ex officio members and non-voting members. The Ex-officio members include Faculty representatives of Interdisciplinary Programs and Centers (IDPs) and the Dean of the School of Medicine. Non-voting members include a medical student representative, a graduate student representative, a Voluntary Clinical Faculty representative, an Alumni representative and a Housestaff representative.

Currently, Ms Elizabeth Moreno serves as the Executive Secretary and she works closely with the “Committee of Five” that serves as the Executive Committee of the Senate and is comprised of elected Senate members. Current members of the Committee of Five include Dr. Lorry Frankel (Chair), Drs. Leonore Herzenberg, Myer Rosenthal, Oscar Salvatierra and Robert Siegel.

Finally, there are also some important Standing Committees of the Faculty Senate for the Medical Student programs, including:

1. ***Committee on Admissions.*** Dr. Gabriel Garcia, Chair
2. ***Committee on Courses and Curriculum.*** Dr. J. Edwin Atwood, Chair
3. ***Committee on Student Performance.*** Dr. Lawrence Mathers, Chair
4. ***Medical Student Scholars Committee,*** Dr. Brian Hoffman, Chair.

I hope this overview provides useful information regarding the role and composition of the Faculty Senate.

Appointments and Promotions

I am pleased to announce the following appointments, re-appointments and promotions of our faculty.

Daniel Bloch has been promoted to Professor of Health Research and Policy (Research), 9/1/01-8/31/07

Albert Koong has been appointed Assistant Professor of Radiation Oncology, 9/1/01-8/31/04

R. Lane Smith has been re-appointed Professor of Functional Restoration (Research), 9/1/01-8/31/04

Congratulations to each.

Selecting a Health Plan that Provides Access to Stanford Faculty

As you likely know, there have been a number of important changes to the health care plans available to faculty and staff of the Medical Center and Stanford University and its School of Medicine. One of the important questions is which plans will permit subscribers to have access to Stanford School of Medicine faculty. Because this question is being asked frequently and since this is “open enrollment season”, I thought it important to pass on the following information. For calendar year 2002 the only health plan option that will be available to University and School of Medicine employees that provides for full access to Stanford Faculty Physicians is the Cigna PPO plan. We recognize that this option will be more expensive, but it will provide employees full access to a Stanford Faculty Physician, they should select the Cigna PPO at open enrollment.

Thanks to Dr. Gene Bauer

On Monday, October 8th, we received the official announcement from Dr. Gene Bauer that he plans to step down from his position of Vice President for the Medical Center effective December 1st. At the same time we received notification by President John Hennessy that he does not plan to fill the position of Vice President. Instead, he has appointed a Medical Center Executive Committee to integrate and coordinate the intersecting activities of the School of Medicine, Stanford Hospital & Clinics, and the Lucile Packard Children’s Hospital (see below).

Having known about Dr. Gene Bauer’s decision for the past several months, I want to take this moment to thank him personally and publicly for all that he has done for the School of Medicine and the Medical Center during his tenure as Dean, Dean/VP and, most recently, Vice President. Those who have been here during the past several years are well aware how very challenging this period has been for medicine in general and Stanford in particular. Dr. Bauer and his colleagues worked diligently to forge the merger between Stanford and UCSF, only to have to unwind those significant efforts in the Spring of 2000. Despite these very significant challenges, the Medical School continued to flourish during Dr. Bauer’s leadership, marked by important new faculty recruitments, key leadership appointments, new research facilities and the continued attraction of exceptional medical and graduate students.

On a personal note, I want to thank Dr. Bauer for the tremendous support and help he has provided to me since I arrived in April. He has been a true friend and colleague. I also want to thank Mrs. Gloria Bauer for her dedication and commitment to the School, Medical Center and University. Together, Gene and Gloria Bauer have made an important difference and we owe them our gratitude and appreciation.

I look forward to a more formal opportunity to thank the Bauers and wish them well, especially during Gene’s well-deserved upcoming year of sabbatical.

Appointment of the Medical Center Executive Committee

As noted above, with the decision to not replace the position of Vice-President, President John Hennessy has announced the formation of the Medical Center Executive Committee. While recognizing that the Stanford University School of Medicine, the Stanford Hospital and Clinics, and the Lucile Packard Children's Hospital each have a separate and somewhat distinct mission, the overall success of both the combined entity and the individual components depends on a strong working relationship among the three organizations. Working in conjunction with the Board of Trustees, the hospitals' Boards of Directors, the Governing Council, SHC's senior management and LPCH's Executive Committee will oversee the planning and coordination of the school and the two hospitals to ensure the strong working relationship among the three organizations continues. The team will be involved in a wide range of issues, including strategic planning, contracting, clinical productivity, financial performance, funds flow, compensation and changes in clinical programs. The will also work to resolve conflicts within the Medical Center through communication, shared values and creative compromise. The members of the Medical Center Executive Committee include the Dean of the School of Medicine, who serves as Chair, and the CEOs of Stanford Hospital and Clinics and the Lucile Packard Children's Hospital. At their discretion, additional individuals from the School or Hospitals will be invited to participate.

It should also be noted that with the elimination of the position of Vice-President, the CEOs of each hospital will have their primary reporting relationship to their respective Board of Hospital Directors. The Dean will continue to report to the Provost and President. The first meeting of the Medical Center Executive Committee was held on Monday, October 15th. The Committee will meet weekly or, if necessary, more frequently.

Clearly every new organizational structure has its opportunities and challenges. Regardless of the organizational structure, however, is the need for a broad vision and commitment to the future of the School and its very important relationships with SHC and LPCH. I am confident that the Dean and CEOs will work together closely to assure that these important interrelationships, and the value they bring to our patients and community, are sustained and enhanced.

Medical Center Committee of the Board of Trustees: Clinical Research

Among the topics discussed at the Medical Center Committee of the Stanford University Board of Trustees meeting on Monday, October 8th, was the role of the Medical School in clinical research. Dr. Charles Prober, Professor of Pediatrics and of Microbiology & Immunology and Chair of the Dean's Task Force on Clinical Research, provided an excellent summary of clinical research and the important role it plays for our faculty,

students and trainees, School and Hospitals. Dr. Prober's presentation focused primarily on "patient-oriented" clinical research, including translational research, the development of new technologies, studies of mechanisms of human disease, epidemiological studies, behavioral studies, outcomes and health care services studies and clinical trials. Dr. Prober also differentiated between clinical care (i.e., the practice of medicine on a single patient, without an attempt to gain systematic knowledge from the intervention), and clinical research (i.e., the conduct of a controlled and regulated approach to patient care that is explicitly designed to gain systematic knowledge from the intervention). He further demonstrated the important results that have been accrued to the conduct of clinical research, illustrating the impact of AIDS and pediatric cancer, and pointed out why an investment in clinical research is so important to an academic medical center.

At the same time, conducting clinical research necessitates scrupulous care and attention to assure human subject safety. Because this necessarily carries risk, Dr. Ann Arvin, Professor of Pediatrics and of Microbiology & Immunology and Associate Dean for Research, Stanford University, reviewed the various University Policies governing research compliance and human safety. Dr. Arvin noted that the Office of the Dean of Research, at the University level, has the responsibility to oversee all the panels which evaluate the research risks. These include the Institutional Review Boards (IRBs), Biological Safety, Radiation Safety, and Laboratory Animal Care Regulations. Policies regarding research are governed by the US Department of Health & Human Services, the NIH, FDA, VA and Stanford University.

A fundamental tenet is that no human subject may participate in research without IRB approval and informed consent. In considering proposals, the IRB must consider the risks vs. anticipated benefits, if any, for the individual. They must also give special consideration to research involving pregnant women, fetuses, children, or the cognitively impaired. In addition, consideration is given to the importance of knowledge reasonably expected to result from the research and the adequacy of the informed consent.

Currently there are three IRBs operating at Stanford under the Direction of Ms. Kathy McClelland. Rodney Johnson serves as the Liaison to the Legal Office. Faculty participation is critical to the success of the IRBs along with that of lay members. *Three IRBs review medical research. Detailed information is available through stanford.edu/dept/DoR/rph/index.html*

Medical Grand Rounds On October 18th Will Address Bioterrorism

Recognizing that it is a sad testimony on society that the medical profession must turn its attention to bioterrorism, the unfolding world tragedies make this a necessity. At the Internal Governing Board on Friday, October 12th, discussion about the Hospital and Medical School's disaster plans and state of preparedness to new threats was addressed. Formal recommendations will be forthcoming in the next several days.

Further recognizing the many concerns that have arisen due to the anthrax cases reported these past weeks, the topic for Medical Grand Rounds [<http://grandrounds.stanford.edu/>] on Thursday, October 18th has been changed to **Physician Preparedness for Bioterrorism**. The speaker, Dr. Shelley Salpeter, a faculty member at Santa Clara Valley and a clinical professor at Stanford, has been working in conjunction with the Santa Clara County Public Health Department on this issue. Medical Grand Rounds are held in the Fairchild Auditorium on Thursday mornings at 8:00 a.m.

Strategic Planning Retreat Update

As reported in the September 17th Dean's Newsletter, we will be holding a Strategic Planning retreat February 8-10, 2002. In order to make the retreat effective, we will be doing a great deal of pre-work. During the next couple of months eight working groups will be defining the mission, vision and strategic initiatives for their respective areas. These groups will be working under a strict timeline and with clearly stated objectives. Discussions will come back to the Executive Committee for updates and to ensure that the efforts of all groups are integrated. In addition, we will be scheduling Town Meetings so that the larger Medical School audience can participate in this process. The goal of the retreat will be to identify those priorities we think are the most compelling and important to our future. This will also help to inform our fundraising strategies.

Following the retreat we will hold on-site meetings focusing on specific areas in more detail. Once a year we will hold a Leadership Retreat so we are sure to stay in touch with our mission. In this way the February retreat will function as a catalyst to future strategic work and related planning efforts.

Space Planning Update

As you may also recall from the September 17th Dean's Newsletter, a Space Inventory is currently underway. The focus of this inventory, being led by Dr. James Nelson, is to identify how much space is in each of the Departments, how it's being used and who is occupying it. The goal of this inventory is to obtain data that will be used to inform how resources are allocated. I greatly appreciate the help being provided by the DFAs and the Chairs to complete this important process.

Congratulations to Dr. Steve Galli

It is a pleasure to inform you that Stephen Galli, M.D., Mary Hewitt Loveless, M.D. Professor in the School of Medicine and Chair of the Department of Pathology and Professor of Microbiology and Immunology, has been elected to membership in the *Accademia Nazionale dei Lincei* (the National Academy of the Lynxes). His official induction will take place in November. The President of the Italian Republic will receive the newly elected members of the *Lincei* at the Quirinale Palace on November 14th. Dr. Galli was recognized for his work on the regulation of mast cell and basophil development and function. Galli's group developed methods to grow populations of mast

cells *in vitro*, from either hematopoietic progenitors or from embryonic stem cells, and to use such mast cells to repair selectively the profound mast cell deficiency of genetically mast cell-deficient mice. Galli's group and others now use such "mast cell-reconstituted genetically mast cell-deficient mice" to define the specific contributions of mast cells, and of individual mast cell receptors, signaling pathways or products, to the expression of diverse adaptive or pathological biological responses *in vivo*.

The history of the *Accademia Nazionale dei Lincei* is notable, as it was founded in 1603 by 18-year-old Federico Cesi, the Marquis of Monticelli. The desire of the founders was to "see into the secrets of nature with a perception as acute as that of the lynx", hence the Academy's name. Recognized as the oldest secular scientific academy in the Western world, it has participated in its share of historical events, including siding with early member Galileo Galilei (who became a Lyncean in 1611) during his dispute with the church at Rome over the tenets of Copernicus.

Please join me in congratulating Dr. Galli. Clearly this is both a personal and an ancestral accomplishment!

Congratulations to Medical Student Melanie Watkins

I was very pleased to learn from Dr. Ron Garcia that Melanie Watkins was selected as the 2001 Herbert Nickens Scholar based on her outstanding community work and scholarship. Ms. Watkins will receive her award during the annual meeting of the American Association of Medical Colleges that will be held Washington, D.C. in early November.

Appointments and Promotions

I am pleased to announce that the Advisory Board has approved the following promotions and appointments:

Robert Rouse has been promoted to Professor of Pathology at SUMC, effective 9/1/01.

Athena Cherry has been promoted to Associate Professor Pathology at SUMC, effective 9/1/01.

Nishino Seiji has been promoted to Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 10/1/01.

Yvonne Karanas has been appointed Assistant Professor (Plastic & Reconstructive Surgery) at SUMC, effective 9/1/01.

Karl Sylvester has been appointed Assistant Professor (Pediatric Surgery) at SUMC, effective 9/1/01.

Barbara Sourkes has been appointed Associate Professor of Pediatrics and of Psychiatry & Behavioral Sciences at LPCH, effective 9/1/01.

Congratulations to all.

Dean's Newsletter

October 29, 2001

Response to Bioterrorism

During the past two weeks, a multidisciplinary Task Force on Bioterrorism and Emergency Preparedness has been constituted. Dr. Eric A. Weiss, Assistant Professor of Surgery (Emergency Medicine), is serving as Chair and has worked diligently with faculty as well as Hospital(s) and School Administration to develop a comprehensive preparedness plan. Although it is understandably lengthy, I am taking the liberty of including a nearly complete version of his report in this Newsletter so that every member of our community has the opportunity to become familiar with this information. I recognize that the information that follows has different degrees of relevance to readers. However, I am making the assumption that it is preferable to inform as many of our as possible, regardless of the specific role they might play in implementation. In sending this information, I want to thank Dr. Weiss and his colleagues for their diligence and commitment during this troubling period of human history and for making informative documents such as this available for our community.

Introduction

The Stanford Hospital and Clinics (SHC) & Lucile Packard Children's Hospital (LPCH) Bioterrorism Response Preparedness Plan was developed by the Bioterrorism Planning Task Force to prepare our hospitals and community for a bioterrorism event. The task force has representation from all relevant Departments in both SHC and LPCH as well as representation from the University Environmental Safety Program and the School of Medicine Safety Office. The committee is tasked with coordinating our own disaster planning with Federal, State, County and Local directives in order to insure the highest possible level of safety for our patients, physicians and staff.

Reducing the incidence of transmission of infectious agents such as plague, smallpox and viral hemorrhagic fevers to staff, patients, and the community will depend on how rapidly victims, including the worried-well, can be triaged, diagnosed, isolated when necessary, and treated. Early communication with the local health departments will be essential in controlling or preventing disease transmission and providing public assurance. As information related to recognizing, diagnosing, treating, and preventing bioterrorism is updated at the federal and state level, this plan will be revised accordingly.

What is Bioterrorism?

Bioterrorism is the deliberate release of pathogenic microorganisms (bacteria, viruses, fungi or toxins) into a community. The most likely diseases associated with bioterrorism include anthrax, smallpox, botulism, plague, and tularemia. Additionally viral

hemorrhagic fever (VHF) viruses such as Lassa, Marburg, and Ebola rarely, if ever, identified in North America, may be deliberately introduced. Other potential agents include brucellosis, western and eastern equine viruses that cause encephalitis, Q fever, glanders, and toxin-producing *Staphylococcus aureus*. With the exception of small pox, VHF, and the encephalitis viruses, all bioterrorism agents can be treated with antibiotics or toxin antagonists if promptly diagnosed. Persons who received one or more smallpox vaccinations before the disease was declared eradicated worldwide have little or no immunity and virtually every living person in the world is now susceptible to the disease. There is no treatment for smallpox and, to date, there is a limited supply of vaccine available in the U.S. The above-mentioned diseases are not meant to be all-inclusive since there are many food- or water-borne agents that could potentially be used in a bioterrorist event.

Recognizing a Bioterrorist Event

The key to rapid intervention and prevention is to maintain a high level of vigilance. To minimize the number of casualties, early identification that an outbreak is from an unnatural source is essential. A bioterrorist event may be suspected when increasing numbers of otherwise healthy persons with similar symptoms seek treatment in our hospital emergency departments, physician's offices, or clinics over a period of several hours, days, or weeks. The early clinical symptoms of infection for most bioterrorism agents may be similar to common diseases seen by health care professionals every day. The principles of epidemiology should be used to assess whether the patient's symptoms are typical of an endemic disease (influenza) currently circulating in the community or an unusual event.

The task force strongly recommends early and liberal use of laboratory tests for the rapid diagnosis influenza. Negative test results may alert health care providers to an unusual illness, and positive results should facilitate treatment with effective anti-viral medications.

The most common features of an outbreak caused by bioterrorist agents include:

- A rapid increase (hours to days) in the number of previously healthy persons with similar symptoms seeking medical treatment;
- A cluster of previously healthy persons with similar symptoms who live, work, or recreate in a common geographical area;
- An unusual clinical presentation;
- An increase in reports of dead animals;
- Lower incident rates in those persons who are protected (e.g., confined to home; no exposure to large crowds);
- An increased number of patients who expire within 72 hours after admission to the hospital;
- Any person with a history of recent (within the past 2-4 weeks) travel to a foreign country who presents with symptoms of high fever, rigors, delirium, rash (not characteristic of measles or chickenpox), extreme myalgias,

prostration, shock, diffuse hemorrhagic lesions or petechiae; and/or extreme dehydration due to vomiting or diarrhea with or without blood loss.

Responding to Anthrax Threats (Letters, Packages, etc.)

Physicians in the community should refrain from referring well patients to the Stanford Emergency Department for evaluation after an alleged biohazard exposure. They should follow the guidelines outlined by Santa Clara County.

In addition to the Santa Clara County Guidelines, the following protocol is recommended for dealing with a suspicious package or letter discovered at Stanford University Medical Center:

- Do not open the letter
- If the letter has already been opened and powder spills out, do not clean it up. Keep others away from the area.
- Place the letter in one plastic bag (use gloves and a mask if available).
- Immediately wash your hands with soap and water.
- Notify your supervisor, hospital security and local law enforcement officials (call 911).
- Page the Hospital Hazmat Team by calling Security and asking that the team be paged to your number. Hazmat Team members include: Per Schenk, Jim Schweikherd, and Mirna Citron. The direct pager is 16800
- Evacuate the area
- Ensure that all persons who have handled the letter wash their hands.
- Start a list of names and telephone numbers of all persons who have handled the letter.
- Place all clothing items worn when in contact with the letter into plastic bags
- Keep these bags with you, so that they are available for law enforcement officials

Stanford Emergency Department Response to Bioterrorism

There may be many "walking well" patients reporting to the emergency department requesting evaluation and treatment for suspected exposure to a biological agent. Determining which patients have truly been exposed to a biological agent will be a formidable task. Therefore the following guidelines have been instituted to standardize our approach until better screening and diagnostic modalities become available.

Please note: These recommendations are subject to rapid change as the situation evolves and County and State policies are modified.

Well (Asymptomatic) Patients Reporting to the Emergency Department

1) "Well" Patient(s) arriving to the emergency department (ED) by ambulance (or pre-announced) for evaluation after a potential biohazard exposure will be assessed in the

parking lot adjacent to the ambulance bay and, if necessary, decontaminated using established guidelines.

2) The security guard posted at the metal detector outside the ED waiting room will screen all patients requesting access to the ED to determine if they are seeking evaluation for a biohazard incident. Unannounced patients who are identified by this mechanism will be assessed by the ED Resource Nurse before the patient is allowed to enter the ED waiting room. Appropriate decontamination procedures will then be instituted if warranted by the situation.

3) In the event that decontamination is necessary, the ED will notify the Hospital Hazmat Team by calling Security and asking that the team be paged to the ED. Hazmat Team members include: Per Schenk, Jim Schweikherd, and Mirna Citron. The Direct pager is 16800. In most cases, patient decontamination will not be necessary for sick patients. The incubation period of biological agents makes it unlikely that victims of a bioterrorist event will become ill immediately following the exposure event. (see Decontamination of Patients and Environment)

4) The Palo Alto Fire Department HAZMAT Unit will be called by calling 911 if additional resources are needed.

5) Santa Clara County Health Department will be notified. The local health department has the lead role in the early detection and identification of a bioterrorist event. (408) 885-4214 (regular business hours) (408) 229-2501 (after hours and weekends)

6) If local law enforcement agencies have not been alerted to the event, then they should also be notified by the ED staff.

7) After decontamination (if indicated) the patient will be brought into triage, registered and given a medical screening exam like any other patient.

8) Unless we are notified otherwise by the County Health Department, nasal swabs or other cultures will NOT be collected to screen for anthrax or other biologic agents in asymptomatic patients.

9) Demographic and epidemiological information will be obtained on each patient to facilitate recontacting the patient after discharge from the ED.

Sick Patients Reporting to the Emergency Department

1) A sick patient reporting to the ED, who is suspected of suffering from anthrax or other bioterrorism agent, will be placed in isolation and standard personal protective precautions will be taken to reduce the risk of infection transmission.

2) The following individuals will be contacted immediately to facilitate management and to guide the evaluation, treatment and disposition of the patient

- a) Infectious Disease Fellow (and Attending in necessary)
- b) Infection Control Practitioner
- c) Santa Clara County Health Department
- d) Stanford University Biosafety Officer.

3) If at any time, the number of patients arriving to the emergency department (from a bioterrorism incident) exceeds the staff's ability to care for them with the resources available, a Code Zebra will be activated. (see below).

Code Zebra (Activation of the Hospital's Bioterrorism Emergency Preparedness Plan)

A "Code Zebra" is the activation of the hospital's bioterrorism emergency preparedness plan. Members of the Infection Control Committee, Infectious Disease Department (ID Fellow and Attending), Clinical Microbiology Laboratory, Stanford University Biosafety Officer, Admitting, Media Relations, Security, and Environmental Health and Safety will be paged and called by Stanford Operators, and instructed to report to Radiology East for mobilization. Radiology East has been designated as the staging area for the hospital manpower pool during a Code Zebra. The Administrator on Call will be paged and will report to and activate the Disaster Command Center.

The individual(s) activating a Code Zebra will subsequently contact the Santa Clara County Health Department, and the Palo Alto Fire Department Hazmat Team (911).

Members of the response team, in consultation with the County Health Agency and the ED Attending and Resource Nurse will determine what additional resources are needed and what action to pursue.

If necessary, a Code Triage (full activation of the Hospital Disaster Emergency Response Plan) will be initiated. This will be announced overhead as a "Code Triage."

Sick patients who are suspected of having Anthrax or other bioterrorism related infection, will have cultures and lab tests performed by our hospital lab under the guidelines outlined in the attached document titled: Specimens to Send to the Clinical Laboratory in Suspected Bioterrorism Agent Disease.

Decontamination of Patients and Environment

In most cases, patient decontamination will not be necessary for sick patients. The incubation period of biological agents makes it unlikely that ill victims of a bioterrorist event will present immediately following the exposure event. An exception may be an announced release of a bioterrorist agent, with gross surface contamination of victims with a confirmed agent or material. In the cases where decontamination may be warranted, simple washing with soap and water is sufficient. If necessary, environmental surfaces can be decontaminated with a U.S. Environmental Protection Agency (EPA) registered sporicidal disinfectant or with a 0.5% hypochlorite solution (1 part household

bleach added to 9 parts water). Bleach solution should NOT be used to decontaminate patients or pets.

Personal Decontamination will be done in accordance with existing Emergency Department Procedures and Stanford Hospital and Clinics and Lucile Packard Children's Hospital Hazardous Materials Response Program.

Update on Interdisciplinary Programs: Bio-X/Clark Center and Bioengineering

One of the most distinguishing and exciting developments at Stanford is the ever-increasing move toward interdisciplinary efforts in research and education. One of the most notable of these is Bio-X and the Clark Center. As noted in earlier communications, progress and transition epitomize the Clark Center at this juncture. The overall building design is complete and evidence of continued progress is visible nearly daily. During the next months, decisions regarding the specific programs and investigators who will become the first occupants of the Clark Center will also be determined. This awaits the selection of the next director of Bio-X/Clark Center and the approval of the cognizant Deans from the Schools of Humanities & Sciences, Engineering, and Medicine. The Vice Provost for Research and Provost are fully engaged in this next important phase of the selection process.

Together with the Selection of the next Director of the Clark Center/BioX, the subsequent goal is to determine the ideal grouping of a small number of thematic affinity groups or centers that will foster interactions within the Clark Center itself, attract faculty and students to the Center and engage in collaborations throughout the University. On Saturday, October 13th, the Deans heard wonderful presentations from faculty who have been engaged in potential project development for the Clark Center/Bio-X. It is anticipated that during the next weeks, additional proposals will be reviewed and the most promising and interactive centers selected. The transition from a focus on individual investigators to one that addresses the benefits of programmatic centers which serve as incubators, facilitators and collaborators offer the next important stage for the Clark Center and Bio-X. Exciting times are ahead.

In related but distinct efforts, I am pleased to inform you that continued progress is being made in our pursuit to develop a joint bioengineering program with the School of Engineering. Recognizing that discussions about this have been underway for a number of years, considerable progress has been accomplished within the past several months. Based on oversight meetings with the Deans of Engineering and Medicine, along with Drs. Jeff Kosoff from Engineering, and Drs. Paul Yock and James Nelson, from Medicine, efforts to develop a joint Department of Bioengineering are being considered. Further support for this concept has emerged from faculty retreats held by each School individually (with joint representation), each concluding that there is merit to proceeding to the development of a joint Department. A target date for concept approval has been set for late November. If we are successful in laying the correct groundwork, this could become the first joint department of bioengineering between a School of Engineering and

Medicine in the country. Not only would that be an important accomplishment in its own right but more importantly, it would foster a collaborative environment for undergraduate and graduate education as well as in interdisciplinary research. Indeed, the relationship between these joint efforts in bioengineering and the Clark Center/Bio-X should not go unnoticed.

Discussions with Medical Student Leadership Regarding Family Medicine

During the past several months there has been considerable discussion, debate and opinion regarding the status of Family Medicine at Stanford and, in particular, its role in medical student education. The debate was fueled by a decision I made, in May, to join the Divisions of Family and Community Medicine and General Internal Medicine, both of which resided in the Department of Internal Medicine. The goal was to create a larger critical mass of faculty that could further enhance the education of our students and promote new avenues for research. While the goal was, in my opinion, meritorious, the success to date has been less than what was hoped for or expected. I have also received an expression of concern from the Committee on Courses and Curriculum.

Accordingly, a discussion was held with Stanford Medical Student Association leaders and representatives on Thursday, October 18th, along with Dr. Julie Parsonnet, newly appointed Senior Associate Dean for Medical Student Education, Dr. Neil Gesundheit, Associate Dean for Medical Student Education, and Dr. Sam LeBaron, Associate Professor of Medicine (Family and Community Medicine) at Stanford University Medical Center.

In this meeting I underscored the School's commitment to sustaining and enhancing the highly valued and important clerkship in family medicine. It had been my hope that the newly defined merger could improve the already excellent clinical experiences offered to our students by family medicine faculty and staff. I also underscored that the perception that the merger "devalued" family medicine was not my intent. Although, I had been aware of the viewpoint that the overall academic development of family medicine had been limited by being a division, I also recognized that a departmental structure was not feasible at this time, especially given our current resource constraints. It was because of this that the concept arose for combining resources of family and general internal medicine in order to enhance the overall academic mission of both divisions. Although the newly merged division has been in place for several months, and while faculty and staff from both family medicine and general internal medicine are certainly seeking to do the best they can for our students, it is increasingly clear that both students as well as faculty, staff and community colleagues are less than satisfied with the current organizational structure.

Obviously, at such a juncture, the key question is whether continued efforts by faculty and students could make the current merged program work more successfully. Based on the input I have received, from a variety of sources, this seems unlikely. While my intent was never to offer the perception that one medical specialty (e.g., family medicine or

general internal medicine) was less valued than others, this seems to have occurred. I certainly apologize for that perception – it was not my intent. Accordingly, we will explore other options. However, the boundaries for these do not include a new department. Other alignments will be considered and, at its essence, we will do everything possible to assure the valued clinical elective provided by family medicine faculty and staff is sustained.

This is an interim report. Additional details will be provided as they unfold. During this process I hope to engage the continued cooperation and support of our faculty and students.

Executive Committee Update: Children's Health Initiative (CHI)

At the October 19th Executive Committee, Dr. Alan Krensky, Professor of Pediatrics and Director of CHI, gave a presentation of the history, current status and future expectations of the CHI. He noted that in November, CHI will be officially announced in conjunction with the 10th Anniversary Celebration of the founding of the Lucile Salter Packard Children's Hospital (LPCCH). The goal of the presentation was to inform the Executive Committee members about what CHI is and it is not – especially given the multiple phases of its history and evolution.

Because the official announcements about CHI will be part of the 10-year celebration of LPCCH now scheduled for November 15th (having been rescheduled from the originally dates due to the tragic events of September 11th), I will only provide a very truncated description at this time. The fundamental message, of course, is that CHI represents an extraordinary opportunity for LPCCH and Stanford Pediatrics to achieve enormous prominence and sustainability during the next decade and beyond in child health and pediatric research. This is due to the remarkably generous gift of the Packard foundation, that when completed, will provide approximately \$500 million during the next 10 years to develop outstanding programs in clinical care, research and education as well as facilities at LPCCH and Stanford. This mandates enormous stewardship by the leadership of CHI, LPCCH, the School of Medicine and the Foundations providing this exceptional support.

At the same time, it is also essential to manage the expectations surrounding the timelines of the CHI effort. Although it is important to underscore that although the ultimate \$500 million gift and grant for CHI is due to a combination of direct gift support from the Packard Foundation coupled with a matched fundraising effort, it is critical to make clear that these funds do not, at the moment, exist in the aggregate. That is because of the matching support fundraising effort that will be carried out by the Lucile Packard Foundation for Children's Health which will complement the gift provided by the David and Lucile Packard Foundation to LPCCH for the CHI. It is anticipated that with the successful matching, the yearly funding that will be available for program development will be approximately \$30 million per year, a large portion of which will be allocated as endowment support for specific program areas. This further means that while a number of important opportunities have already been identified, the timeline to achieve them will

be measured in years and will surely be influenced by areas of opportunity. Thus, while a long-range plan has been developed and will be constantly refined, it is important to recognize that the ultimate fulfillment of this plan will unfold gradually during the decade ahead. Nonetheless, this represents an unparalleled opportunity to develop a pediatric program of enormous importance and that will serve our community, LPCH, Stanford and the world, if done with the excellence and care that must now occur. Accordingly, it is important to engage the critical acumen, knowledge and commitment of our faculty leaders – both those already focused on child health and those whose expertise and knowledge from other disciplines can help the CHI effort to be as successful as it can possibly become.

Needless to say, more details will follow on this very important topic and initiative.

Meetings and Gatherings

Cardiothoracic Surgery Faculty Meeting. On Monday, October 11th I had the pleasure to participate in the CT Surgery Faculty meeting. I want to thank Dr. Bruce Reitz for inviting me to attend the meeting and for the faculty who raised important questions regarding the projected clinical strategic initiatives that have been established for CVS, the impact of the recruitment of pediatric CT surgeons, the role of the Operating Room Director, and the overall financial performance of the department and the hospital.

Boston “On the Road” Event. On Tuesday evening, October 23rd, I had the opportunity to address Stanford Medical Alumni living in Boston and the greater New England area. This was the third such annual event sponsored by the Office of Alumni Relations and hosted by Dr. Ross Bright, Associate Dean for Alumni Affairs. The event provided an opportunity to meet with recent as well as past Stanford graduates and to inform them of the changes occurring at the Medical School and Medical Center. I shared the current outlines of our now ongoing strategic planning efforts and how this will impact on new program development and our Stanford Medicine Capital Campaign in the second half of 2002.

Special thanks to the Office of Development and Alumni Relations, especially Kaleo Waxman, Charlie Brown and Andrew Cope, for making the evening so successful.

Pediatric Drug Testing

A sad reality during the past decades has been the inadequate development of drugs for infants and children. Indeed, through the present, nearly 80% of drugs currently in use have had no testing in children. This had significant negative consequences during the early AIDS era but also has negatively impacted the ability to adequately develop new agents for numerous other pediatric illnesses. Because of this, a number of groups and foundations have worked to improve drug availability and clinical research in children.

This had a major impact in 1997 through the FDA Modernization Act. However, the past year has witnessed some pushback on pediatric clinical research in the lay press in general and the resultant real possibility that the current program which provides incentives to the pharmaceutical industry to permit drug testing in children might not be approved. The consequences for pediatric clinical research should that happen would be enormous. I am pleased to say that a number of individuals at Stanford and LPCH are helping to prevent that from occurring. Dr. Charles Prober, Professor of Pediatrics and Scientific Director of the Glaser Pediatric Research Network and Dr. Harvey Cohen, Professor and Chair of the Department of Pediatrics have been particularly important in advocating for approval of the bill to sustain incentives for pediatric drug testing. I have worked with Drs. Prober and Cohen along with the Elizabeth Glaser Pediatric AIDS Foundation and the Health Policy Board of the Institute of Medicine to advocate for the passage of the bill. I am happy to say that this past week the US Senate passed the pediatric testing bill that extends the highly successful incentives for testing of drugs for use in children. Senate passage is a big victory for kids, but the job is not done. The next steps will be to pass the bill in the House, reconcile the House and Senate bills, and then send the bill to the President for his signature.

Depending on the next steps we may wish to call on your advocacy as well.

Congratulations

Philip Sunshine, M.D.: On Sunday, October 21, 2001, Dr. Phil Sunshine, Professor of Pediatrics, received the Virginia Apgar Award from the Section on Perinatal Pediatrics of the American Academy of Pediatrics. One of the founding fathers of neonatology, Dr. Sunshine has made significant and enduring contributions to science in addition to being an outstanding clinical neonatologist and teacher. He was, for example, the first to describe the relationship of neonatal thyrotoxicosis to the long-acting thyroid stimulator that was subsequently shown to be thyroid-stimulating immunoglobulin. He has been a pioneer in the early study of mechanical ventilation and its impact in the treatment respiratory distress syndrome. His background in biochemistry also led him to contribute new knowledge to the study of metabolic diseases of neonates, including the first description of a child with ornithine transcarbamylase (OCT) deficiency. Equally importantly, Dr. Sunshine has been a wonderful educator and a national leader in pediatrics, serving in numerous leadership roles. Perhaps most importantly, he is deeply admired by his colleagues and students for his integrity, commitment and humanity.

Congratulations to Dr. Phil Sunshine.

Halstead R. Holman, M.D.: The American College of Rheumatology has bestowed its highest honor, the Presidential Gold Medal, upon Hal Holman, the Berthold and Belle N. Guggenheimer Professor of Medicine. Given once each year, this award recognizes the individual, who in the opinion of the College has demonstrated a career-long mark of excellence to research, clinical work, and

teaching in medicine and rheumatology. Dr. Holman's career, which now spans nearly 50 years, includes the initial studies of role of anti-nuclear antibodies in rheumatologic diseases. The award also recognizes Dr. Holman's leadership in the development of a scientifically excellent faculty in the early development of the Department of Medicine when the School first moved from San Francisco to Palo Alto in the early 1960s. He is also acknowledged for his teaching abilities, clinical excellence and commitment to the care of adults with chronic disease.

Congratulations to Dr. Hal Holman.

David B. McKay, M.D., Ph.D.: Professor of Structural Biology, has been elected a Fellow of the American Association for the Advancement of Sciences for his crystallographic and biophysical studies that have provided insights in macromolecular structures and mechanisms of microbial virulence factors, molecular chaperone proteins, and catalytic RNAs. He joins 28 other Stanford faculty who have been elected Fellows of AAAS in recognition of their scientific contributions.

Congratulations to Dr. David McKay

Appointments and Promotions

Bishr Omary has been promoted to Professor of Medicine (Gastroenterology/Hepatology), effective 10/1/01

Congratulations to Dr. Omary

Dean's Newsletter November 12, 2001

Town Hall Meeting on Monday November 19th

Faculty, staff and students are invited to attend a Town Hall Meeting on Monday, November 19th at Noon in the Fairchild Auditorium. The purpose of the Town Hall meeting will be to give you an update on the Strategic Planning Process now underway for the School of Medicine. This will be the first of three Town Hall Meetings, the others scheduled for Monday January 14th and Monday February 25th will also be at Noon in the Fairchild Auditorium.

In the September 17th issue of the Newsletter

(http://deansnewsletter.stanford.edu/archive/09_17_01.html#5) I announced the initiation of the comprehensive School-wide Strategic Planning that is now underway. At the Town Hall Meeting on November 19th I will outline the process we are following and engage your ideas and suggestions. I hope you will attend.

At the January 14th Town Hall Meeting we will plan to report some of the work that has been accomplished to date and that will be presented at the Strategic Planning Retreat scheduled for February 8-10th. We will then hold a third Town Hall Meeting on February 25th to inform you of what was accomplished at the Retreat. It is my hope that these Town Hall Meetings will provide an additional forum for discussion and an opportunity for members of our community to share their views and suggestions.

Emergency Preparedness

The past two months have necessitated that all members of our Medical Center and University community become engaged in emergency preparedness. This is a process that is occurring across the USA and likely in other parts of the world as well. While our attention had been directed at bioterrorism, bomb threats and other acts of terrorism and violence, it is also important not to lose sight of the importance of preparedness for natural disasters, such as earthquakes, fires, etc.

On Wednesday October 31st, University Officers and Leadership staff took part in an emergency preparedness exercise dealing with an earthquake scenario. Important issues of alignment between University student health services and the Medical Center were reviewed along with issues surrounding the protection of students and employees as well as families residing on campus. The session provided an opportunity to identify important issues that will make the university safer and more able to respond to a natural disaster.

Of course most of our attention at the Medical Center in the past eight weeks has been focused on terrorism. Not surprisingly, our initial organization and response efforts were not as well established as should be. That has changed. In the last several weeks a Bioterrorism Task Force

(<http://www.stanfordhospital.com/forPhysiciansOthers/bioterrorism/index.html>) has been established (see October 29th Newsletter -

http://deansnewsletter.stanford.edu/archive/10_29_01.html#1). Moreover, our Medical School Emergency Management Team, including Mr. David Silberman and Mr. Keith Perry, have visited with every Department Chair and DFA to assure that each department understands the procedures that should be followed in a Emergency. It is just as important for every student, staff and faculty member to be knowledgeable about emergency preparedness. Everyone should carry the plastic card that lists the "Stanford University School of Medicine Emergency Instructions". If you don't have an Emergency Instruction card please check with your departmental DFA or supervisor. Everyone should also know the "Emergency Hotline Numbers" for the School: 723-7233 (or 7BE SAFE).

One practical issue is that some of the guidelines for the University and the Hospitals differ. Specifically, University and Medical School guidelines may call for building evacuation during an emergency. In contrast, Hospital guidelines do not call for general evacuation since these buildings are specially constructed to withstand natural disasters and, of course, contain patients who require continued care. However, there are some

Medical Center buildings that are commonly inhabited by both University and Hospital personnel, raising the question of which rules (e.g., evacuation or not) should apply. Based on this, Mr. Silberman instructed staff that everyone one in the Boswell building and north of the Core should follow the Hospital procedures, "protect in place" and not evacuate. Others should follow the university policies and everyone should know where their emergency assembly point is located. Only clinical faculty or staff who have been specifically instructed to be in the Hospital should be in attendance during a Hospital emergency.

Although we all hope that no serious events will occur, it is essential that every member of our Medical Center community be informed and prepared.

Student Safety on Campus

In addition to the important attention to Emergency Preparedness as noted above, I would be remiss in not commenting on another issue that concerns me greatly regarding student safety. This is the striking paucity of bicycle lights and nearly complete absence of helmets by the many students who ride the campus, especially during the evening hours. When coupled with the inattention to stop signs and lack of conventional hand turn signals, this can only be described as another disaster in the offing. I have raised my concern regarding bicycle safety on campus at the University Cabinet meeting on November 8th.

While we should be proud of a Campus that is attempting to reduce automobile traffic and which encourages students to use bicycles as the predominant mode of transportation, we should also insist that safety be ensured. At a minimum, bicycle lights and reflectors should be required. I also believe that bicycle helmets should be worn on campus.

Update on "Funds Flow"

In the May 29th Issue of the Newsletter

(http://deansnewsletter.stanford.edu/archive/05_29_01.html#1), I reviewed the fundamentals of "funds flow" or payments to clinical faculty by Stanford Hospital & Clinics and the Lucile Packard Children's Hospital for services rendered. These include support for medical direction, "essential services", payments for fellows, and clinical program development. Many of these payments have evolved over the years and have been based on changing criteria or expectations. While these payments for services rendered are extremely important, they have also been a source of contention, confusion and debate by faculty, hospital administration and members of the Board of Directors. Accordingly, for some months efforts have been underway to bring greater clarity, rationale and transparency to the flow of these funds including their source and use.

Based on the work of Drs. Norm Rizk, Senior Associate Dean for Clinical Affairs, Gary Glazer, Chair of the Department of Radiology, together with other faculty, hospital administration and School of Medicine leadership, proposals were developed for

addressing both hospital payments for services rendered by clinical faculty as well as a School of Medicine incentive plan for clinical departments. The products of these deliberations, based on final executive decisions rendered by the Dean, were reviewed and modeled and then presented to the Internal Governing Council on Friday, November 9th.

Although budgets for the clinical departments for FY02 had been set on September 1st, we agreed in late August that the work of the Advisory Group on payments for services rendered and incentives would result in modifications of these budgets retroactive to the beginning of this fiscal year. Those data were shared with the department chairs and DFAs at the Governing Council meeting. This remains a work in progress and additional scrutiny will be needed during the months ahead. While this work will refine the application of principles used to determine these payments from the hospital to the clinical departments, the numbers for FY02, based on the data shared on November 9th are now set for the year. It should be noted that this analysis was purposefully restricted to SHC for FY02. It is expected that the same principles will apply to both SHC and LPCH for FY03 and beyond.

The goal is to assure that the payments for services and related expenses between the Hospitals and the School are based on sound principles, are as fair as possible, are transparent and have some reasonable predictability. It is recognized that the incentive payments can fluctuate based on performance.

It is also important for me to point out that an important principle is to assure that, as much as possible, we are all working to achieve common goals and objectives. Although the financial strains of our academic medical center can easily draw fracture lines and quickly erode in acrimony and protest, we are best served when the decisions regarding payments are understandable, transparent and performance based. This was especially notable during FY01 when the payments for clinical services from the Hospitals were reduced by approximately 25%. Although it is recognized that the poor financial performance, especially of SHC, mandated a number of cost reductions, it must be underscored that they were not based on clearly defined principles and, moreover, the amount of the reduction appeared arbitrary. Thus, an important feature of our recent efforts was to provide greater clarity and rationalization for this process. We still have work to do to achieve these goals and principles, but the information and decisions presented on November 9th are an important step in the right direction.

The analysis of payments for services rendered is but one of a series of important issues under active review. The principles guiding faculty compensation, physician practice and organization, department reserves, and funds flowing between the Dean's office, basic and clinical departments and the Hospitals, all require additional scrutiny and refinement. A number of these reviews are underway and some will be included in the planning for the School-wide Strategic Planning Analysis.

It should also be noted that in recognition of the significant reduction of funds from the Hospital in FY01 and FY02, the School of Medicine helped create the incentive payment

pool. This was done with funds already accrued from clinical faculty and that was thus returned to the departments as well as from other School reserve accounts. While this helps to stimulate the incentive pool for FY02, other sources will need to be found for FY03 and beyond. The sources for these funds will include additional hospital payments as well as re-basing the currently extant allocations to areas no longer deemed necessary. Obviously, this work in progress will be ongoing through the remainder of the fiscal year.

Additional Updates from the Governing Council

At the Governing Council on November 9th, we also heard some additional good news and bad news. The bad news is that according to the Pacific Business Group survey clinical services provided by SHC have fallen from their lofty #2 place to a lower ranking. This is obviously of concern and will receive considerable attention and work by Hospital administration and clinical faculty.

At the same time, there was good news regarding the volume numbers at SHC for October, showing that patients are coming to Stanford in greater than expected numbers to receive care. This is clearly important. In addition, Dr. Paul Ford, General Internal Medicine, presented the important quality improvement results by Stanford primary care physicians to reduce appointment times to one-day service. During the last six months they have made major strides and have achieved their goal, which is already resulting in improved patient/consumer satisfaction. I want to congratulate Dr. Ford and his colleagues for initiating and completing this important initiative. It will be important to learn from this experience and determine how to apply it to other clinical areas.

More Progress in Bioengineering

This past week we achieved another milestone in our efforts to develop a joint department of bioengineering with the Schools of Engineering and Medicine. Our leadership group consisting of Drs. Pizzo, Plummer, Koseff, Nelson and Yock met on November 7th. Based on the recent planning meetings held by both the Schools of Engineering and Medicine there was great interest in now proceeding to the actual development of this joint SoE/SoM Department. We agreed that we would strive to make this a joint effort in every way possible and, equally importantly, that we would not let the understandably inevitable road blocks we will surely encounter stand in the way of progress.

The next steps will include the formation of four subcommittees that will focus respectively on undergraduate education, graduate education, academic governance and finance & administration. We expect to name the co-chairs of these committees by the end of this calendar year. Having reached this important milestone, we agreed that the Deans would meet jointly with the President and the Provost to review the progress made and future planning. In addition, a Steering Committee will be formed to oversee the next stages of planning. Finally, we plan to complete the work of the above mentioned subgroups by the end of this academic year.

This is wonderful news.

Compliance Committee

On Wednesday November 7th we held the first meeting of our School of Medicine Compliance Committee. This Committee is chaired by the Dean and brings together Senior Deans and Legal Counsel to provide a comprehensive and effective oversight of compliance-related activity within the School. The Committee will be aligned to the University Compliance Committee and assure that important issues affecting the School of Medicine and Medical Center are reviewed and addressed. The Committee will not supplant or interfere with the work done by the compliance committees surrounding education, research, patient care but will attempt to assure that the interrelationships surrounding some of these areas are addressed and that the School leadership is both aware and responsive to individual faculty and institutional compliance.

Medical Students visit with the Surgeon General

During his recent two-day visit to Stanford University, Dr. David Satcher, U.S. Surgeon General counted as one of his highlights the opportunity to meet with students. On Monday, November 5th, Dean Sharon Long arranged for a meeting with undergraduate students in Humanities & Sciences. On Tuesday, November 6th, the Medical School had the pleasure of hosting Dr. Satcher and he held a lunch meeting with some of our medical student leaders. I had the pleasure of joining that group and share Dr. Satcher's enthusiasm and appreciation.

I want to thank the medical students who attended the luncheon, including Anna Battat, Nirav Rati Bhakta, Duane Campbell, Phil Ecker, Vivek Jain, Charay Jennings, Isabel Demos Lee, Rosalyn Nguyen and Elizabeth Rogers. Each presented some of their areas of community service and leadership and discussed with Dr. Satcher how important these activities were to them and to the communities they serve.

Stanford Medical School Mentoring Program.

I received the following message from Nicole D. Marsico, SMS II regarding the Stanford Medical School Mentoring Program that is of interest. According to Ms. Marsico:

"The program consists of a web site (<http://medapps.stanford.edu/mentors>) put together by students featuring nearly 200 volunteer mentors from the Stanford faculty and surrounding community. The mentors were recruited by the hard work of faculty such as Dr. Bill Mobley (Chair, Department of Neurology) as well as the Alumni Association and the Santa Clara County Medical Association and represent a broad range of interests. We introduced the program to the students in October and have thus far matched nearly 70 students... The student response has been extremely enthusiastic; I've received many encouraging

comments from both pre-clinical and clinical students. To help launch this program, we've planned a kick-off event for sometime in February."

Awards

In the October 29th Issue of the Newsletter I announced Dr. David McKay's election as a Fellow in the American Association for the Advancement of Sciences. I am pleased to announce that two other School of Medicine faculty have also been elected Fellows to AAAS. They are:

James A. Spudich, the Douglass M. and Nola Leishman Professor of Cardiovascular Disease, was cited "for major contributions to the understanding of cell motility and development of in vitro methods for measurements of molecular motors."

Lucy S. Tompkins, Professor of Medicine (Infectious Diseases and Geographic Medicine) and of Microbiology and Immunology, was cited "for fundamental studies on bacterial pathogenesis."

Congratulations to Drs. Spudich and Tompkins.

Appointments and Promotions

Dr. Larry Moss has been promoted to Associate Professor of Surgery (Pediatric Surgery) at Lucile Packard Children's Hospital

Dr. Ginna Laport has been appointed Assistant Professor of Medicine (Bone Marrow Transplantation) at Stanford University Medical Center.

Dr. Robert Lowsky has been appointed Assistant Professor of Medicine (Bone Marrow Transplantation) at Stanford University Medical Center

Dr. Stephen Skirboll has been appointed to Assistant Professor of Neurosurgery at Stanford University medical Center

Dr. Margo Thienemann has been appointed Assistant Professor in the Department of Psychiatry and Behavioral Medicine at Stanford University Medical Center.

Jay Bhattacharya has been appointed Assistant Professor of Medicine (Primary Care and Outcomes Research

Seung Kim has been reappointed Assistant Professor of Developmental Biology and, by courtesy, of Medicine, 11/01/01-10/31/05

Congratulations to all.

Dean's Newsletter

November 26, 2001

Town Hall Meeting on School of Medicine Strategic Plan

On Monday November 19th the first of three Town Meetings was held to engage faculty, students and staff in our School of Medicine Strategic Planning efforts. This first meeting, held in the Fairchild Auditorium, reviewed the mission-driven interrelated planning effort now underway. Under the guidance of a Senior Associate Dean, seven work groups have been meeting to review the School's missions and goals, along with its strengths, weaknesses, opportunities and challenges in fulfilling them. The current work groups include medical education, graduate and post-doctoral education, research, clinical affairs, the academic professoriate, finance & administration, and advocacy, public policy and philanthropy. One other work group, "information technology", has yet to meet since we are finalizing plans for how to construct leadership for this very important area (see below).

In addition to providing an update on the current status of the Strategic Planning efforts, I encouraged those in attendance to share their views and visions for the School with me, other Senior Deans as well as the Strategic Planning Coordinator, Mr. Dave O'Brien. As you know, we will be reviewing the products of our 7-8 Working Groups at an Executive Retreat in February and, following that, we will develop our prioritized list of major initiatives for the next several years. During the next weeks I will be sharing some of the preliminary recommendations from the Working Groups in the Newsletter. I hope you will use those communications as an opportunity to share your reactions or alternate recommendations. Recognizing that in the end we will need to make a limited number of choices we can work on, I do want to engage as much input and feedback from you as possible during this phase of the planning process.

A common theme of my presentation was the role of Stanford School of Medicine as a leader in interdisciplinary education and research. It is our hope that new and novel collaborations and interactions will help us improve patient care and thus engage our community, locally, nationally and globally, in better valuing the role of academic medicine in general and Stanford in particular. This perspective was reaffirmed by comments we received following the Town Meeting.

10th Anniversary Celebration of the Lucile Packard Children's Hospital

On Thursday evening, November 15th, The Lucile Salter Packard Children's Hospital officially celebrated its 10th year anniversary. This event was coupled with the wonderful announcement that the David and Lucile Packard Foundation was committed to help assure the pre-eminence and sustainability of the Packard Children's Hospital. This will be accomplished through the combination of a \$100 million gift and a commitment to

match an additional \$200 million raised from communities locally and nationally. The resultant \$500 million that would become available during the next decade would help Packard Children's Hospital and Stanford develop "Centers of Excellence" in such important areas as Brain & Behavior, Cardiovascular Disorders, Pulmonary Disease (including Cystic Fibrosis), Tissue Engineering and Organ Transplantation, and Cancer Biology and Treatment. In addition, the Johnson Center for Obstetrics and Newborn Medicine will continue to help improve the lives of high-risk neonates and infants. These are areas where significant progress is anticipated in the next decades. The role of children's hospitals in improving disease outcome has been significant and it is anticipated that the Lucile Packard Children's Hospital, which has already emerged as one of the nation's finest, will become a leader and innovator in the years ahead.

The first children's hospitals in the USA were founded in the 1860s, and included those in Philadelphia, Chicago and Boston. During the past 140 years, children's hospitals have made major contributions to the care and well being of children. A number of the diseases that took the lives of children in the 19th and 20th centuries are now preventable or curable. Others have moved from the fatal or highly morbid category to either treatable or controllable. Unfortunately, children are still vulnerable to a number of life-threatening illnesses - either congenital or acquired. These are the focus of activity in the leading children's hospitals.

In my opinion, the best children's hospitals are defined by two essential facets. The first is a focused attention on the care and well being of children and families, including child and family centered facilities, and committed staff to reduce the fear and pain associated with new or chronic illness. The second important characteristic of leading children's hospitals is to improve the lives of children by state-of-the-art care coupled with a constant commitment to improve it further through research. A children's hospital without a strong research and education commitment is unlikely to sustain excellence over time because it will lack the ability to be innovative and bring new knowledge to the care of infants, children and adolescents.

During the next 10-20 years I believe that Packard will become one of the nation's leading children's hospitals. Several factors will contribute to this. The first is the excellence of the current staff and leaders, and their commitment to doing the very best that can be done for children and families. The second factor includes the physical resources available for the care of children and families, including the plans to expand and improve them. The third and perhaps one of the most important factors is the proximity and connectivity to Stanford University School of Medicine and Stanford Hospital. This creates an extraordinary amplification effect. Indeed, the interactions of Packard pediatricians and scientists with outstanding basic and clinical science investigators at Stanford will enable research to more rapidly disseminate to the children being treated at Packard. Equally importantly, as the School of Medicine increasingly engages the expertise and knowledge of the broader university, including faculty in engineering, humanities & science, laws, education, business, the prospect for developing unique solutions for the medical and social problems impacting children become even greater. Conversely, without the proximity and interactions of Packard with Stanford, the

children's hospital alone would be unlikely to achieve national excellence. Thus, having Packard Hospital both focused on children but also closely intertwined with the School of Medicine and the university creates an environment and breadth of resources that is nonpareil. It will serve to distinguish Packard Hospital from all other children's hospitals.

Naturally, accomplishing the goals outlined above requires support and commitment. Accordingly, the extraordinary gift and grant from the David & Lucile Packard Foundation and, in addition the support of the community, will enable Packard Children's Hospital and Stanford to achieve the pre-eminence and excellence it can and must. This is not only important for those children who come to Packard Children's Hospital for care, but also for children worldwide who will benefit from the discoveries and innovations that are made here, and from the trainees who will leave Packard/Stanford to help children and families around the world.

Executive Committee: Review of Informatics and Information Technology

At recent Senior Dean's meetings and the Executive Committee meeting on Friday, November 16th, we reviewed the current and future challenges and opportunities for the School of Medicine in informatics and information technology. Drs. Mark Musen, Associate Professor of Medicine (General Internal Medicine) and, by courtesy, of Computer Science, and Parvarti Dev, Director of SUMMIT, reviewed the range of disciplines that come under the broad umbrella of informatics/information technology. They also discussed the specific direction that the School might take in helping to optimize its impact on programs in education, research and clinical care.

It is important to underscore that the range of informatics/information technology extends from the basic science concerned with the study and management of information (i.e., informatics) to the use of computer technology to support faculty, student and staff productivity in education, research, clinical care (i.e., "information technology"). Within this spectrum from basic to applied, are the exciting fields of computational biology and clinical computing.

Recognizing that there are areas of great strength in informatics and biocomputation already extant at Stanford, it is also important to note that these are currently located in different Schools and Departments. A unifying home or center, which could be School-based or, more ideally, inter-School structured, will be important in assuring that Stanford optimizes its academic program in informatics and biocomputation. Because the Schools of Medicine, Engineering, Humanities and Sciences, each have significant interests in this rapidly evolving area, it is likely that the most optimal solution will emerge from an interdisciplinary program.

In tandem with a need to develop an organization that helps to organize informatics is a need to stimulate and improve information technology and integrated information management within the School of Medicine. This would seem to be best organized through the creation of a new position, namely a Senior Associate Dean for Information Technology. This office would stimulate and enhance the use of information technology

in education and learning (including library services), in research and, importantly, in the interface with hospital-based clinical information systems.

Based on the reviews that we have conducted during the recent months, it is now clear that a stronger coordination of information technology is important to optimize learning, information and research programs within the School and Medical Center. Accordingly, we will be proceeding to search for an individual to fill a new position as Senior Associate Dean for Information Technology and Integrated Information Management.

Any thoughts or suggestions you have regarding this will be appreciated.

Radiology Department Faculty Meeting

On Tuesday November 13th I had the opportunity to attend a Department of Radiology faculty meeting where Dr. Gary Glazer, Professor and Chair of the Department of Radiology, along with other departmental leaders, reviewed recent past accomplishments and future plans for the education, research and clinical programs. It is clear that during the past decade Dr. Glazer and his colleagues have developed an academic department that stands among the very finest in the nation. The academic achievements in research and education are coupled with significant technologic advances to improve patient diagnosis. However, these advances are also associated with significant challenges in the need for new state-of-the-art capital equipment, as well as additional space and workforce requirements. These have been aggravated by the recent and current financial challenges faced by Stanford Hospital & Clinics in particular. The solutions will require active participation by the Department, School and Hospitals and will surely necessitate new creative approaches and shared ventures. The impact however can be enormous and, therefore, must be pursued. Further details will follow.

Thanks again to Dr. Glazer and the Radiology Department for past performance and future promise.

Roy B. Cohn-Theodore A. Falasco Professorship

On Tuesday evening, November 13th, a reception was held in the Iris & B. Gerald Cantor Center for the Visual Arts to announce and celebrate the creation of the Roy B. Cohn – Theodore A. Falasco Professorship in Cardiothoracic Surgery at Stanford University School of Medicine. The first incumbent of this new Professorship is Philip E. Oyer, MD, PhD, currently Professor of Cardiothoracic Surgery

The official ceremony included remarks from Dr. Bruce Reitz, Professor and Chair of the Department of Cardiothoracic Surgery and Dr. Norman Shumway, Frances and Charles Field Professor of Cardiovascular Surgery, Emeritus. I also spoke on behalf of the School and University about the vital importance of endowed chairs to the support of faculty and the future enrichment and success of the School of Medicine and Stanford University

The Roy B. Cohn Professorship is being created through the generosity of Mr. Ted Falasco and his family. Mr. Falasco is a Stanford alumnus and successful business and

community leader in Los Banos, California. His wonderful contribution honors Dr. Roy B. Cohn who treated his daughters Susan and Linda some 35 years ago. Dr. Roy Cohn, who died on January 11, 1999 at the age of 89 was a “one of the last of the old-time classical professors of surgery” at Stanford. As described by Dr. Shumway “Roy Cohn was unique, one of a kind, singular, and brilliant. There was never anyone quite like him. He was energetic to overflowing. He was funny and fun loving. But most of all he was THE professor to us, his colleagues.” Mrs. Cohn and members of the Cohn family, along with members of the Falasco family attended the ceremony.

It is fitting that Dr. Phil Oyer is named the first Roy B. Cohn – Theodore A. Falasco Professor. Professor Oyer is an outstanding cardiovascular surgeon and a pioneer in developing innovative approaches to difficult surgical procedures. Professor Oyer’s research has focused on the development of left ventricular assist devices an area in which he is a highly recognized leader. In addition to his skills as a surgeon and investigator, Dr. Oyer was also one of the very last residents to train under Dr. Roy B. Cohn, making this both a personal and professional tribute.

I want to thank the Falasco family for their enormous generosity in establishing the Roy B. Cohn Professorship to honor a highly regarded member of the Stanford Medical Community. I also want to congratulate Dr. Phil Oyer for being selected as the first holder of the Roy B. Cohn – Theodore A. Falasco Professorship.

Dean’s Staff Annual Recognition Banquet

On Wednesday evening, November 14th, the Annual Recognition Dinner was held to honor the staff of the School of Medicine who have served for 5, 10, 15, 20, 25 and 30 years. There is little question that Stanford’s leadership in academic medicine is directly related to the excellence of its faculty, staff and students. We are privileged to have an outstanding group of dedicated individuals who work diligently and with great commitment to assure that our missions in education, research and patient care are outstanding. Without the work and toil of the many hundreds of individuals who make our finance, administration, research, education and patient service operations function as optimally as they do, we would not be able to achieve the success that currently abounds at Stanford School of Medicine. We are fortunate to have a superb staff that provides the connective tissue in a medical school family of excellence. It is fitting to honor those who have sustained their work and dedication over the years and I felt privilege, as a newcomer, to be among this distinguished group.

We also had the opportunity to announce the winners of the new **"SPIRIT Award"**. This award recognizes two School of Medicine staff members who best epitomize the SPIRIT (Service Orientation, Positive attitude, Initiative, Resourcefulness/reliability, Innovation, and contributing as a Team Player) of Stanford. This new award will be given annually. The first two recipients of this year's Spirit Award are Catharine Booth, Lab Manager for the Department of Molecular and Cellular Physiology, and Greta Lazaro, Personnel Coordinator for the Human Resource Group. Catharine and Greta have served the School of Medicine and Stanford with many years of dedicated and

outstanding service and have portrayed the true “SPIRIT of Stanford University School of Medicine.

In addition to congratulating Catharine Booth and Greta Lazaro, as well as all those who have committed years of service to the School of Medicine, let me take this opportunity to thank each and every member of our community. Now, perhaps more than ever, it is important and appropriate to acknowledge the important role that each of you play in helping to make Stanford a vibrant environment that values its missions in education, research and patient care – as well as the individuals who help make them successful.

Congratulations to Dr. Stanley Schrier.

It is a pleasure to announce that Dr. Stan Schrier, Professor of Medicine (Hematology), Emeritus, has been elected President of the American Society of Hematology for 2004. This is the largest and most prestigious society for hematology in the world and Dr. Schrier’s election as President signals the esteem in which he is held by colleagues throughout the USA.

Congratulations to Stan Schrier.

Appointments and Promotions

I am pleased to announce that **Robert C. Robbins** has been promoted to Associate Professor of Cardiothoracic Surgery, with tenure, effective November 1, 2001

Congratulations to Dr. Robbins.

Dean’s Newsletter December 10, 2001

Happy Holidays

As December unfolds, the season for both religious and secular holidays begins in earnest. I want to take this opportunity to wish you and your families a very Happy Holiday Season and a Happy New Year. Without question, nearly every one of our year-end reflections will be cast against the large shadow emanating from the tragic events of September 11th. However, this also provides an opportunity to also reflect on what is most important: our family, friends, colleagues, freedom and ability to do good on behalf of our communities, locally, nationally and globally.

Executive Committee Update on the Retreat – Mission Statement and Next Steps

At the Executive Committee Meeting on Friday December 7th, David O’Brien, who is coordinating the efforts of the eight Strategic Planning Work Groups, reviewed the

progress to date, which I am pleased to say has been quite notable. Each of the Strategic Planning Work Groups have focused on the overall School-Wide Mission Statement, have addressed their specific mission statement, as well as functional goals and an analysis of the Strengths, Weaknesses, Opportunities and Threats in each of their respective areas. With this, the Groups are now compiling their mission-specific inventories and priorities. During January, the inventories and priorities will be completed and an analysis of the impact of one mission on another will be assessed, along with programmatic and capital resource needs required to achieve the success of the medical school and medical center.

Based on the input from the various Strategic Planning Work Groups, which represent a cross section of our faculty, students and staff, the initial draft mission statement that has been previously published and circulated has been modified to the following draft mission statement for the Stanford University School of Medicine:

We are a premier research-intensive school of medicine that improves health through our discoveries, leadership and innovation in education, patient care, and biomedical and clinical research.

Because how we carry out our work and what we become derives from our vision, it is important that our School's mission statement be reflective of that vision and be understood and shared by all members of our community. It is also important that our mission statement be agreed to before our retreat in February so that our efforts then, and in the months that follow, are clearly defined, and as optimally implemented as possible. Accordingly, I would welcome any comments or suggestions from you regarding the revised mission statement shown above.

In addition to the continuing efforts and interactions of the Strategic Planning Work Groups noted above, we are planning the following additional pre-retreat presentations:

1. School of Medicine Executive Committee meetings on January 4, 18 and February 1st.
2. School of Medicine Faculty Senate on December 19th and January 14th, concentrating on education.
3. Town Hall Meeting at Noon on January 14th in the Fairchild Auditorium, to which all faculty, students and staff are invited.

Following the Retreat during the weekend of February 8-10th, which should be viewed as a beginning rather than an ending, we will collate and prioritize our major initiatives, define their scopes and the resources necessary to achieve them. Throughout this process I am eager to enlist input and suggestions from any whom wish to offer them. Please respond to the Dean's Newsletter email box or feel free to contact any of our Senior Associate Deans directly to offer your suggestions and recommendations. It is our intent and hope that we can make this as inclusive a process as possible.

Farewell to Dr. Gene and Gloria Bauer

On Tuesday, November 27th, University Officials and Trustees were joined by faculty and staff of the School of Medicine to bid a fond farewell to Gene and Gloria Bauer for the wonderful service they provided to Stanford University during the past 13 years. I was pleased to be joined by former President Gerhard Casper, Board of Trustees Chair Isaac Stein, Trustees and Directors Denise O’Leary and John Freidenrich, Faculty representing Dermatology Al Lane and Youn Kim and Judy Swain representing the Clinical Chairs. Each commented on the accomplishments that Gene and Gloria Bauer provided during Dr. Bauer’s tenure as Chair of the Department of Dermatology (1988-1995) and then Dean and Vice President of the Medical Center (1995-2001). The Bauers’ children and grandchildren were present for the festive event that was held in the Iris and B. Gerald Cantor Center for the Visual Arts. Dr. Bauer began his sabbatical on December 1st and we all wish him a very Happy New Year and, again, thank him for all that he did to help shape and sustain the excellence of the Stanford University School of Medicine, the Medical Center and University.

Formation of Baxter Laboratory for Genetic Pharmacology

I am pleased to announce that the Baxter Foundation and Provost have approved our recommendation to form the newly endowed Baxter Laboratory for Genetic Pharmacology which will be devoted to developing novel cell and gene based therapies for human diseases. This new Laboratory will be located in CCSR and will be part of the Department of Microbiology and Immunology. I am also pleased to announce that Dr. Helen Blau has been named the first Director of the new Baxter Laboratory for Genetic Pharmacology. With these new responsibilities, Dr. Blau will step down as Chair of the Department of Molecular Pharmacology as of January 1, 2002. She will be joined by Dr. Garry Nolan and a new Assistant Professor to develop an exciting new interdisciplinary effort. The Baxter Foundation plans to formally celebrate this new Laboratory for Genetic Pharmacology in the Spring and details will follow.

Appointment of Senior Associate Dean for Pediatric and Obstetric Clinical Affairs

This year the Lucile Salter Packard Children’s Hospital (LPCCH) celebrates its 10th Anniversary. As discussed in the last edition of the Newsletter, with the announcement of the Children’s Health Initiative, the path for LPCCH to become a premier center of excellence in child health is now clear. The impressive presentation that Dr. Alan Krensky, Shelagh Galligan Professor of Pediatrics and Executive Director, Children’s Health Initiative (CHI), shared with the Board of Trustees Committee on the Medical Center on Monday December 3rd, gives further evidence of a very exciting future for LPCCH and Stanford. The CHI formalizes a special partnership among LPCCH, the School of Medicine, the Lucile Packard Foundation for Children’s Health and the David and Lucile Packard Foundation, to improve the lives of children and families of the 21st century through excellence and innovation in clinical care, research and education.

Based on the notable expansion of the clinical programs now underway at LPCH, and their continued growth over the next decade, it has become clear that a special focus on these programs is needed. Accordingly, I am pleased to announce the creation of the new position of Senior Associate Dean for Pediatric and Obstetric Clinical Affairs. I am further pleased to announce that Dr. Ken Cox, Professor of Pediatrics, Chief of the Division of Gastroenterology and Chief Medical Officer at LPCH has agreed to become the first incumbent of this new position in the Office of the Dean. In this new position Dr. Cox will represent the School of Medicine in its interactions with LPCH and the pediatric faculty, including the development of new clinical programs, clinical faculty performance and organization. Dr. Cox will work closely with Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, to coordinate the interactions between SHC and LPCH in clinical programs and affairs. Like our other Senior Associate Deans, Dr Cox will carry out his administrative responsibilities on a part-time basis so that he can sustain his clinical and related academic activities at LPCH and Stanford.

One of the most important topics to be addressed in the coming months is the development of a Physicians' Organization and Practice Plan, including its joint relationship to the School of Medicine and respective hospitals. There is little question that the development of a practice plan and its coordination and integration with faculty and the Hospital is of enormous importance. Dr. Cox has already been leading an important effort in Physician-Hospital integration at LPCH and his experience, knowledge and commitment will prove enormously important in this highly critical area.

Please join me in welcoming Dr. Ken Cox to his new position as Senior Associate Dean for Pediatric and Obstetric Clinical Affairs.

Compliance Oversight Committee Focuses on the Intersection Between Clinical Innovation and Conflict of Interest

At the School's newly founded Compliance Oversight Committee that met on December 5th, we continued our discussion about the important and complicated topic related to the intersection between clinical innovation and "conflict of interest". This is an extremely important issue. Bringing new innovations and discoveries to improve the health of our patients is one of the most important things we can do at Stanford. Not infrequently, new inventions or devices are discovered by a faculty member who may also have equity interest in its development. The role of such a faculty member in evaluating such devices or therapies is a topic that has engendered both debate and regulation, locally and nationally.

It must, of course, be recognized that the goal to assure patient safety is first and foremost. There are also clearly situations when the individual who has invented the new device, procedure or product may also be the very best person to carry out its evaluation. However doing so can present a "conflict of interest" if that surgeon or physician is also an investor or paid consultant in the development of the device or product. The Compliance Oversight Committee has recognized the importance of an ongoing dialogue with our faculty, to have the opportunity to present their perspective on this matter. In

addition to assuring patient safety, it is also important to assure the integrity of our clinical research enterprise and the opportunities for our faculty to continue to discover and innovate at Stanford. To continue to engage faculty in this important dialogue, the Conflict of Interest Committee, led by Dr. Ed Mocarski, Professor of Microbiology and Immunology, will establish a series of faculty forums during the next year. Details will follow.

Special Meeting for Pediatric Faculty and Staff on Tuesday December 12th

On Tuesday December 12th, I and other members of the Office of the Dean will hold a special meeting for faculty and staff of the Department of Pediatrics. The meeting will begin promptly at 4:30 PM in the Freidenrich Auditorium at LPCH and last for only 30 minutes. I strongly recommend that the faculty and staff in Pediatrics make every effort to attend this meeting.

Faculty Senate Approves the Interdisciplinary Program in Health Services Research

On Thursday Nov 29th, the University Faculty Senate evaluated and approved the review of the Health Services Research Interdisciplinary Program that is coordinated by Dr Mark Hlatky, Professor and Chair of the Department of Health Research and Policy. Although recommending that the scope of the program is broadened, the review committee and Senate recognized that the training program is excellent in its primary area of focus, namely cost of care.

Proposed Joint Department of Bioengineering Brought to President and Provost

On Thursday December 6th, Jim Plummer, Dean of the School of Engineering, and I met with the President and Provost to officially inform them that our two schools were committed to forming a joint department of bioengineering. This was met with considerable enthusiasm. We will now proceed to work jointly on the important topics of undergraduate and graduate education, academic governance and relations, and finance and administration. It is recognized by all that we will surely encounter impediments and barriers but we are committed to overcoming them in order to achieve a successful outcome. We further recognize that these efforts will serve as a model for other broad interdisciplinary efforts, including BioX.

The work will take place through four subcommittees beginning early in 2002, with the goal of completing the initial phase of the program development by the end of the academic year. This is, of course, outstanding news and I will look forward to sharing updates in future Newsletters.

Seeing for the First Time

I have walked rapidly through the corridors of Stanford Hospital & Clinics and the Packard Children's Hospital countless times on my way to various meetings or events since my arrival in April. During those times I had noticed the remarkable artwork on its walls. However, it was only on Tuesday December 4th, that my pace was slowed and I became more informed about how extraordinary the artwork truly is. On that occasion, Mrs. Helen Bing, who is responsible for supporting and overseeing the development of the extraordinary gardens and wonderful artwork that enriches the Medical Center, took me on a tour that was amazing and informative. The extraordinary contributions of Helen and Peter Bing to the Medical Center and University are renowned. What I witnessed also was the personal compassion, care and commitment of the woman who has made so much of this possible for our patients and staff. I add my voice to the chorus of so many others to give thanks to the wonderful contributions of Helen Bing and her family.

Medical Staff Update Survey

The Office of News and Public Affairs asked that I inform you that it is inserting a readership survey in the December issue of Medical Staff Update. They need the help of the medical staff in completing the survey. The goal is to find out how useful the publication is to the medical staff and how it might be made better. Please do your best to help.

Appreciation

Farewell to Tom Jackiewicz. On Tuesday December 4th the Department of Medicine bid thanks and farewell to Mr. Tom Jackiewicz who will leave for a new and exciting position at UCSD. Tom has worked closely with Dr. Judy Swain, Professor and Chair of Medicine and together they have made enormous contributions. I add my thanks to Tom as well. I too have been very impressed with his many talents and contributions and know that he will be missed by the Department and the School.

Radiation Oncology Faculty. I also want to thank Dr. Richard Hoppe and the Department of Radiation Oncology for inviting me to their December 4th faculty meeting. I continue to attend faculty meetings throughout the School and find this a tremendously valuable way to meet faculty and learn about the challenges and issues facing individuals and departments.

Appointments and Promotions

I am very pleased to announce that the following individuals have been approved for appointment or promotion.

R. Christopher Hayward has been reappointed as Associate Professor of Psychiatry and Behavioral Sciences at Stanford University Medical Center for the term 11/01/01-11/30/05

Paul T. Pitlick has been reappointed Associate Professor of Pediatrics at Lucile Salter Packard Children's Hospital for the term 11/01/01-8/31/06

R. Lawrence Moss has been promoted to Associate Professor of Surgery and of Pediatrics at Stanford University Medical Center for the term 10/01/01-9/30/06

Upinder Singh has been appointed as Assistant Professor of Medicine (Infectious Diseases) for the term 11/01/01-10/31/04

Henry Lowe has been appointed as Associate Professor of Medicine (Research) for the term 11/01/01-10/31/07

Gregory S. Barsh has been promoted to Professor of Pediatrics and of Genetics effective 11/01/01

Congratulations to all.

Dean's Newsletter

January 7, 2002

Award Opportunity for Bioengineers

Announcement by Jim Plummer, Dean of the School of Engineering and Phil Pizzo, Dean of the School of Medicine

A New Year

A week has already passed since 2002 began officially. I have now reached a human gestation period at Stanford and the past nine months have been exciting indeed. The year ahead, however, will be an important one as we move forward with our comprehensive School-wide Strategic Planning Process. With this, the course for Stanford's future for the next decade and beyond will be debated and defined and by year's end, I hope we will be launching the first phase of our Campaign for Stanford Medicine as we reach out to bring our dreams to reality. It is a time for bold thinking and for striving hard to make Stanford the global model of a research-intensive School of Medicine for the 21st Century. I am pleased you will be part of this effort.

Next Town Hall Meeting on January 22nd

In anticipation of our initial Strategic Planning Retreat that will be held from February 8-10th, I want to invite you to our second Town Hall meeting, now scheduled for Tuesday January 22nd, at noon in the Fairchild Auditorium. (This is a change from the previously noted date of Monday, January 14th.)

At this Town Hall meeting we will plan to update you on some of the issues that will be brought to the Retreat. Most importantly, I am interested in getting your feedback and reactions so that they can help shape the agenda and plans that are emerging for the future of Stanford Medicine. I do hope you will be able to join us on January 22nd at noon in the Fairchild Auditorium.

Public Library of Science

At the Executive Committee meeting on December 21st, Dr. Pat Brown, Professor of Biochemistry, gave a presentation on a project he has been leading called the Public Library of Science. The goal of the Public Library of Science is to make the world's scientific and medical literature freely accessible to scientists, physicians and the public around the world. This bold project is based on the premise that all papers should be free and available to the public. He and his colleagues propose to make the original published reports of ideas and research results freely available, online, without restrictions on use or further distribution and free from both public and private control. A sub-premise is that the business models of scientific publishers have failed to respond to the extraordinary changes in the economics of scientific publication.

However, achieving a Public Library of Science confronts a number of major publishers as well as professional societies, many of whom count on the proceeds from published journals to help support their operations and activities. That said, a large number of journals have already made their published information available on public servers after 6-12 months on their own server. However, some of the leading and most prestigious scientific journals have not yet agreed to do so. This has led Pat Brown, along with Harold Varmus, previously Director of the National Institutes of Health and presently President of Memorial Sloan-Kettering Institute, to engage scientists from around the world to not submit articles to those journals until they agree to make information available on public servers at least within a year of publication. To date, approximately 29,000 scientists, from 174 countries, including a number from Stanford, have signed this Open Letter supporting the Public Library of Science initiative.

Dr. Brown laid out a series of issues that Stanford, as a Medical School and University, might engage with in order to support the Public Library of Science. These must recognize the consequences that might impact publishers, professional societies and, importantly, our students, trainees and faculty, who now rely on publication in leading peer-reviewed journals for career development. Those implications require careful and thoughtful debate and we would all like your input.

Among the questions I would hope to get some feedback about are:

- How do you feel about the concept of a Public Library of Science?
- Would you be willing to withhold submission of papers to Journals that did not participate in making publications available online to the Public Library of Science?

- How do you feel about this process if you are a student or junior faculty member whose promotions and career development is still under development?
- How do you feel about Stanford University School of Medicine taking an institutional stand on the Public Library of Science?

Please be aware and assured that these questions and the related issues are, at this point, only topics for discussion. However, your input will help inform that discussion, so please let me know what you think.

Conflict of Interest Guidelines Released

Recently, the AAMC Task Force Issues Guidelines on Financial Conflicts of Interest on the oversight of individual interests has been unanimously approved by the AAMC Executive Council and released to the public. The report is available at <http://www.aamc.org/coitf>. I would strongly encourage you to access and review this document. It will certainly serve as a template for institutional policies regarding conflict of interest and is already under review at Stanford.

Government Policies Impacting Children's Hospitals

When Congress recessed on December 20th there were two big legislative wins for children's hospitals. First, Congress increased independent children's hospitals' GME funding by 21%, and secondly, it reauthorized the FDA's patent extension for products studied for pediatric use. Affecting all academic medical centers, Congress also increased the overall NIH budget by 15%.

These are issues that many of us have advocated for with colleagues around the nation and it is good news for children's hospitals and for academic medicine.

Changes in Tenure Policy Regarding Parental Leave

Effective January First, the Provost has announced revisions to the University's faculty policies for new parents. The following comments come from a letter from the Provost:

REVISION IN THE TENURE POLICY AND IN RELATED APPOINTMENT POLICIES FOR NON-TENURE LINE ACADEMIC COUNCIL AND MEDICAL CENTER LINE FACULTY

Currently, an untenured member of the tenure line faculty who gives birth may request an extension of her tenure clock of one year. Effective January 1, 2002, this tenure clock extension will also be available to new fathers and to faculty who adopt a child under the age of six.

Similarly, faculty with term appointments in the non-tenure line of the Academic Council and in the Medical Center Line who give birth may currently request a one-year extension of their appointments. Effective January 1, 2002, this extension will also be available to new fathers and to faculty who adopt a child under the age of six. Faculty wishing to take advantage of this policy will be asked to state that they have substantial and sustained childcare responsibilities. In addition, requests for the extension should be made within one year of the arrival of the child. Requests should also be made prior to the beginning of the last year of the faculty member's tenure clock. For non-tenure line and Medical Center Line faculty, requests should be made prior to the beginning of the final year of the faculty member's appointment. The revised policies and the application form are online at <http://facultyhandbook.stanford.edu/ten.html>.

As a transition measure, the expectation that requests be made within one year of the arrival of the child will be waived for the period January 1, 2002 to June 30, 2002. However, even for this transition period, faculty who request an extension should not be in the final year of their tenure clock or, for non-tenure line and Medical Center Line faculty, in the last year of their current appointment.

REVISION IN THE REDUCED TEACHING AND CLINICAL DUTIES POLICY

The purpose of this policy is to provide faculty who become new parents with additional flexibility in their work schedule at the time of the birth or adoption of a child. Currently, a faculty member who gives birth may request a reduced teaching load during the quarter of the birth and/or the quarter after the birth if these are quarters during which she would normally teach. Effective January 1, 2002, a teaching load reduction will also be available to new fathers and to faculty who adopt a child under the age of six. This reduction will be available during the quarter of the child's arrival or the following quarter, if these are quarters the faculty member would normally teach.

Current policy also allows women faculty in the School of Medicine who have clinical duties to request a reduced clinical load for 90 days following a maternity leave. Effective January 1, 2002, a 90-day clinical load reduction following the arrival of the child will also be available to new fathers and to faculty who adopt a child under the age of six.

This policy is intended for parents who have substantial and sustained childcare responsibility; it is not intended for parents whose newborn or newly adopted child is cared for more than half-time by either a spouse or a childcare provider. A faculty member using this policy would normally be the sole caregiver for at least twenty hours during the work week during the hours from 8 a.m. to 7 p.m., Monday through Friday. To apply for this policy, faculty should complete the form entitled "Application for Reduced Teaching or Clinical Duties for New Faculty Parents." The revised policy and the application form are online at <http://facultyhandbook.stanford.edu/ten.html>.

Leadership Changes in the Department of Medicine

At the close of 2001, Dr. Judy Swain, Professor and Chair of the Department of Medicine announced several leadership changes, which I am pleased to be able to share with our entire community.

1. **Dr. Richard Lafayette** has been appointed Associate Chair for Clinical Affairs in the Department of Medicine, a position previously held by Dr. Norman Rizk who became Senior Associate Dean for Clinical Affairs.
2. **Dr. Frederick Kraemer** has been appointed Chief of the Division of Endocrinology and Gerontology, effective January 1, 2002. According to Dr. Swain's announcement, "the proposed changes in the research and clinical programs are anticipated to greatly strengthen the training program in endocrinology that encompasses fellow, resident and medical student education."

Congratulations to Drs. Lafayette and Kraemer for their important new appointments in the Department of Medicine.

Announcement: 2002 Albion Walter Hewlett Award Nominees Sought

Nominations are being sought for the 2002 Albion Walter Hewlett Award to honor an extraordinary physician with ties to Stanford. Nominees should be past or present students, house officers, fellows or faculty who have "consistently, over decades, demonstrated the exemplary combination of a scientific approach to medicine and sensitivity to patients". If you wish to make a nomination, please use the nomination form at http://deansnewsletter.stanford.edu/hewlett_nom_form_2000.pdf

Awards and Honors

1. **Dr. Mary Lake Polan**, Professor and Chair of the Department of Gynecology & Obstetrics, has been elected to the Council of the Institute of Medicine of the National Academy of Sciences. This is affirmation of how valued Dr. Polan is by the Members of one of the most prestigious national organizations.
2. **Dr. Bruce Feldstein and Marita Grudzen,RT,MHS** are recipients of the Templeton Foundation award for their work in spirituality and medicine curriculum. Stanford is one of six medical schools to receive this award in this relatively new area of curriculum.
3. **Stanford Medicine** has continued its outstanding performance in the Society of Publication Designers annual illustration competition for the past two years. Over 8,000 illustrations were submitted each of the past two years and under 10 percent

were selected for Merit Awards. Of these, three *Stanford Medicine* illustrations were selected in 2000 and two were selected in 2001. Among the other Merit Awardees were National Geographic, Newsweek, the New York Times Magazine, Time Inc. and the Wall Street Journal.

4. **Dr. Daria Mochley-Rosen**, Professor of Molecular Pharmacology, was selected to give the Presidential Lecture at Association of University Cardiologists

Congratulations to all.

Dean's Newsletter

January 22, 2002

President and CEO of Stanford Hospital & Clinics (SCH) Appointed

Respect in Our Workplace

With the beginning of the New Year and the exciting prospects for our individual and collective futures that will emerge through our School-wide Strategic Planning efforts and other important initiatives, it is important that we take stock of how responsive our workplace is to handling the additional burdens of challenge and change and, even more importantly, that we assure that it our workplace is respectful to all who work on behalf of the School and Medical Center.

First, I am cognizant that our students, faculty and staff are all working very hard. I am also aware that the burden of responsibility and workload has increased during the past years and that we must acknowledge the limits of our mutual limitations. This is especially the case when new expectations are initiated without altering or decreasing those already being performed. Accordingly, I have asked the senior administrative leaders within the School of Medicine to address current workflow and related expectations, and to seek creative ways of reducing or eliminating unnecessary or redundant work efforts or procedures. I would encourage all members of our staff to review what they are now doing and bring forward suggestions to their respective DFAs and administrative leaders about better ways to get our work done. An important part of this is to find ways to improve the work/personal balance for all members of our Medical School community.

In addition to the workload challenges we all face, I want to underscore how importantly the Senior Deans and I view the respect and integrity in our workplace and its relationship to our missions and our School. The statement currently contained in the Faculty Handbook captures these principles and is noted immediately below:

Stanford University School of Medicine is committed to providing a work environment that is conducive to teaching and learning, research, the practice of medicine and patient care. Stanford's special purposes in this regard depend on a shared commitment among all members of the community to respect each

person's worth and dignity. Because of their roles within the School of Medicine, faculty members, in particular, are expected to treat all members of the Stanford community with civility, respect and courtesy and with an awareness of the potential impact of their behavior on staff, students and other faculty members.

Despite what has been written, I am well aware that Stanford Medical School has not always been viewed as a "respectful workplace" as it should be. Since arriving last April, I and the Senior Deans have done as much as we could to make clear that we would have zero-tolerance for inappropriate behavior, including sexual harassment or any form of discrimination. I want to underscore that commitment. Should you have concerns please contact a member of the Dean's Office or our Ombudsperson, Ms. Martha McKee.

A respectful workplace is something we all want and that we all deserve. It is up to each of us to make that happen. It is also up to our leadership to address any concerns that arise. I am committed to doing so.

Chair of the Leadership Council for BioX Appointed

On January 28th, Dr. Matt Scott, Professor of Developmental Biology and of Genetics was named the Chair of the Leadership Council of the BioX program. This is a new position, which reports to the Dean of Research in coordination with the Deans of the Schools involved with BioX and the Clark Center. A Search Committee consisting of members from the Schools of Medicine, H&S, Engineering and SLAC recommended Dr. Scott for this position. In virtually everyone's opinion, Dr. Scott is uniquely qualified to Chair the Leadership Council for BioX. He will also remain a member of the Howard Hughes Medical Institute while assuming these new responsibilities.

Dr. Scott's appointment and the new Leadership Council represents further evolution in the maturity and development of the BioX program, including those that will reside in the Clark Center. In considering this position, Dr. Scott notes that "I am grateful to all the people who have worked, and are working, so hard to build this Program. Jim Spudich, Steve Chu, Channing Robertson, and other faculty, and the University leadership, deserve enormous credit for undertaking a challenging and exciting new approach to bringing disciplines together. The two great gifts, from Jim Clark and the anonymous donor, have brought the Program to life."

I know that I and others throughout the School and University also want to add our thanks and appreciation to Jim Spudich and Channing Robertson and many other faculty for their important leadership during the past several years.

In conjunction with the Deans from the Schools engaged in BioX, several programmatic areas are being considered for the Clark Center, including Biocomputation, Biophysics, Biodesign, Bioengineering, Chemical Biology, Genomics/Proteomics and Regenerative Medicine (including stem cells). The Clark Center will also be a gathering place where people who are not residents of the building and will include visiting scientists and

engineers from campus and beyond. That way the BioX and Clark Center programs can maintain flexibility and accommodate and support new ideas for interdisciplinary efforts.

A key to the success of the BioX Program and the Clark Center will be to make it easier for students and fellows to undertake projects that take advantage of knowledge from multiple fields. As Dr. Scott notes: “Much remains to be done to make it easy for teams from different fields to work effectively together on a biological problem. Simply putting people from different fields near each other is not nearly enough. We will need to create new curricula, alter the usual single student-single mentor structure, and find ways to overcome the language and conceptual barriers that prevent useful collaboration. In industry it is routine to form multi-disciplinary teams, but that model is only useful to an extent since their goals are often short-term and highly defined. We need to create such teams, or really create a way for such teams to continuously form, but with the long-term triple goals of education, discovery, and invention. As we continue to build the Program, we will be asking faculty, students, and fellows to identify specific mechanisms for creating diverse and functional teams.”

“Education is the key to successful interdisciplinary research. I think that BioX will become recognized as an important educational initiative. BioX should be very exciting for undergraduate students, graduate students, medical students, postdoctoral fellows, and clinical scientists.”

Although the concept of interdisciplinary research and education has become a goal for many institutions around the country, Stanford remains the pacesetter in this exciting new domain. With Dr. Scott’s appointment, the role that Stanford will play in opening new research and educational pathways seems assured – and very exciting.

Appointments and Reappointments of Department Chairs

During the past months a number of transitions, appointments and reappointments of basic and clinical science chairs has occurred. Among these are the following:

- Dr. David Botstein, who has served as Chair of the Department of Genetics for the past decade, will step down on January 31st and be succeeded by Dr. Rick Myers. We all owe a great debt of gratitude to Dr. Botstein for building one of the finest Genetics departments in the world.
- Dr. Helen Blau stepped down as Chair of the Department of Molecular Pharmacology on January 1st to assume directorship of the Baxter Laboratory. We are currently working the Department to appoint its next leader and have every expectation for an outstanding future for molecular pharmacology and chemical biology in the years ahead.
- Dr. Gary Glazer was reappointed Chair of the Department of Radiology and will continue to develop the outstanding program he has helped put into place during the past decade.

- Dr. Roeland Nusse will serve for an additional year (thanks to special permission from HHMI) as Chair of the Department of Developmental Biology.
- Dr. Gary Steinberg has been reappointed Chair of the Department of Neurosurgery. Under his leadership Dr. Steinberg has built an outstanding clinical and research program in neurosurgery and neuroscience.
- Dr. Judy Swain has been reappointed Chair of the Department of Medicine and will also continue her work in further developing the outstanding clinical and research programs that have been initiated during the past five years.

I am enormously pleased and honored to be able to work with these outstanding leaders and colleagues.

School of Medicine Strategic Planning Initiatives

As you know, we are continuing our working groups in anticipation of the Strategic Planning Retreat that will be held on February 8-10th. Seventy-two participants will be engaged to review the School's evolving strategic initiatives in medical student education, graduate student education, postdoctoral training, research, clinical care and the professoriate necessary to carry out these missions. These will be complemented by examining how to achieve our goals through current and future approaches to finance and administration as well as through communications, information technology, advocacy, public policy and philanthropy.

Participants at the Strategic Planning Retreat will include senior leaders from the Office of the Dean, University Officers, Trustees, Department Chairs and selected senior faculty, Hospital CEOs, students, trainees and staff. It is our hope that we will emerge with a shared understanding of the Medical School's mission and goals and a compelling vision for its future. I also hope that this Retreat, which I view as a beginning rather than a conclusion, will help us establish a process for continuous planning and resource allocations based on critical evaluation and prioritization so that we can fulfill our mission.

Having gone through several reviews and iterations, our current working Mission Statement is **“to be a premier research-intensive School of Medicine that improves health in the 21st century through discoveries, leadership and innovations in education, patient care, and biomedical and clinical research.”**

In anticipation of the discussions that will unfold at the Retreat and thereafter, presentations of Working Group discussions are being made to the School's Executive Committee, Faculty Senate, Town Hall meetings and the University Board of Trustees Committee on the Medical Center. I anticipate a working summary of our plans and initiatives by April. These will serve as the basic “floor plans” for defining the next decade of programmatic and capital initiatives that will help us assure our goal as a global model of a premier research intensive medical school for the 21st century.

Medical School Faculty Senate on Clinical Curriculum

On Wednesday, January 16th the Medical School Faculty Senate passed the second phase of the clinical clerkship reform. The first phase of the reforms was passed last year and mandated that four of the six required core rotations must be taken during the first 12 months of clinical rotations, with two of these being Medicine and Surgery.

In the new recommendations, the minimum amount of time for clinical clerkships remains the same (15.5 months) and the cores remain unchanged. However, the distribution of the clerkships will be changed. These will now also include one month of Neurology, a one month rotation in Critical Care Medicine (choices include Adult Medical ICU (either at SHC or the VA) or Surgical ICU (SHC) or the Pediatric ICU or Neonatology (both at LPCH). In addition, there will be a one month clinical elective. Whether this clinical rotation will include non-direct patient care experiences (e.g., pathology or radiology), will be determined at the March meeting.

In addition, a two-month ambulatory rotation will be required. During this time the students will be exposed to a number of medical and surgical subspecialties which provide experience in a number of different disciplines (examples include ENT, Ophthalmology, Urology, Rheumatology, Pain Management, Anesthesiology, etc).

Recognizing the value of these modifications and changes in the clinical curriculum, it is important to note that the overall medical student curriculum is a major topic of our School-wide Strategic Planning efforts and that other even more substantial changes and recommendations are likely to unfold during the months ahead.

Conference on Preventive Health Care for Women

On Tuesday January 29th, Women's Health @ Stanford will present "Preventive Health Care for Women: Global Attitudes & Access," a conference to share knowledge and raise awareness of issues related to women's preventive health. Its purpose is to educate and to act as a catalyst for changing attitudes about and access to preventive health care for women on a global scale. This conference will take place from 1:30 to 7:00 p.m., at Kresge Auditorium, Stanford University, and is free and open to the public. The conference will include panels on:

1. Global Implications of Women's Health
2. The Importance of Prevention for Women
3. Improving Access: What We Can Do to Make Preventive Care Accessible for all Women.

The conference will conclude following the Plenary Speaker, RADM Susan J. Blumenthal, M.D., M.P.A., U.S. Assistant Surgeon General, Rear Admiral and

Science Advisor, U.S. Department of Health and Human Services.

Women's Health @ Stanford is a multidisciplinary initiative that serves as an umbrella for integrating all women's health activities at Stanford. The mission of WH@S is to provide comprehensive health services for women across their lifespan through cutting-edge research, patient and provider education, high quality patient care, and influencing health policy. Women's Health @ Stanford is led by Dr. Linda Giudice, Director, and Ellen Lovelace, Executive Director.

Stanford Blood Center Urges Donations

With National Volunteer Blood Donor Month lasting through January, Stanford Blood Center has joined forces with the American Association of Blood Banks to urge every eligible person to donate. Throughout the first month of the year, new donors are needed to ensure a safe and plentiful blood supply.

Stanford Blood Center supplies blood products to Stanford Hospital & Clinics and Lucile Packard Children's Hospital. Both hospitals carry out advanced state-of-the-art organ transplantation and surgical procedures for which blood availability is essential. A unique feature of the Stanford Blood Center is its integration with research programs that concentrate on causes, prevention and treatment of blood diseases and blood-borne disorders.

More than 34,000 blood donations are made annually through the center. Each donation is separated into platelets, plasma and red cells, potentially helping up to three different patients. Donors should be in good health with no cold or flu symptoms. They should also eat well prior to donation, drink fluids and present photo identification at the time of donation. The donation process takes about one hour. Donors are urged to call (650) 723-7831 or toll-free, (888) 723-7831, to make an appointment, learn hours of operation and get directions. For more information, please visit <http://bloodcenter.stanford.edu>.

Dedication of the Freidenrich Auditorium at the Lucile Packard Children's Hospital

On Wednesday, January 16th, the Freidenrich Auditorium was dedicated to recognize the tremendous contributions of Jill and John Freidenrich to the care of children and families at the Lucile Packard Children's Hospital and, by extension, throughout the world.

Dr. Harvey Cohen, Chair of Pediatrics and the Arline and Peter Harman Professor of Pediatrics, noted that the Freidenrich Auditorium would be used for lectures, faculty meetings, conferences and that it would provide an opportunity for teaching and learning about advances in pediatrics, now and in the future. Giving evidence to this, Dr. Michael Link, Chief of the Division of Hematology, Oncology and Stem Cell Transplantation and Professor of Pediatrics, reviewed the incredible progress that has been made in the treatment of childhood malignancies and the prospects for future accomplishments that will unfold in the decades ahead. Stanford faculty has played a significant role in these discoveries and clinical innovations that have led these outcomes. Future successes, along

with those from other research programs, will also be shared in the Freidenrich Auditorium during the years ahead.

Thanks to the Freidenrich family for making this auditorium a part of our Medical Center.

Appointments and Promotions

I am most pleased to announce the following appointments, promotions and reappointments to the professoriate

- **Dr. Thomas Clandinin** to has been appointed Assistant Professor of Neurobiology, 2/1/02-1/31/05
- **Dr. James Ford** has been reappointed Assistant Professor of Medicine (Oncology) and of Genetics, 2/1/02-8/31/05
- **Dr. Kate Lorig** to has been promoted to Professor of Medicine (Immunology & Rheumatology) (Research), 2/1/2002 to 1/31/2008
- **Dr. Gil Chu** has been promoted to Professor of Medicine (Oncology) and Biochemistry, effective 2/1/2002

Congratulations to all.

Dean's Newsletter February 4, 2002

Strategic Planning Update: Initial Strategic Initiatives are Presented for Your Review and Input

As you hopefully know by now, our Strategic Planning Retreat will take place this weekend, February 8-10, 2002. While this will be an important event, it represents only the beginning of our efforts to help chart the future of Stanford University School of Medicine for the 21st Century. Certainly the discussions that will take place at the Retreat will be important. However of equal value will be the coordination, further elaboration of ideas impacting our missions in education, research and patient care, and most importantly, their implementation during the years ahead. Your role in this process will be most important and appreciated

I initiated this Strategic Planning process last summer, based on the recognition that we stand at the crossroad of opportunity and challenge (as initially outlined in my first Newsletter on April 2, 2001). Without question we are privileged to be part of one of the world's great universities and schools of medicine. However, to sustain and enhance our university and school for the decades ahead, we have an obligation to critically assess the role that we can and must play in the future of medical education and research, and their impact on improving health.

Central to our fulfilling our goals and objectives is an affirmation of our more defined mission:

The mission of the Stanford University School of Medicine is to be a premier research-intensive school of medicine that improves health in the 21st century through discoveries, leadership and innovations in education, biomedical and clinical research and patient care.

During the past several months, nine Work Groups have addressed various aspects of our mission, assessing our strengths, weaknesses and opportunities in each area. Based on those discussions, faculty, students and staff have developed a number of mission relevant strategic initiatives. These now require processing and prioritization with the understanding that some need to be addressed now, whereas others will unfold during the next 5-10 years. Several of these initiatives will emerge from the current “blue-print” to become the programs and buildings that will shape the Campaign for Stanford Medicine which we hope to initiate in early 2003.

I am taking the liberty of including highlights of the various Strategic Initiatives that have come from the Work Groups in this Newsletter. At this juncture I hope you will take the time to read them and that you feel free to comment on them. I am noting, in each area, the key individuals to contact if you wish to share your comments and add any additional perspectives or suggestions you think appropriate. I hope is to share, debate and discuss ideas and proposals that will help make the Stanford University School of Medicine a role model for the 21st century. Achieving these goals will require much time and effort, but it is worth striving for. I look forward to the opportunity to begin the journey with you.

Highlights of the Strategic Initiatives Developed by Work Groups Prior to the Strategic Planning Retreat of February 8-10, 2002

Medical Education: Contact person is Dr. Julie Parsonnet

1. Curriculum Revision Initiative

To ensure a rigorous and robust curriculum that assures outstanding clinical skills and promotes in-depth scholarship, revise the curriculum to (1) identify core knowledge and skills required for all students, (2) expand the clinical curriculum, particularly in the first years of medical school, to enhance pattern recognition, (3) develop required majors (scholarly tracks) for all students to enhance independent research capabilities, (4) within scholarly tracks, develop a research honors program for a subset of students. (5) develop a system of incentives to promote curricular change.

2. Teaching Initiative

To foster and facilitate teaching, advising and mentoring among our faculty, (1) establish a certain level of teaching as a requirement of a faculty appointment at Stanford, (2) create mechanisms to honor, promote and facilitate teaching including programs for

recognition of excellence and innovation, and (3) create mechanisms of support for pedagogy.

3. Educational Facilities Initiative

To ensure a rigorous and robust curriculum that assures outstanding clinical skills and promotes in-depth scholarship, undertake facilities improvement to provide small group learning space, technology-assisted learning environments and contemporary library/informatics space.

Graduate Education: Contact persons are Drs. Karla Kirkegaard and James Nelson

1. Fellowships/Tuition Endowment Initiative

To ensure that Biosciences students are the highest-quality students available and that they are offered an unsurpassed quality, depth and breadth of graduate research opportunities, increase the number of Presidential Fellowships (or equivalent) available to Biosciences Graduate students and/or establish an endowment to make graduate education tuition-free.

2. Diversity Initiatives

To ensure that Biosciences students are the highest-quality students available and that they are offered an unsurpassed quality, depth and breadth of graduate research opportunities, develop programs to establish Stanford as a national leader in biosciences education of under-represented minorities (URMs).

3. Student-Initiated Programs Initiative

To provide high quality training programs that feature innovative, multi-disciplinary and student-initiated course offerings and to provide and encourage opportunities for scientific interchange and student-initiated cross-disciplinary training and to provide continued individualized guidance for each student's research and education, encourage the development of student-initiated reading courses and provide funding and organizational support for student-initiated Biosciences mini-symposia.

4. Basic Clinical Programs Initiative

To provide high quality training programs that feature innovative, multi-disciplinary and student-initiated course offerings and to provide and encourage opportunities for scientific interchange and student-initiated cross-disciplinary training and to provide continued individualized guidance for each student's research and education, strengthen connections with clinical departments to make research-oriented courses, joint seminars and symposia programs in disease mechanisms, histology and physiology available to Biosciences students, and develop joint seminar and symposia programs with clinical departments in disease mechanisms.

5. Graduate Education Facilities Initiative

To ensure that Biosciences students are the highest-quality students available and that they are offered an unsurpassed quality, depth and breadth of graduate research

opportunities, establish an intellectual and physical “home” for the Biosciences Graduate Program, including space for seminar rooms, informal gathering and food service.

Postdoctoral Education: Contact persons are Drs. Joe Lipsick and James Nelson

1. Total Compensation Programs Initiative

To ensure that the intellectual, research and work-life environments at Stanford attract and retain the highest quality postdoctoral scholars, develop and achieve an institutional standard for total compensation for postdoctoral scholars through: (1) increasing the inventory of affordable Stanford housing available to postdoctoral scholars, (2) enhancing the benefits package available to postdoctoral scholars, (3) developing a childcare program to address the economic and work schedule constraints of postdoctoral scholars, and (4) developing a compensation program that resolves current differences between salaries and stipends.

2. Career Center Initiative

To provide support for postdoctoral scholars to pursue the career paths of their choice, coordinate with the Office of Graduate Education to initiate a Career Center and professional development program with knowledgeable and helpful professional staff.

Research Programs: Contact person is Dr. James Nelson

1. Junior Faculty Initiative

To ensure scientific excellence, innovation and leadership through the recruitment and retention of outstanding faculty, establish a preference for new junior faculty unless there is a compelling need to jumpstart a program.

2. Translational Research Programs Initiative

To be a world-leader in the translation of new knowledge and scientific innovation to clinical applications, promote collaborations between basic and clinical scientists within the medical school and across the university through (1) the mitigation of existing cultural and geographic barriers, and (2) the inclusion of collaborating departments as partners in faculty search and promotion processes.

3. Core Facilities Initiative

To be a world-leader in the translation of new knowledge and scientific innovation to clinical applications and to promote the rational allocation and efficient use of the medical school’s research resources, develop a comprehensive array of research (including translational research) core facilities, incorporating the principles of (1) effective management and communication, (2) rational budgetary oversight, (3) accessibility and affordability, and (4) sustainability.

4. Research Resources Allocation Initiative

To promote the rational allocation and efficient use of the medical school’s research resources, develop a transparent process for the allocation and reallocation of research

resources that includes: (1) a “bottom-up” decision-making process, (2) openness to new organizational models, and (3) balanced support of established and new opportunities.

Clinical Programs: Contact persons are Drs. Norm Rizk and Ken Cox

1. Translational Research Initiative

To develop and incorporate new knowledge and treatment modalities into disease management through clinical and translational research strengthen opportunities and formalize mechanisms for clinical innovation within the healthcare delivery systems.

2. Rationalization of Health Care Initiative

To develop relationships with external partners to foster a robust clinical and educational program, develop an SUMC and Stanford FPO strategy addressing the provision of tertiary and quaternary services by Stanford, and its partnership with regional primary care providers.

3. FPO Initiative

To develop a flexible and high quality faculty physician’s organization to support the faculty’s clinical activities, develop a Stanford Faculty Physicians’ Organization in coordination with the structures of the two hospitals (SHC and LPCH) that includes: The development of a data-driven investment model for new program evaluations, funding and performance expectations.

The development of an aggressive quality of care program that establishes the Stanford FPO as the quality provider of choice for referring physicians and the local community.

The Professoriate: Contact person is Dr. David Stevenson

1. Single Community of Faculty Initiative

To create and promote a professoriate that values equally the activities and contributions of all scholars, including researchers, educators and clinicians and to establish a single community of faculty that embraces all of the contributions of medical school faculty and their university and community-based partners in the fulfillment of the school’ mission: (1) create a professoriate based on primary functional roles, (2) establish university standards for faculty scholarship that includes the scholarly activities of clinician and educators, (3) clarify the use and appointment and promotions criteria of other academic titles, (4) clarify the use and appointment and promotions criteria of other titles and (5) establish benefits parity for all faculty.

2. Faculty Outreach Programs Initiative

To maintain effective programs of future faculty development and outreach that recognize the value to the medical school’s mission of a diverse faculty across all ranks, develop offices for student and faculty diversity and for women in medicine and develop community and secondary education faculty outreach programs to expose under-represented minorities to careers in the biosciences.

Finance and Administration: Contact person is Mr. Mike Hindery

1. Resource Allocation Initiative

To create a responsive administrative organization that effectively provides the resources, infrastructure and incentives required to support the School's education, patient care and research activities, revise resource allocation principles and methodologies to align them with school priorities.

2. Continuous Planning Initiative

To ensure the optimum utilization of the School's resources, develop a continuous planning and evaluation function.

3. Staff Accountability and Responsibility Initiative

To develop and promote an acknowledged standard for administrative excellence based on the core values of professionalism, integrity and personal responsibility and service, develop mechanisms for the establishment and exercise of administrative staff accountability in the conduct of the Medical School's business.

4. Staff Rewards and Incentives Initiative

To continuously promote a culture that clearly recognizes and values the role of staff as partners in the success of the School's core missions and to create an environment that attracts and retains the highest quality staff, revise faculty and staff compensation plans to ensure appropriate rewards and incentives and develop mechanisms for rewards and incentives for administrative partners across SUMC organizations.

Advocacy, Public Policy and Philanthropy: Contact persons are Ritch Eich, Jackie Brown, Phil Pizzo and Paul Berg

1. Communication Initiative

To communicate the medical school's excellence and accomplishments in education, patient care and research, communicate a bold vision for Stanford as a global model of research-intensive medical schools for the 21st century.

2. Campaign Initiative

To advance the mission of the School of Medicine by maximizing the generation of private philanthropic support, develop a comprehensive and exciting campaign (The Campaign for Stanford Medicine) to support the realization of the school's vision.

3. Advocacy Initiative

To actively engage the public to foster an appreciation for the importance of academic medicine to the health of the community and the nation, develop an on-going and broadly-based education and advocacy program targeted to local, state and national government leaders.

4. Public Policy Initiative

To extend Stanford's expertise in health policy, health services research, health economics, and related disciplines, and to apply this expertise to education, clinical care and research programs and its public communications, create a Dean's Advisory Group

on Public Policy and Advocacy to provide balanced information and make recommendations about school-supported policy initiatives and to recommend specific contemporary health policy issue initiatives on which to provide objective information to the Stanford community and the community at-large.

Please note that our Strategic Initiatives for Information Technology, including their impact on education, research, clinical computing and administration will be organized following the retreat and will be presented subsequently.

Again, please contact any of the individuals listed above to make sure that your input is received. We are eager to learn more about how our students, faculty and staff feel about these initial initiatives.

I should also remind you that we will use February and March to further process these initiatives into a more coherent Strategic Plan. I will be communicating to you about this in early spring.

Baxter Foundation Visit

On January 22-23 we had the privilege of hosting a visit by Directors from the Donald E. and Delia B. Baxter Foundation. Stanford's association with the Baxter Foundation began nearly concurrently with the move of the School of Medicine from San Francisco to the Stanford University campus some 40 years ago. Since that time, the Baxter Foundation has helped support the career development of students, trainees and faculty and has engaged in a partnership with Stanford School of Medicine to facilitate discovery and innovation.

During the past four decades, the Baxter Foundation has contributed more than \$8.5 million in gifts encompassing support for student scholarships, the Medical Scholars Program and the Faculty Scholar Program for new assistant professors beginning their career. Each of these and other programs supported by the Baxter Foundation has had a significant impact on the careers of students and faculty and has contributed to new discoveries and programs at Stanford. This year, we also had the privilege of developing the Baxter Laboratory for Genetic Pharmacology, currently directed by Dr. Helen Blau and housed in the Department of Microbiology and Immunology.

The Baxter directors who visited with us included Mr. Don Haake, president of the Baxter Foundation along with directors Richard and Martha Haake and Jane Haake Russell. Their visit included updates on our research programs and initiatives at Stanford, presentations by medical and graduate students as well as junior faculty who have received support from the Foundation. In addition, the Trustees met with the four individuals who were selected to be the 2002 Baxter Foundation Faculty Scholars. These included:

1. **Dr. Laura Attardi**, Assistant Professor, Department of Radiation Oncology.

2. **Dr. Corinna Darian-Smith**, Assistant Professor, Department of Comparative Medicine
3. **Dr. Miriam Goodman**, Assistant Professor, Department of Molecular and Cellular Physiology.
4. **Dr. Merritt Maduke**, Assistant Professor, Department of Molecular and Cellular Physiology.

Congratulations to both past, current and future Baxter Foundation recipients and sincere appreciation to the Donald E. and Delia B. Baxter Foundation for their wonderful commitment and support for Stanford students and faculty.

Planning for Bioengineering Department Moves Forward

We are moving forward with our active planning for the Joint Department in Bioengineering with the Schools of Engineering and Medicine. The Bioengineering Executive Steering Committee, which includes Deans Pizzo and Plummer along with Drs. Jeff Koseff, James Nelson and Paul Yock, met on January 23rd to finalize the leadership and membership of the three committees that will help guide the development of the department during the next several months. The subcommittees planned include:

1. **Undergraduate Education**: Drs. Eric Roberts (SoE: Computer Sciences) and Charlie Taylor (SoM: Surgery and Mechanical Engineering) will serve as co-chairs.
2. **Graduate Education**: Drs Channing Robertson (SoE: Chemical Engineering) and Nelson Pelc (SoM: Radiology) will serve as co-chairs
3. **Academic Governance, Finance and Administration**: Drs. Curt Frank (SoE: Chemical Engineering) and Judy Swain (SoM: Medicine) will serve as co-chairs.

Beginning in early February, each of the subcommittees will begin their work with the goal of completing this next phase of the project the end of June 2002.

Announcements and Appreciation

- At the University Senate on January 24th, the Inaugural group of University Fellows in Undergraduate Education was announced. Eight new Fellows were awarded to acknowledge faculty for their dedication, skills and commitment to undergraduate education. I am very pleased to announce that **Dr. John C. Boothroyd**, Professor and Chair of the Department of Microbiology and Immunology was among the first of these eight new University Fellows and has been named The Dunlevie Family University Fellow in Undergraduate Education. Please join me in congratulating Dr. Boothroyd for this special honor.
- I am pleased to announce that based on the recommendations of his colleagues and collaborators, **Dr. Hugh McDevitt**, Professor of Microbiology and Immunology, has been appointed the Director of the Immunology Interdisciplinary Program (IDP). In addition to announcing this new role for

Hugh, I want to thank Dr. Irv Weissman for the tremendous job that he has performed in serving as Director during these past many years.

- I want to thank and acknowledge the wonderful job done by **Stanford University Medical Alliance** for orchestrating and conducting the 11th Annual Pre-Medical Student Conference that was held on Saturday, February 2nd. Attracting over 500 minority high school and college students from California and elsewhere, this important conference provided important insights on how to prepare for the application process for medical school as well as the multiple career paths open to students in medicine and research. Further improving the diversity of our students and faculty is among our highest priorities and I am deeply grateful to our students for helping to promote and enhance this important goal.

Appointments & Promotions

I am very pleased to announce the following appointments and promotions to our School of Medicine faculty;

- **Myriam Curet** has been appointed Associate Professor of Surgery at SUMC, 2/1/02-1/31/07
- **Lawrence Leung** has been promoted to Professor of Medicine (Hematology), effective 2/1/02
- **Lawrence Saidman** has been appointed Professor of Anesthesia at SUMC, 2/1/02-1/31/07
- **Pieter van der Starre** has been appointed Associate Professor of Anesthesia at SUMC, 2/1/02-1/31/07
- **Anne Villeneuve** has been promoted to Associate Professor of Developmental Biology and of Genetics, effective 2/1/02
- **Glyn Williams** has been appointed Associate Professor of Anesthesia at SUMC, 2/1/02-1/31/07

Congratulations to all.

Dean's Newsletter February 18, 2002

Appointment of New Leadership in the Department of Molecular Pharmacology

I am extremely pleased to announce that Professor Daria Mochly-Rosen has agreed to serve as the next Chair of the Department of Molecular Pharmacology beginning February 15, 2002. This is wonderful news for the Department, School and University.

Dr. Mochly-Rosen joined Stanford in 1993, having previously been an Associate Professor in Residence at UCSF. She received her Ph.D. at the Weizmann Institute's Department of Chemical Immunology and did a Postdoctoral Fellowship in the

Department of Biochemistry at Berkeley. She also served as the Reed-Hodgeson Professor in Human Biology at Stanford from 1996-2001. Dr. Mochly-Rosen's major research focus is the role of protein kinase C (PKC) in normal signal transduction and in disease. She and her colleagues have proposed that activated PKC isozymes bind to intracellular receptor proteins located at different subcellular sites, and that these receptors differentially bind specific PKC isozymes. The specific anchoring proteins are termed RACKs (for Receptors for Activated C-Kinase). Her studies to date have focused mainly on the role of PKC in heart function but her work also extends to cancer biology, as well as more broadly to a number of areas in developmental biology. They also relate to her interest in the emerging field of chemical biology.

Since last summer, Dr. Mochly-Rosen has served as the Chief of the Division of Chemical Biology. She has since developed a research theme engaging several other members of Molecular Pharmacology faculty (especially Drs. Meyer, Cimprich, and Ferrell) in developing a broader focus on chemical biology. Importantly, this research area has simultaneously been defined as one of the major research themes for the Clark Center, and thus will further link the Department of Molecular Pharmacology and the School of Medicine to an even broader Stanford University initiative.

In the years ahead Dr. Mochly-Rosen's leadership will prove important in furthering the field of molecular pharmacology and its important intersection with chemical biology. This has broad institutional implications and significance.

Please join me in congratulating Professor Daria Mochly-Rosen on becoming Chair of the Department of Molecular Pharmacology.

Next Town Hall Meeting on Monday, February 25th

On Monday, February 25th, we will hold our first Post-Retreat Strategic Planning Update at Noon in the Fairchild Auditorium. Faculty, staff and students are welcome to attend. The focus of this presentation will be on medical and graduate student education. We are interested in your input, so please attend the Town Hall Meeting at Noon on February 25th.

Strategic Planning Retreat Update

The School of Medicine held its first comprehensive Strategic Planning Retreat from February 8-10th. Attending the Retreat were the Chairs of Basic and Clinical Science Departments, Faculty Leaders, Senior Deans, staff, medical and graduate students and postdoctoral fellows. Also in attendance were the President/CEOs from Stanford Hospital & Clinics and the Lucile Packard Children's Hospital, Trustee(s) and the Provost. In total, we had 72 participants spanning our missions in education, research and patient care.

The weekend Retreat was both an ending and a beginning. Leading up to the Retreat nine Work Groups comprised of more than a hundred faculty, students and staff from throughout the School, who had been working since September 2001, each under the guidance of a Senior Dean, analyzing various aspects of our missions. These work groups produced over 100 potential Strategic Initiatives, of which approximately 20 were selected for presentation and discussion at the Retreat (these were published in the February 4th edition of the Dean's Newsletter). To foster as much dialogue and debate as possible, participants received a detailed briefing document prior to the Retreat which included, for each Work Group, a program summary, mission and goals, SWOT (strength, weakness, opportunity and threats) analysis, and a review of proposed initiatives.

The presentations and discussions at the Retreat were done before the entire group of attendees. We purposefully decided not to use any outside consultants or facilitators for either the planning or presentation phase of this process. David O'Brien served as the Internal Coordinator of the planning process and the Dean served as the facilitator at the Retreat. The format for the retreat was as follows:

Friday, February 8th

1. Medical Student Education: Dr. Julie Parsonnet
2. Graduate Student Education: Dr. Karla Kirkegaard and James Nelson
3. Postdoctoral Education: Dr. Joe Lipsick

Saturday, February 9th.

1. Research Programs: Dr. James Nelson
2. Clinical Programs: Drs. Norm Rizk and Ken Cox
3. The Professoriate: Dr. David Stevenson
4. Finance & Administration: Mr. Michael Hindery
5. Communication, Advocacy, Public Policy & Philanthropy: Dr. Phil Pizzo

Sunday, February 10th

1. Summary: Dr. Phil Pizzo
2. General Discussion and Review

It is important to underscore that this first phase of our Strategic Planning effort was primarily an opportunity to assess the proposed direction of individual areas (e.g., education, research, clinical care) as well as to evaluate their interrelationships. Because academic medical centers like Stanford have multiple missions, I felt it was particularly important at this stage to determine the degrees of alignment between and among our missions and community. We also wanted to determine how each fit into our overarching mission, which we had defined prior to the Retreat "to be a premier research-intensive School of Medicine that improves health in the 21st Century through discoveries, leadership and innovations in education, biomedical and clinical research and patient care".

Despite the differences in culture and focus among the various attendees of the Retreat, and whatever preconceived perceptions or attitudes that each held prior to her or his arrival, a remarkable degree of agreement and consonance was achieved during and certainly by the conclusion of the Retreat. Perhaps most importantly, the intricate interrelatedness and dependency of our missions became increasingly clear to all participants. So too did the important connections and synergies.

The unifying theme for our missions and School is Translational Research and Medicine. The linkage between basic and clinical science, the relationship between basic research, discovery and innovation and their impact on human health, the importance of training medical and graduate students to explore the intersections of science and health are essential components of Translational Research and Medicine at Stanford. So too is being excellent in our research, education and clinical care. Further, valuing the importance of outstanding patient care and the role of superb clinicians, teachers and scholars was felt to be as essential to fostering Translational Research and Medicine at Stanford as is the presence of outstanding investigators.

In the coming weeks we will be further refining the reports of the Work Groups, now informed by the discussion that took place at the Retreat, into a comprehensive Strategic Planning document and series of action items. As previously forecast, I anticipate that the Planning Report, which will still be a work-in-progress, will be available by early April. We will also be initiating an Internal Web Page so that you can access the reports and offer your input and comments on-line. At the same time, we will soon be coming forth with the initiatives that have emerged from the work-to-date that will be ready for implementation immediately or that will be staged for implementation over the next several years.

Because each Work Group and mission area has a number of important initiatives (some of which I detailed in the February 4th Dean's Newsletter) I do not intend to summarize them now, for fear of reducing them to too much simplicity. We will plan to present them each in more detail, beginning with Education at the Town Hall Meeting on February 25th at Noon in the Fairchild Auditorium.

I do want to take a moment to thank the many faculty, students and staff who have already spent a considerable number of hours working on the Strategic Plan. I want to particularly thank those who gave up so much time to attend the Strategic Planning Retreat on February 8-10th. During the next months we will be holding more focused Mini-Retreats on campus addressing key mission areas, and I hope that you will be able to attend those as they are announced. Our ultimate success will be dependent on the engagement and involvement of our faculty, students and staff and their sense of ownership and commitment to the plans that emerge from shared efforts. As always, I am most interested to receive your input.

Appointment of Director of the School of Medicine's New Institutional Planning Office

Strategic plans are not new to the School of Medicine. Others have preceded the effort currently underway and many contained valuable insights and initiatives. However, most of these plans have not been realized or implemented.

While strategic planning is important, the follow-up and implementation of the defined initiative is even more critical. Indeed, a lack of follow through results in apathy and cynicism, making it even more difficult to engage change. This is especially true when change requires the involvement of many individuals; not infrequently individuals sharing different goals and objectives.

Recognizing the importance of ownership over a strategic planning process, I have quite purposefully assumed personal responsibility for the efforts to date and have made sure that the strategic planning to date has occurred internally. Surely this does not mean that we will not at some point, wish to seek external review to further test and refine our ideas and initiatives. However, at this juncture it seems wisest to keep our planning operations internal.

To assure that our strategic planning efforts are managed and achieved as optimally as possible, however, I have, with the concurrence of our Senior Associate Deans, decided to establish an Office of Institutional Planning at the School of Medicine. I am pleased to announce that Mr. David O'Brien, who has played a key role in coordinating and overseeing the current Strategic Plan, will become Director of the School's Institutional Planning Office. In his new role, Mr. O'Brien will report to the Dean and work closely with the Senior Deans as well as faculty, students and staff. Importantly, Mr. O'Brien will help assure that our initiatives are tracked and implemented and that in the years ahead our vision and goals for Stanford University School of Medicine are realized.

Input Being Sought on Bioengineering

As you know from prior communications, the Schools of Engineering and Medicine are moving forward in forming a joint bioengineering department. Our goal is to get Advisory Board and Board of Trustees approval for this new department by June, 2002. As I announced in the February 4th Dean's Newsletter, three committees have been formed and are being lead by co-chairs from engineering and medicine. These committees include Undergraduate Programs (Co-Chairs are Eric Roberts and Charles Taylor); Graduate Education and Research (Co-Chairs are Channing Robertson and Norbert Pelc) and Finance/Administration (Co-Chairs are Curt Frank and Judy Swain). Email addresses are listed below for each of these co-chairs.

Jim Plummer, Dean of the School of Engineering, and I very much encourage **your** input into the ongoing planning process. Specifically, any ideas and opinions that you have regarding undergraduate programs, graduate programs, department organization and mission, or other related issues, in bioengineering would be welcome by these committees. You can reach the co-chairs by email at:

eroberts@CS.stanford.edu, taylorca@stanford.edu, chanbo@stanford.edu, pelc@stanford.edu, curt@chemeng.Stanford.EDU, jlswain@stanford.edu

Emails to the co-chairs of the committees, discussions with them or with the committees as a whole, or any other means you might want to use to provide input would be welcome. The co-chairs can also provide you with a complete listing of the other faculty on each committee. We also plan to hold a series of open town hall meetings over the next few months to discuss progress on these issues and we will keep you informed about when these meetings will be held.

Meeting Faculty, Students and Staff

During my first ten months at the School of Medicine I have had the opportunity to meet with numerous faculty, students, and staff. Some have been through one-on-one meetings, others at departmental meetings or functions. Being cognizant that there are often layers separating the Dean's Office from the community that defines the School, I am seeking additional ways of enhancing direct interactions. My motivations are to get to know you better and to learn more directly about the issues or concerns that you have about the School, Medical Center and University. I am also eager to find ways to receive information directly from faculty, students and staff in addition to that which comes via reports from Chairs, Deans or Departmental leaders.

For some months I have been hosting informal (simple) lunch meetings with medical and graduate students. I am now planning to extend those meetings to faculty. Soon other Senior Deans and I will be arranging informal meetings with staff as well. The fare for the informal faculty lunches will be simple, the size less than fourteen at a time, the groups mixed, the talk direct and candid, and the agenda set by those who choose to attend. If you are interested in attending one of these informal lunch meetings please contact Ms Sharon Olsen at sharon.olsen@Stanford.EDU.

Appointments and Promotions.

I am pleased to report the following promotions recommended by the Advisory Board:

Ben A. Barres has been recommended to be promoted to Professor of Neurobiology and of Developmental Biology, effective March 1, 2002

Carol Clayberger has been recommended to be promoted to Professor of Pediatrics and of Cardiothoracic Surgery (Research), 3/1/02-2/29/08

Congratulations to Drs Barres and Clayberger.

Dean's Newsletter

March 4, 2002

Loss of a Most Valued Stanford Medicine Friend and Supporter

On February 26, 2002, Dr. Jess Shenson, a most valued friend and supporter of Stanford Medicine, succumbed to a long-standing illness. Dr. Jess Shenson, who retired from practice in 1995, and his late brother, Ben, served on Stanford's clinical faculty when the medical school was located in San Francisco. In 1950, Ben and Jess Shenson established a fund to assist meritorious students at Stanford; the name of the fund was changed to the Louis and Rose Shenson Memorial Loan Fund in 1984. In 1985, the Shenson also established the Drs. Ben and A. Jess Shenson Visiting Professorship of Clinical Medicine. And, now in perpetuity, is the Drs. Ben and A. Jess Shenson Professor in the School of Medicine, currently held by Dr. Charlotte D. Jacobs, Department of Medicine. Dr. Shenson has been a longtime supporter of the arts in San Francisco. In April 1994, he received the Stanford Medical Alumni Association's Distinguished Service Award.

On a more personal note, I had the privilege of meeting Dr. Shenson on a number of occasions since I joined the Stanford community and deeply admired his grace, dignity and heart felt commitment and concern about Stanford Medicine, both past and future. More than his monetary support has been his personal commitment to Stanford and the hope that we will continue to be excellent, especially in the clinical training of our students. As we remember his many contributions, we should constantly strive to fulfill his hopes for the future of Stanford Medicine.

Appointment of Senior Associate Dean for Information Resources and Technology

I am extremely pleased to announce the appointment of Dr. Henry Lowe as the Senior Associate Dean for Information Resources and Technology. This is a new position in the Dean's office and its initiation recognizes the importance of creating and implementing overall strategic information technology plans for the School of Medicine. This is essential to our strategic plans in education, research and clinical care and is fundamental to achieving our overarching goal of preeminence in translational research and medicine.

Among the goals for this new position are:

1. Creating an information technology environment that optimizes our success as a leading research-intensive School of Medicine, better integrating the School's information technology programs with those of the University and hospitals.

2. Developing, in partnership with the hospitals, departments and faculty, a strategy to facilitate the use of clinical data in support of translational research while protecting patient privacy and confidentiality.
3. Taking advantage of the School's unique position in the Silicon Valley to establish partnerships and innovative programs with industry.
4. Advising the School on the educational, research, clinical and administrative information system needs with regard to network resources, technical maintenance, technical innovation and relations with business partners.
5. Overseeing the direction of the medical library and its informatics functions including traditional library services, informatics, electronic publishing; working closely with University ITSS, departmental information systems staff, and the hospital CIO.
6. Work with University ITSS, departmental information systems staff and the Stanford Hospital and Clinics (SHC) and Lucille Packard Children's Hospital (LPCH) information officers to draft technology standards and work with University Purchasing to find the most cost effective procurement plan.
7. Providing application development for global initiatives taking advantage of School of Medicine standards such as School web site development and administration application development (research and financial).

Dr. Lowe is well qualified to assume this important new position. A graduate of the University College, Dublin, Ireland, Dr. Lowe did residency training in Ireland as well as at the New England Medical Center in Boston. He completed a Clinical and Research Fellowship in Medicine and Informatics at Harvard Medical School and the Massachusetts General Hospital in 1989. For the past nine years he was on the faculty at the University of Pittsburgh, where he served in various important positions, including as Director of the Clinical Multimedia Laboratory in the Center for Biomedical Informatics and Director of the Benedum Oncology Informatics Center. Dr. Lowe joined Stanford in the Fall of 2001 as Director of Cancer Informatics and Associate Professor of Medicine.

Dr. Lowe assumed his new responsibilities as Senior Associate Dean for Information Resources and Technology on March 1st. He will spend approximately 60% of his time focusing on the issues noted above and will also continue his research in medical informatics.

Please join me in welcoming Dr. Lowe to his new and important role. In subsequent issues I will update you on the team that Dr. Lowe will assemble and the progress he makes in developing our information resources and technology at Stanford School of Medicine.

Update on the School of Medicine Strategic Plan and Education in Particular

Since the Strategic Planning Retreat of February 8-10th, numerous faculty, students and staff have been busily moving forward with the implementation of various high priority strategic initiatives that we have identified during the past nine months. At the Executive

Committee on Friday March 1st, David O'Brien, our new Director of Institutional Planning, displayed the 97 strategic initiatives identified to date (absent from these are the important plans regarding Information Resources and Technology which are yet to be developed as noted above). These initiatives cut across each of our missions and have now been prioritized according to their respective planning vs. implementation phase as well as their time-line. Currently we are tracking initiatives that will unfold during the next one to two years as well as others that will occur over the next 5-10 years. Of these, we are focussing particular attention in this current academic and fiscal year on education, and on the necessary changes in finance and administration that will help to fulfill them. I will highlight some of the education initiatives below. We are planning to review the principles that will guide changes in the School's Operating Budget at the Executive Committee Meeting on March 15th.

We also reviewed again the latest draft version of our mission statement based on additional feedback that we have received following the Retreat. Based on this, and the discussion that took place at the March 1st Executive Committee meeting.

The School of Medicine Mission Statement is:

To be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovations in patient care, education and research.

As always, your comments or suggestions are welcome and can be sent to deansnewsletter@med.Stanford.edu

Update on Education

At the Town Hall Meeting on Monday February 25th, Drs. Julie Parsonnet and Karla Kirkegaard reviewed respectively an update on the Strategic Plans for Medical Student and Graduate Student Education.

Noting that strengths of Stanford's medical education are the opportunities afforded students for individual and cross-disciplinary work, Dr. Parsonnet also pointed out that there has long been an absence of curricular definition, especially the specific knowledge and skill which medical students need to have to be successful. She further noted that there is insufficient time devoted to fostering independent research skills as well as to developing clinical skills. Approaching these challenges is made difficult because neither financial support or incentives are aligned to enhance or improve teaching excellence, innovation and interdisciplinary programs. In order to address these opportunities and challenges, Dr Parsonnet and her Work Group have proposed to:

1. Identify the core knowledge and skills necessary for all students.
2. Develop required majors ("scholarly tracks") for all students to enhance independent research capabilities. These tracks should be rigorous and include curricula,

mentoring and opportunities for individual development, including, where appropriate, joint degree programs.

3. Expand the clinical curriculum, particularly in the first years of medical school, to enhance pattern recognition.
4. Develop a system of incentives to promote curricular change

The need to make these changes is also based on the awareness that the current curricula does not have sufficient emphasis on methods for acquiring and interpreting new information, on using innovative education technologies (e.g., simulations, small group interactive learning, on-line learning) and, perhaps most importantly, on bridging the gap between the basic and clinical sciences.

Based on this, a work-in-progress schema that reflects the proposed changes in the Stanford Medicine curricula is shown below:

In the new Stanford Medicine Curricula, students would be exposed to basic science and clinical medicine through all years of medical school. They would also have a core program of expected knowledge coupled with considerable individual flexibility. A

distinguishing feature would be the majors or scholarly tracks referred to above, that would extend throughout medical school, and which would meet the individual student needs for specific career development. As examples, such tracks could be in areas like clinical research or molecular medicine as well as in bioengineering or in public service or health economics. Some of these tracks would carry joint MD/PhD degrees while others could permit joint degrees in Engineering, Law, Business, Education or Humanities and Sciences. These tracks will require partnerships with other Schools at Stanford and will open a dialogue regarding undergraduate education and especially the future role of “traditional premedical education”. In addition, because of the relationship of the Medical School to the Hospital programs, the possibility for continued training during residency, fellowship and postdoctoral training are all areas for future exploration.

To address the initial phases of the medical student curricula reform, Dr. Parsonnet will work in partnership with the School of Medicine Faculty Senate as well as with faculty, staff and students. She welcomes individuals who are willing and interested to work on this important new agenda.

Equally important are our programs in Graduate Education. Dr. Karla Kirkegaard, along with Tim Stearns and James Nelson, has been leading this effort. Stanford is one of a few medical schools that have as many graduate students as it does medical students. Currently there are approximately 445 graduate students enrolled in 12 departmental and interdepartmental programs. While the current programs are excellent there is reasonable consensus that changes in our programs are necessary to enable our students to prepare for new and evolving jobs and careers in the future. As with medical students, these may require joint education and training in other disciplines, including Law, Business, and Education among others. Further the opportunities for interdisciplinary training are significant and provoke the need for cross-disciplinary inquiry and research. To help promote this, Dr. Kirkegaard and colleagues are planning a “pre-differentiation camp” that will be held this Fall (i.e., 2002), and that will enable incoming graduate students to be exposed to a wide variety of faculty, programs and potential areas for future engagement. Equally importantly, this will help to build a community of graduate students. A further important goal shared by Drs. Parsonnet and Kirkegaard is to have shared activities between incoming medical and graduate students, this likely beginning in the Fall of 2003.

A unique and important initiative is to enhance the education and training of graduate students about clinical medicine in health and disease. To fulfill our overarching goal of fostering translational research and medicine, promoting interactions of medical and graduate students will be important along with exposure to simulation and technology resources that permit graduate students to better understand mechanisms of disease.

Accomplishing the education of future medical and graduate students requires new learning and information facilities. A major objective therefore will be planning and then building of these new facilities. Based on the current refinement of our curricula objectives, it is now appropriate to begin the programmatic planning for these new facilities. Our timeline is to complete that planning over the course of the next year and to

initiate the plans for building thereafter. This is clearly a process that will take five years to complete, even on an optimal schedule. Hence, making continued improvements in our now quite outmoded facilities is still necessary, especially if we are to optimize our ability to achieve the changes discussed above.

Another key goal addressed by Dr. Kirkegaard and her colleagues is improving diversity among the graduate student class. This imperative is also widely shared and will be proactively pursued during this and future years.

In sum, we are developing bold and ambitious initiatives for medical and graduate student education. Accomplishing these will require the participation of faculty, students and staff. They will also require considerable resources, these being even more necessary given the limitations of time that virtually every member of our community currently shares. Developing those resources, for our education programs and others must also be one of our highest institutional priorities. It will surely be one of mine.

Hospital and Medical Center Updates

Evidence of improvement in the financial performance of Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital was evident at the Board of Directors Meeting held on Wednesday, February 27th. Both hospitals are doing significantly better than last year (FY01) and both are currently ahead of their FY02 budgets. While these improvements are welcome, and reflect the enormous work, accomplishments and sacrifice of hospital administration, faculty and staff, for which we must all be deeply appreciative and complimentary, they will require continued significant effort to sustain and enhance. This is especially true for SHC, which while ahead of budget currently, still projects a deficit for FY02, although hopefully the last such negative year.

That said, the health care financial landscape remains very complex and challenged nationwide, and especially in northern California. Patient care payments from providers are the lowest in the nation in the Bay Area, and despite the contracting improvements of the past year, still pay below cost. Further complicating this are the low reimbursements from Medicare and MediCal. Teaching hospitals like those associated with Stanford School of Medicine also have inherent inefficiencies related to the time necessary to teach medical students, residents and fellows. Together, this poses a major set of difficulties. These are made even more so when beds are filled as they are presently and resources strained.

The next big transition for the Medical Center will begin when the new President and CEO, Ms. Martha Marsh arrives officially on April 2nd. Ms. Marsh attended the Board of Directors meeting this past week as a guest and is beginning to learn more about the medical center and is developing her plans for SHC. We all welcome her with anticipation and enthusiasm. Given the recent improvements in the hospital's financial performance, we are optimistic that significant additional progress will be made under the leadership of Ms. Marsh.

BioX Interdisciplinary Initiatives Symposium

On Friday March 1st, the Bio-X Interdisciplinary Initiatives Symposium was held in the Fairchild Auditorium. Bio-X brings together programs in bioengineering, biomedicine and biosciences at Stanford. It represents new opportunities of discovery and teaching between and among biologists, chemists, physicists, computer scientists, engineers and medical scientists. The Symposium was led by Dr. Harvey Cohen, Professor and Chair of the Department of Pediatrics who also served as the Chair of the Bio-X interdisciplinary Initiatives Committee that included Axel Brunger (Molecular & Cell Physiology), Scott Delp (Mechanical Engineering), Gerald Fuller (Chemical Engineering), Gary Glazer (Radiology), Keith Hodgson (Chemistry), Jeff Koseff (Civil & Environmental Engineering), Suzanne Pfeffer (Biochemistry), Ken Salisbury (Computer Sciences), Lucy Shapiro (Developmental Biology), Judy Swain (Medicine) and Richard Zare (Chemistry).

A cross section of presentations of topics aligning investigators from different disciplines and different schools presented reports both basic and clinical, theoretical and applied. Truly a new paradigm for research and education is being created at Stanford thanks to this effort and the support that allowed these initiatives to move forward.

Avery Professorship Celebration

On Wednesday evening February 26th, Burt and Marion Avery, their four children and families gathered to celebrate Mark Davis, the new incumbent of the Burt and Marion Avery Professorship in Immunology. The Avery family represents three generations at Stanford and 11 graduates. They are committed to fostering interdisciplinary research and have viewed immunology as epitomizing that thrust. The past incumbent of the Avery Professorship was Dr. Hugh McDevitt, Professor of Microbiology and Immunology.

Dr. Davis is a Professor in the Department of Microbiology and Immunology, a Member of HHMI and internationally recognized for his work on the T-cell receptor and immunology. He is also the recipient of numerous awards and honors, including the King Faisal International Prize in Medicine, the Alfred P. Sloan Prize from the General Motors Cancer Research Foundation, the Behring-Heidelberger Prize, and the Pius XI Award from the Pontifical Academy of Sciences.

Please join me in congratulating Professor Mark Davis.

Appointments and Promotions

I am pleased to announce that **Maurice Ohayon** has been appointed Associate Professor of Psychiatry and Behavioral Sciences (Research), 3/1/02-2/28/07

Dean's Newsletter

March 18, 2002

Executive Committee Update: Current and Future Operating Budgets

As part of our Strategic Planning Process we recognized the importance of addressing those ways in which the School's administrative and financial infrastructure could best serve and facilitate the fulfillment of our missions in education, research and patient care. Accordingly, one of the nine Work Groups focused on Administration and Finance. As part of this effort, led by Mike Hindery, Senior Associate Dean for Administration and Finance, of the methodology for the School's Operating Budget was reviewed. Although the operating budget comprises only a portion of the consolidated budget for the School and its Departments, it does have an impact on the School's current and future programs. Indeed, one of the factors often blamed for impeding progress in curriculum reform in the past has been the current operating budget formula, which has been in place for more than two decades. While that formula is simple, predictive and longstanding, it may also inadvertently impede the development of curriculum evolution, including interdisciplinary education and interdisciplinary research, both of which are central to the future of the School of Medicine.

Based on this, the principles guiding a change in the operating formula are that:

- It should be fair, equitable, transparent and simple to calculate.
- The funds available for distribution and the formula are income driven.
- The methodology should respect and preserve the School's history with formulae.
- The formula should incent the management of costs and the enhancement of revenue.
- The formula should respect local control of decisions and should permit units and departments to understand the impact of decisions.
- The formula should incent the appropriate use of restricted funds.
- The formula should recognize the importance of teachers, including interdepartmental teaching and courses.
- The formula should be flexible enough to accommodate changing organizational models and interdisciplinary units.

At the School's Executive Committee meeting held on Friday, March 15th, Mr. Hindery gave an overview of the School of Medicine's financial status and then focused on the changes in the operating budget currently under consideration. Departmental DFA's were also invited to this special presentation. Among the most important elements of the revision in the operating budget is the creation of a "teaching fund" that will help to help pay for basic science and clinical courses and electives and that will also incent

excellence in courses and teachers.

The presentation engendered a lively and very productive discussion. Coupled with changes to the operating budget will also be a new School of Medicine Reserves Policy that will impact both the School and the Departments. The Reserves Policy has been under review by a committee chaired by Mike Hindery that has been working since early last Fall and that will be ready for a presentation to the Executive Committee in the next month. The Reserves Policy delineate the responsibility and allocation of expenses for education, research and infrastructure support between the Departments or School (i.e., Dean's Office). The changes to the Operating Budget, coupled with the new Reserves Policy, will have important implications for the School and the Departments. Obviously, the key goal is to help facilitate improvements in our ability to enhance our programs in education, research and patient care.

Not yet finalized is the timing for introduction of these changes. Because the preparations for the FY03 budget cycle commence during the next two weeks, it is unclear whether we will be ready to make the necessary refinements to permit introduction of the revised Operating Budget Formula and new Reserves Policy this immediate budget cycle or whether we will need to defer to the next budget cycle. Either way, we **will** be making changes to the Operating Budget and Reserves Policies to further improve our ability to make progress in important mission critical areas. At the same time, we also recognize that whatever changes we make, additional funding sources are necessary to permit us to achieve our goals, making the Campaign for Stanford Medicine all the more critical and important.

Important Reminder Regarding Email Usage in the Workplace

During the past decade Email has become one of the best-used communication tools in the workplace. The use of this tool, however, requires special attention and responsibility. Email correspondence is public and easily accessible. Its rapidity and ease of distribution can be a great benefit as well as source of problems. Accordingly, I want to remind each member of our community to be responsible, thoughtful and appropriate in the use of email in the workplace.

I am aware of recent correspondence that has been unnecessarily inflammatory and which in some cases included inaccurate comments or allegations. Such documents can undermine our professional workplace and impede our goal to have an environment that is collegial, responsible and thoughtful. Please exercise appropriate judgment when using email, especially when a number of individuals are being copied. It is always wise to pause before pressing the send button and be sure that the implications of messages being sent have been fully considered.

Thank you for your attention to this important issue.

Associate Dean of Learning Technologies

I am pleased to announce that Dr. Parvati Dev will soon assume the responsibilities for Associate Dean of Learning Technologies, working with Dr. Henry Lowe, the recently appointed Senior Associate Dean for Information Resources and Technology. Dr. Dev is extremely qualified for this role based on the leadership she has provided as Director of the SUMMIT Program since 1990. Dr. Dev received her PhD in Electrical Engineering from Stanford and has focused her efforts on the interface of medical education and information technology and learning for more than a decade. She has received a number of awards for the pioneering work that has emerged under her leadership. I am extremely pleased she will assume these additional responsibilities.

On the Road Again

On March 7-9th, I joined our Alumni and Medical Development staff in a series of “On the Road Events” in San Diego and Los Angeles. These events are designed to promote greater contact with graduates from the School of Medicine training programs. They offer an opportunity to provide updates about our new strategic initiatives at Stanford, as well as act as a forum for graduates and alumni to reunite with other members of the Stanford community.

I want to thank the speakers at our “On the Road Symposium” held on Saturday, March 9th, in Santa Monica. They included Professors Peter Small, Scott Mitchell and Irv Weissman. Each gave excellent presentations underscoring the continuing role of Stanford in innovation, discovery and translational research. Importantly the work presented also addressed the role of Stanford as a leader both nationally and globally.

Congratulations to Medical Student Awardees

I am very pleased to share that a number of our medical students have recently been the recipients of prestigious awards.

Tonya Nichols SMS 2 was awarded a Metropolitan Life Foundation Scholars, National Medical Fellowship, Inc. This scholarship is presented annually to underrepresented minority students in recognition of outstanding academic achievement, leadership, community involvement and potential for distinguished contributions to medicine. Tonya was one of 16 students selected nationally.

Sarah Carranza, SMS 3, Richard Rubio, SMS 4 and Melanie Watkins, SMS were selected as Community Service Scholars, National Medical Fellowship, Inc. This award allows its recipients to work at community based health care agencies in the Bay Area where they learn more about community-based primary care, its philosophy and practice. The honor recognizes a demonstrated commitment to practicing in the Bay Area. Students will assist in direct patient care, community epidemiology and health education with selected mentors.

Congratulations to Dr. Jack Remington

The Department of Medicine recently announced that Jack Remington, Professor of Medicine in the Division of Infectious Diseases and Geographic Medicine has been selected as the recipient of the Albion Walter Hewlett Award. This award was established in 1983 in honor of Dr. Albion Walter Hewlett who served as a Professor of Medicine at Stanford from 1916 through the time of his death in 1925. This annual award, as determined by the Faculty in the Department of Medicine, recognizes “the physician of care and skill who is committed to discovering and using biologic knowledge, wisdom and compassion to return patients to productive lives.” According to the guidelines, “Nominees should be living physicians who have some Stanford background and are well known here as dynamic role models for future academicians and practitioners of scientific medicine.”

I have had the personal privilege of knowing Jack Remington for 25 years and commend both him and the faculty for their choice. Dr. Remington will also present Grand Rounds on Thursday May 23, 2002 at 8:00 a.m. in the Fairchild Auditorium as part of the Award Ceremony.

Announcement: A Novel CME Program

I would like to bring to your attention a novel, interdisciplinary CME program to be held on May 3, 2002 at the NIH. The conference, sponsored by Stanford University and the Lymphatic Research Foundation, will address “The Lymphatic Continuum”. For more information, please see <http://www.lymphaticresearch.org/LRF/index.html>.

Appointments and Promotions

I am pleased to announce the following appointments and reappointments.

Craig Garner has been appointed Professor of Psychiatry and Behavioral Sciences and, by courtesy, of Neurology and Neurological Sciences, effective April 1, 2002

Dr. Laura Lazzeroni has been reappointed Assistant Professor (Research) of Health Research and Policy.

Congratulations.

Dean's Newsletter

April 1, 2002

One Year - Already

It is, at least for me, hard to believe that tomorrow, April 2nd, is the beginning of my second year as Dean of the School of Medicine. In some ways, it continues to feel like I have only just arrived. At the same time, so much has taken place during the past twelve months. Perhaps most importantly, we have worked together to affirm the mission of our school for the 21st Century and have developed an impressive array of strategic initiatives that will, when fully implemented, shape the future of Stanford Medicine for many years to come. The blueprints of our Strategic Plan are being finalized and our future course in education, research, and patient care are being charted. Although the time ahead is full of challenges, we have the opportunity to make special contributions that will help redefine the future of academic medicine.

It is important to acknowledge that whatever success and progress we have made during the past year resides with the efforts of the many faculty leaders, students, staff and volunteers who have worked so hard on behalf of the School. This was not only evident during the Strategic Planning process, but remains so, virtually every day, in so many different ways. I would especially like to thank the members of our Dean's Office, particularly our Senior Associate Deans as well as Department Chairs, Faculty Senate Members, Student Leaders and the exceptional staff who have worked so hard on behalf of the School and University. Coupled with the outstanding contributions being made in basic and clinical research, in teaching and in the delivery of superlative patient care, it is no surprise that Stanford is such a wonderful place.

I also want to thank you for being so welcoming and let you know how much I look forward to continuing to work with you for the future of Stanford Medicine in the years ahead.

Arrival of Martha Marsh, new SHC President and CEO

I am very pleased to note that April 2nd is also the starting date for Ms. Martha Marsh, the new President and Chief Executive Officer for Stanford Hospital & Clinics (SHC). We have been eagerly anticipating the arrival of a permanent CEO for SHC since late last spring. The arrival of Ms. Marsh, who was selected through a national search, is an important milestone. We all look forward to working closely with Ms. Marsh who, together with the CEO of Packard Children's Hospital and the Dean, will form the leadership group for the Medical Center.

In announcing Ms. Marsh's arrival, it is also worthy of comment that the financial reports from both SHC and LPCH are considerably better than a year ago. Indeed, LPCH is operating well ahead of budget and is currently on track to have a slight positive operating margin, which is great news. SHC is ahead of budget, and although a loss of

operations is still forecast, it appears better than anticipated, hopefully, the budget will achieve break-even during the forth quarter of this year. Obviously this progress is a tribute to the Hospital staff and administration as well as the faculty.

While there are many challenges ahead, the financial performance of both hospitals is better than a year ago and the arrival of a new CEO offers much promise for an ever more successful future.

Match Day Successes

I want to extend my congratulations and best wishes, once again, to our Stanford Medical students who received the their Match results on Thursday, March 21st. This annual ritual, which is filled with expectation and anxiety for students and program directors, is announced at the same moment nation wide. At 9am PST, students received, in random order, an envelope containing the name of the training program to which they had matched. As in past years, Stanford students did very well in the Match, with more than 90% receiving one of their top three choices. The 2002 Match List is attached (Sharon, can this be done as an attachment or link)

This year's Match reflected some national trends. As reported by the AAMC, a number of primary care areas, including internal medicine, family medicine and pediatrics, received fewer applicants this year than in the past. This largely reflects the perception and reality that positions in primary care are increasingly difficult to find at the completion of training. Of note, the number of students seeking training in general surgery also continues to decline, perhaps reflecting perceptions about the work challenges of a residency in surgery. Naturally these issues will need attention in order to sustain the competitiveness and desirability of these training programs.

The news at Stanford was outstanding for both students and residency programs. The top five areas, which comprised 68% of those chosen, included Internal Medicine (25%), General Surgery and Surgical Specialties (16%), Pediatrics (10%), Radiology (9%) and Dermatology (8%). The remaining areas matched by our students included Anesthesia, Emergency Medicine, Family Medicine, Neurology, Pathology, Psychiatry, Physical Medicine and Rehabilitation. Although our students will seek residencies in numerous programs, nearly a third will remain at Stanford programs with the next largest contingent, (~16%) joining Harvard-affiliated programs in Boston.

Again, congratulations to all of our students. Next step is graduation!

Stanford Medical Student Gift Challenge

At the Match Day Dinner Celebration, the class of 2002 presented a gift representing contributions from more than 80% of the graduating students. Achieving this number triggers matching from an alumnae contribution - which is wonderful for the Class,

Alumni and the School. The Committee that spearheaded this effort included Lyn Aborn, Eunice Mata, Joel Mata, Amy Markezich, Melissa Minor, Ward Myers, Sarah Schmidt, Clement Yeh and Heidi Witherell. This year's graduating students elected a Cornerstone gift for our new Learning and Information Center.

We are all very appreciative to the Class of 2002 for their many contributions to Stanford, including this wonderful Cornerstone gift.

Strategic Planning Update

Work on all parts of the Strategic Plan continues. Throughout this important process I want to keep you informed and engaged and to enlist your support and suggestions. David O'Brien, Director of our new Institutional Planning Office has been working with colleagues in MedIT to establish a Strategic Planning Web site. An early version is now available (<http://medstrategicplan.stanford.edu>) which contains all the strategic initiatives as well as the presentations that were delivered at the February 8-10th Retreat. This site will be updated to include new information and progress reports as they evolve and will also serve as a site for you to register suggestions and input. Again, the success of our programs depends on your involvement so please stay engaged.

Mark Hlatky Reappointed as Chair of the Department of Health Research and Policy

I am very pleased to inform you that Dr. Mark Hlatky, Professor of Health Research and Policy and of Medicine (CV Medicine), has agreed to serve an additional term as Chair of the Department of HRP for the period September 1, 2001 to August 31, 2004. Dr. Hlatky joined Stanford in 1989 and was promoted to Professor in 1996. His scholarly interests are outcomes research and how therapy--especially in cardiovascular medicine--affects survival, functional status, cost and cost-effectiveness. Dr. Hlatky is one of the leaders of the Donald W. Reynolds Cardiovascular Clinical Research Center, which was established in 2000 with a grant from the Reynolds Foundation to identify genetic variations that contribute to the development of coronary atherosclerosis and myocardial infarction. I am delighted that he will continue to serve HRP, the School and the University in this important leadership position.

Tribute to Dr. Mert Bernfield

On Monday night, March 25th, Dr. Mert Bernfield died in Boston at age 63 from pneumonia following a more than five-year battle with Parkinson's disease. Faculty at two universities, and colleagues and friends worldwide, mourns his death.

Dr. Bernfield had an enormously distinguished and celebrated career at Stanford as an educator, researcher, clinician and leader. He served as the second Director of the Human Biology Program, which he led with great success. In 1989 the Bernfields left Stanford

for Boston. Mert joined Harvard Medical School as the Clement Smith Professor of Pediatrics and Cell Biology and Director of the Joint Program in Neonatology at the Children's Hospital, Boston. I had the pleasure of interacting with Dr. Bernfield when I returned to Boston in 1996 but also had the sadness of noting the deterioration of his health. Despite his illness, he continued to work and make important contributions to science and medicine. Among his many enduring accomplishments is the impact he had on many young physicians and colleagues - a legacy that will surely continue to be felt in the decades that follow.

Appointments and Promotions

I am pleased to announce the following appointments and promotions.

William Talbot has been promoted to Associate Professor of Developmental Biology, effective 4/1/02.

Bertha Chen has been reappointed Assistant Professor of Gynecology and Obstetrics at the Stanford University Medical Center.

Joseph DiCarlo has been reappointed Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital at Stanford.

Eric A. Weiss has been reappointed Assistant Professor of Surgery (Emergency Medicine) at the Stanford University Medical Center.

Vinit Wellis has been reappointed Assistant Professor of Anesthesia at the Stanford University Medical Center.

Congratulations!

Dean's Newsletter

April 15, 2002

Memorial Service for Dr. Kenneth Melmon

A Memorial Service will be held on April 29th at 4:30 p.m. in the Arrillaga Alumni Center in honor and remembrance of Dr. Ken Melmon who died on Monday, April 8, 2002. All faculty, staff and students are invited to attend.

Not in the Ranking

On April 8th, US News & World Report issued its annual ranking of medical schools. This year Stanford fell from ninth to eleventh place. While this is certainly disappointing and, to the uninformed, may imply that Stanford is losing ground or, even worse, quality,

nothing could be further from the truth. The reality is that the Stanford is doing extremely well but the methodology used to determine these rankings for medical schools is highly flawed and negatively impacts on small but otherwise outstanding school like Stanford.

Among its great strengths is that Stanford is a small school (indeed, the smallest of its peer schools and only a tenth the size of Harvard, for example) with an outstanding faculty and student body. Indeed by most every metric Stanford excels. On a per capita basis, Stanford is at the very top in the amount of competitive NIH funding it receives per faculty member – a surrogate measure for overall faculty excellence. More importantly, the quality of the research at Stanford is breathtaking. Further, the advantage of a small faculty is that it promotes greater interaction and collaboration in research and increased contact and involvement with our students. However, the methodology employed by US News & World Report does not measure that excellence accurately.

Instead, US News & World Report places a very high value on the total amount of NIH funding. This obviously favors schools that have a large faculty size, many of which have also grown substantially during the past several years in order to take advantage of the doubling of the NIH budget. More faculty simply means a higher amount of funding but says nothing about the quality of the research or the amount of support per faculty member, the more important measure in which Stanford tops the list. Indeed, this is not even considered in the current ranking methodology.

The current methodology also includes faculty-student ratios as an important metric further impacting Stanford. We believe having a small but highly distinguished faculty is an advantage. Faculty-student ratios are even further distorted at Stanford since most of our students remain in medical school for five or more years, thus increasing the relative student body. However, we also believe this permits our students to learn with greater flexibility and success.

So, while acknowledging that it is disappointing to not be in the top ten this year, it is important to understand that this is simply a function of changes that have occurred in the past years that artificially influence these rankings and distort true measures of excellence. We will bring these serious methodological issues to the attention of US News & World Report with the hope that they will modify their methodology in future years. With that, I am very confident that Stanford would rise significantly in the ranks.

I am proud to be at Stanford and continue to believe that in the most important metrics of success and excellence, we are number one.

Faculty Senate Visits the School of Medicine

On Thursday, April 4th, the School of Medicine hosted the University Faculty Senate on our campus. This was the first time, since 1994, the School of Medicine made a report to the Senate and likely the first time that the Senate visited the Medical Center.

We first thought about having the Senate visit the School last summer when it became clear to me that there was a large knowledge gap about the School of Medicine, our hospitals and the overall state-of-affairs of academic medicine. Thus, I felt it would be educational and instructive to have the Faculty Senate learn more about the School and our missions in education, research and patient care. I believe that the visit was successful in accomplishing this goal but recognize that this is just one of many steps we must take to help achieve our shared goal of becoming “one University.”

The format for the visit involved a presentation on the State of the School, focusing particularly on the new directions we will be taking as a result of our Strategic Planning during this past year. I gave this presentation and highlighted our goals and strategic objectives in medical student and graduate student education, the important role of our postdoctoral scholars, the evolving nature of our research programs and their relationship to our mission in translational medicine and clinical care. I also discussed the impact of our new directions on the professoriate, highlighting how this has evolved at the School of Medicine. I concluded by describing some of our most immediate capital needs, especially our Center for Learning and Information – which was clearly evident from the fact that we held the Faculty Senate session in M104!

Following my presentation and a Q&A session, we invited Senators to participate in one of six tours:

Education

1. The Role of Information Technology and Simulation in Medical Education. Presenter: Dr. Parvati Dev and Dr. Neil Gesundheit

Translational Research in Medicine

2. Genomics and Its Application to Human Disease – Stanford Functional Genomics Facility a& Stanford Microarray Database. Presenter: Dr. Mike Fero
3. Genomics and Its Application to Human Disease – Use of Microarrays for Analysis of Events During Development. Presenter: Farhad Imam (for Dr. Mark Krasnow)
4. Delivering State-of-the-Art Imaging Resources to Researchers: The Cell Sciences Imaging Facility. Presenter: Dr. Jon Mulholland
5. 3D Clinical and Basic Sciences Laboratory. Presenters: Drs. Sandy Napel and Geoff Grubin

The Boundaries of Clinical Care

6. Neonatal Intensive Care in the 21st Century. Presenter: Dr Susan Hintz (for Dr. David Stevenson)

I hope that this visit to the Medical School provided a better portrait to our colleagues throughout the University about the important mission of our School and the important plans and initiatives we will be working toward in the years ahead.

I want to thank Ms. Bev Simmonds, Special Assistant to the Dean, for the tremendous amount of work she did to help prepare us for the visit by the Faculty Senate. I also want to thank our Senior Deans and especially our faculty, students and staff who hosted or guided tours. Thank you very much.

Review of the Children's Health Initiative

On Wednesday, April 3rd, the External Pediatric Advisory Committee visited the Lucile Packard Children's Hospital to review the progress of and developments in the Children's Health Initiative. Although the reports are still preliminary, I am pleased to say that the Committee was very impressed and pleased by the progress that has been made since the review that occurred approximately eighteen months ago. The Advisory Committee included Dr. Stephen Altschuler, President/CEO Children's Hospital of Philadelphia, Dr. Tom Boat, Chair of Pediatrics at Cincinnati Children's Hospital, Dr. Ralph Feigin, President of Baylor Medical College and Chair of Pediatrics at the Texas Children's Hospital, Dr. Doug Jones, Chair of Pediatrics at Denver Children's Hospital, and Larry McAndrews, President of the National Association of Children's Hospitals. The Committee reviewed the Center in Newborn Medicine (the Johnson Center), Heart Center, Cancer Center and Brain & Behavior. Also reviewed were the overall plans and programs at Packard Children's Hospital, including their relationship to the School of Medicine.

Numerous faculty and staff worked incredibly hard to prepare for the visit and make it successful. I want to particularly thank Dr. Alan Krensky, Director of the Children's Health Initiative, Dr. Harvey Cohen, Chair of Pediatrics, Ms. Cynthia Haines and Ms. Bonnie Whalen. I also want to thank all who presented at the visit and, especially, the leadership of Mr. Chris Dawes, President and CEO of the Lucile Packard Children's Hospital. Special thanks also must go to the Lucile Packard Foundation for Children's Health for their tremendous support for LPCH and the School of Medicine.

Of course the official written reviews will be important and more definitive. But the informal report is highly encouraging and a testament to the progress that has been made in bringing LPCH to the forefront of pediatric medicine and research.

Report on the Annual Symposium for the Arts and Humanities Scholars Program

Dr. Julie Parsonnet, Senior Associate Dean for Medical Student Education, reports that the Arts and Humanities Scholars Program's annual symposium, "Medicine and the Muse", held on April 11th at the Cantor Visual Arts Center, was a tremendous success. According to Dr. Parsonnet, Deborah Kirklin, M.D., Director for the Centre for Medical Humanities at London Royal Free & University College Medical School, opened the symposium with a moving lecture on the interconnections between medicine and the humanities before a standing-room-only crowd. Stanford medical student participants in the Arts and

Humanities Scholars Program then presented their original works in poetry, music, film, and other visual and computer-based media. It was an extraordinary display of our students' talents. Of note, many of the presenting students received funding for their work from the Arts and Humanities Scholars Program at the medical school.

Our thanks go to Audrey Shafer, M.D., of the Department of Anesthesiology, the Medical Student Steering Group (Sarah Bein, Dustin Bermudez, Kubinne Kim, Michelle Lai, Erica Metz, Shannon Moffett and Miriam Schultz) and to the Cantor Visual Arts Center for putting together this inspirational event.

Reappointment of Dr. Mary Lake Polan

I am pleased to inform you that Dr. Mary Lake Polan, Professor of Gynecology and Obstetrics, has agreed to serve an additional term as Chair of the Department of Gynecology and Obstetrics for the period September 1, 2002 to August 31, 2005.

Dr. Polan was appointed at Stanford in April 1990. Her areas of research are reproductive medicine and women's health care. Dr. Polan's research continually provides noteworthy insights into the biochemical mechanisms that control human fertility. She has served on a number of committees at the National Institutes of Health and the Institute of Medicine focusing on the future of women's health issues in this country. This year she was elected to the Council of the IOM, giving further evidence of her national stature.

Dr. Polan is a valued colleague and citizen of the School. Please join me in extending best wishes to her as she continues in this important assignment. I am delighted that she will continue to serve Gynecology and Obstetrics, the School and the University in this important leadership position.

Community Day and Outreach Events

On Sunday, April 7th, Stanford hosted its first Community Day, inviting neighbors to visit the campus, attend lectures and participate in a variety of events. The Medical Center played a prominent role in this new program, featuring exhibits on the School of Medicine, Lane Library, Stanford Health Library, Lucile Packard Children's Hospital, Stanford Hospital & Clinics and Women's Health @ Stanford.

In addition, I gave a presentation entitled "Stanford Medicine: Past Present and Future", in which I reviewed the history of medical schools in the USA and Stanford specifically, the impact of research on medicine at the beginning of the 21st century, the role that Stanford has played in the areas of disease and bioscience, the paradoxical impact of health care finance on academic medical centers and Stanford specifically and the unique

role that Stanford can play in medicine of the future – in research, education and clinical care.

I want to thank the outstanding support for Community Day that was provided by numerous members of the Medical Center Community. In acknowledging the contributions of those listed below, I recognize that I am likely missing other individuals who also volunteered at Community Day – and I naturally wish to extend my appreciation to those individuals as well.

Lane Library:

Kim Schwartz, Rikke Greenwald, John Halle, Roger Winkelman, Heidi Heilemann, Chris Stave, Pam Murnane

Lucile Packard Children's Hospital

Nancy Sanchez, Tony Norton, Terry O'Grady, Karen Porschet, Bonnie Gradstein, Felice Stonestrom, Jeri Kellond, Tashina Delisi, Judy Sorey, Diane Hughes, Bonnie Whalen, Sandra Gutknecht, Linda Todd, Rosa Maldonado, Pamela Bilz, Belinda Hernandez, Debbie Hennings, Nina Wixson, Barbara Pannoni, Susan Steakley, Alan Krensky, M.D.

Stanford Hospital & Clinics

Asian Liver Center: Ben King, Karen Wang, Jennifer Lee, Joy Chen, Haibinh Nguyen, Kristina Adachi, Stephanie Chao

Cancer Center: Erika Smith

Cardiac Services: Julie Shinn, Cindy Torrefiel, Kim Bollinger, Anna Maano, Deb Robinson, Kay Sparolini, May Wong, Nancy Dahlin, Linda Lee, Michelle Gould, Jane Borchers

Center for Integrative Medicine: Rose Ann Kushner, Jim Batterson

Community & Patient Relations: Teresa Reyna, Caryn Kunkle, Sylvia Dolce, Barbra Telynor, Francie Souza, Joan Raiter, Mildred Kent, Sarah Gruber, Jonathan Parkes, Lee Erman, Lenn Fechter, Joanne Alvarado, Sheila Kolby, Linda Whistler, Lyn Belingheri, Ellen Bond, James Bond, Jan Hepper, Charlotte Saponas, Joan Solari

Genetic Risk: Nicki Chun

Health Improvement Program: Marianne Champagne

Health Library: Nora Cain, Samantha Cain

Life Flight: Judi Wilson, Kathy Konicki, R.N., Jeffrey Pearman

Neurology: Henri Hamilton, Elizabeth Lee, Denise Ryan, Larry Jang

Physician Referral: Kathy Bettman, Sue Nikaido, Mary Dybdahl, Carol Rastrullo Stephanie Kemp, Teresa Sullivan

Rehabilitation Services: Kate Zimmerman, Prem Lalwani, Susie Quon, Yvonne Acosta

Surgery: Donna Adelman, Myriam, Curet, M.D., Yvonne Karanas, M.D.

Transplant Programs: Kathryn Gelman, Kim Standridge, Miriam Beinín, Karen Wayman

Trauma Service Janet Neff, Carol Thomsen, Karen Hoexter, Demetra Kokkinis, Grace Chen, Nora Brennan

Web Center: Tom Wilson, Katie Evans, Buffie Stark, Mattice Harris, Ed Gardner

Stanford Medical School Blood Bank

Michelle Gassaway, Jennifer Reczkowski, Diane Munkers

Women's Health @ Stanford

Ellen Lovelace, Jill Lazear, Linda Giudice, M.D.

In addition to the Community Day events, a weekend series of events was also held for the Stanford Associates Volunteers and Trustees. An address by President Hennessy was coupled with numerous presentations by faculty and university officials. I had the pleasure to participate in a panel discussion entitled the "Inside Scoop" that also included Sharon Long, Dean of the School of Humanities and Sciences and Robin Mamlet, Dean of Undergraduate Admissions and Financial Aid. The topic I addressed was "Stanford as a Model for Research Intensive Schools of Medicine: Challenges and Opportunities."

These outreach programs to both our neighboring communities and our internal Stanford community are critically important. As the transitions in academic medicine continue to unfold, our ability to communicate with those who are beneficiaries of health care as well as with those who are impacted by the managed care revolution is enormously important. Our future success as a research intensive medical school will depend on the choices we make and the priorities we set. However, they will also be impacted by the important changes taking place in both the public and private sectors regarding health care finance and the rational delivery of healthcare. The more that we can inform and engage the public, the more likely we are to enlist them in advocating for changes that will improve the lives of current and future generations.

Board of Trustees: Update on the Strategic Plan

On Monday, April 8th, the Medical Center Committee of the University Board of Trustees met and welcomed Ms. Martha Marsh, who began as President & CEO of Stanford Hospital & Clinics on April 2nd.

I gave an update to the Medical Center Committee on the Strategic Planning retreat that took place in February and the plans that are now unfolding following the last nine months of planning and implementation. Specifically, I reminded the Committee of the Mission of the School of Medicine:

To be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovation in patient care, education and research.

Based on this, we have determined that our defining character will include:

- Flexible, Informal and Non-Traditional Models for Education, Research, Clinical Programs, Faculty Activities, Administration & Organization
- Adaptability
- Translational Research and Medicine
- Focus on Quality and Excellence (Not Size)
- Commitment to Change
- Recognition of Resources Constraints

The Strategic Planning work completed to date, we have identified over 100 strategic initiatives and have now focused on a prioritized list that embraces each of our missions. Based on this, our most immediate goals will include:

Medical Student Education: The principles guiding transformation of the medical student education at Stanford have been defined and the necessary changes in curriculum re-engineering are being initiated; we are currently expecting to begin implementation in 2003. Committees to determine the essential core knowledge needed for all medical students as well as the review and delineation of “scholarly tracks” will occur during this next year. In tandem with curriculum change, the support for education and incentives for teaching are being defined and will be coupled with a major initiative to create an education endowment. Further, one of our most important needs and objectives is new facilities for education and library services; planning for our new Learning and Information Center is now beginning.

Graduate Student Education: The focus during the next year will be curriculum flexibility. We will also be evaluating the role of interdisciplinary programs in current and future training, working to increase the exposure of bioscience graduate students to clinical medicine, creating a career development center, and paying enhanced attention to increasing diversity in graduate student admissions. The need to improve facilities for education and learning will be included in the School’s plans for a new Stanford Learning and Information Center.

Postdoctoral Scholars: Recognizing that postdoctoral fellows/scholars include individuals in clinical training programs (approximately 20% of the total group) as well as postdocs who are continuing their research training and development, our objective is to assess the unique as well as shared needs of these two groups during this next year. In addition, compensation guidelines as well as delineation of the maximum duration of training will be established. Areas to be addressed also include expanding diversity, developing a career center, assessing and addressing housing needs, and critically reviewing the overall size of the postdoctoral scholar program.

Research: Recognizing that one of the most important overarching goals emanating from work to date relate to an emphasis on translational research and medicine as well as multidisciplinary initiatives, efforts are already underway to determine the resources needed to make clinical and translational research more robust. Similarly, changes in the operating budget are being worked on to facilitate greater multidisciplinary efforts and will be implemented in FY04. In order to determine key areas for investment, especially focused on translational research and medicine, a Research Retreat is planned for early Fall. A product of the Retreat will be defining new interdisciplinary areas for collaborative and translational research, building on the prototype model currently being explored around the Stanford Cancer Institute. To further enhance communications, a Research Web Site has been launched and will be further developed during the year ahead.

Clinical Care: In parallel with the research efforts listed above, the clinical strategic plans for SHC and LPCH, separately and in relation to the School and Medical Center, will be finalized during the next months in conjunction with Hospital leaders and faculty. Here, focusing on what we can do best and what distinguishes us as “Stanford” will be important. Linking this plan to those in research and education, as well as to clinical program development and quality service, will be critical. In tandem with these efforts, faculty organization and practice plan development, for both SHC and LPCH, will be completed during this next year.

Professoriate: Major initiatives already underway are focused on faculty roles and responsibilities, addressing specifically the criteria for appointment and promotion for university tenure line and medical center line faculty (MCL). In particular, a review of the MCL criteria is nearing completion. Also underway is a review of the roles and responsibilities of staff physicians and voluntary clinical faculty in relation to teaching and education of students and trainees, a process that will also be completed this year. An ongoing initiative is improvement of diversity and career development among our faculty. Reports from the Committee on Women in Medicine and Science as well as the Committee on Faculty Diversity, both initiated late last year, have now been received and are under review. Details will follow.

Information Technology: The strategic planning process for IT is being initiated with the appointment of Dr. Henry Lowe as Senior Associate Dean for Information Resources and Technology. The role of IT in education, already well advanced under the leadership of Dr. Parvati Dev, Associate Dean for Learning Technologies, as well as in research, especially clinical and translational research, will be areas of focus. In addition the relationship of IT efforts within the School to that of the hospitals will be key and addressed by the appointment of a Hospital Chief Information Officer, who will work in partnership with the School. Finally, the future of the Lane Library will be an important aspect of the Strategic Plan on IT and will figure prominently into the Learning and Information Center we will be planning during the year ahead.

Finance and Administration: The underpinnings of our success in achieving our missions in education, research and clinical care depend heavily on our organization and the funds to support various initiatives. Accordingly, changes are underway to develop a new operating budget for the School (which will be the first time this has been done in more than 20 years) that will help facilitate our mission in education as well as interdisciplinary collaboration. Additional important changes will include a new reserves policy, and a departmentally-based strategic planning process. To help keep our planning mission on track, a new Office of Institutional Planning has been created.

Advocacy, Communication, Public Policy and Philanthropy: While many of the mission-based changes described above will occur within the Stanford community, their success also depends on public and private support. Important to our success will be a robust communication strategy, community outreach, enhanced government relations and ultimately, a Capital Campaign. With this in mind we will be establishing an Office of Government Relations within the School and we will seek to enhance our communications both within and outside the University. This will be further enhanced by establishing the Stanford Medicine Leadership Council, which will be completed during the months ahead and which will play a major role in the philanthropic campaign that will be launched to help assure the future success of the Stanford School of Medicine.

All of the areas and initiatives defined above are closely related and serve as the blueprint for our future. Summaries of our progress will continue to be reported in the Newsletter.

Hospital Update: Governing Council Reviews LPCH Service Payments

At the Governing Council on Friday April 12th, Dr. Ken Cox, Senior Associate Dean for Pediatric and Obstetric Clinical Affairs and CMO at LPCH, reviewed the service payments at LPCH and how decisions about them are made. Dr. Cox described the LPCH Executive Committee that is co-chaired by him and Mr. Chris Dawes, President & CEO at LPCH. The LPCH Executive Committee includes both Hospital and Faculty Leaders and meets biweekly to review clinical programs, budgets and funds flow issues. The

LPCH Executive Committee serves as the final decision maker regarding hospital-physician resource allocation and program development.

In the area of Service Payments, Dr. Cox described the categories currently used (e.g., Essential Services, Fellow Support, Medical Direction, Program Development and Purchased Services) and delineated how funds in each of these categories are distributed among each of the clinical departments. He further indicated the support that LPCH provides for clinical operations based on the challenges in reimbursement from MediCal and the requirements of the California Children's Services. Finally, he reviewed how the funds from the Children's Health Initiative (CHI – see above) further help to support both the sustainability of programs as well as investments that will help achieve preeminence in key areas such as Newborn Medicine/Obstetrics (Johnson Center), the Heart Center, Cancer Center, Pulmonary and CF Center, Transplantation and Tissue Engineering, and Brain and Behavior Center. Dr. Cox also reviewed the CHI support that will be directed in the years ahead to Cores (e.g., Information Technology, Imaging, Biotechnology, Clinical Research, Health Policy, Prevention & Outcomes) as well as to the support of regional programs of excellence, critical clinical programs, facilities and education and training. The relationships between these various sources of support for the clinical, education and research missions of LPCH and the School of Medicine's efforts in pediatrics are important and will require careful management and judicious strategic investments during the next decade.

Congratulations to Dr. Linda Giudice

On April 2nd, family, friends and colleagues gathered to celebrate the appointment of Dr. Linda Giudice as the first incumbent of the Stanley McCormick Memorial Professorship in the School of Medicine. Dr. Giudice is internationally recognized for her research in human implantation and reproductive endocrinology and has been a member of the Stanford faculty since 1987. She received her Ph.D. from UCLA, her M.D. from Stanford and carried out her postdoctoral work at the Rockefeller University and the NIH. Dr. Giudice is the author of more than 200 original articles, reviews and book chapters, has trained more than 50 fellows and students and has received honors and awards for her work. She is the President-elect of the Society for Reproductive Endocrinology and also serves as the director of Women's Health @ Stanford, a multidisciplinary program designed to provide comprehensive health services to women across their lifespan. Her outstanding contributions in research, education, clinical care and patient advocacy make her the ideal first holder of the Stanley McCormick Memorial Professorship.

I am also pleased to announce that Dr. Giudice was selected as a Fellow by the Hedwig van Ameringen Executive Leadership in Academic Medicine (ELAM) Program for Women, a very competitive program of excellence for women in academic medicine.

Please join me in congratulating Dr. Giudice.

Appointments and Promotions

I am very pleased to announce the following appointments and promotions to our School of Medicine faculty:

- **Sandy A. Napel** has been appointed Associate Professor of Radiology and, by courtesy, of Electrical Engineering, also appointed Associate Professor, by courtesy, of Medicine (Medical Informatics), 6/1/01-5/31/04

Congratulations.

Dean's Newsletter April 29, 2002

Respect and Dignity in Our Workplace

During my first year at Stanford I have tried hard to pay particular attention to the quality and dignity of the workplace within the School of Medicine. To me, an environment that fosters our missions in education, research and patient care and that values the success and dignity of our students, faculty and staff, is of the greatest importance. All who work at Stanford deserve this and should expect such. In tandem, I have and will continue to have a zero-tolerance policy for serious infractions, including harassment and discrimination of any kind. In a very real sense we are each responsible for shaping our workplace and for assuring it is one we value. During this past year, I am told that progress has been made although more still remains to be done. Accordingly, should you have any related concerns you wish to bring to our attention, I hope you will use the resources that are available. These include:

Ms. Martha Mckee, School of Medicine Ombudsperson, (650) 498-5744

Ms. Cori Bossenberry, Director of Human Resources, School of Medicine
(650) 723-5975

Dr. David Stevenson, Senior Associate Dean for Academic Affairs,
(650) 724-6762

Dr. Julie Parsonnet, Senior Associate Dean for Medical Student Education
(650) 724-8074

Dr. James Nelson, Senior Associate Dean for Research, Graduate Student
Education and Postdoctoral Affairs, (650) 725-9722

Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, (650) 725-3906

Dr. Ken Cox, Senior Associate Dean for Pediatric and Obstetric Clinical Affairs,
(650) 725-3906

If you have a concern or question, I would encourage you to contact one of these individuals. **Your concerns will be addressed promptly since we are, as a leadership**

team, committed to doing everything we can to assure respect and dignity in our workplace.

Report from the Executive Committee: Task Force on Translational and Clinical Research

At the Executive Committee meeting on Friday, April 19th, Dr. Charles Prober, Professor of Pediatrics, gave an update on the work of the Task Force on Translational and Clinical Research, which he has chaired since it was initiated in May, 2001. The charge of the Task Force was to address the state of clinical research at Stanford and to identify what the School needs to do to support its mission in translational and clinical investigation in the decade ahead. The Task Force has included approximately 50 members, including physician-scientists, basic scientists and hospital and research administrators. Approximately ten meetings were held and over 200 person hours were invested in assessing the current state of clinical research at Stanford and in determining what is necessary to make it as robust and successful as possible.

Clinical research is currently supported through the Research Management Group (RMG), the ACCESS Program, and the Office of Sponsored Research (OSR). Although there is considerable activity (e.g., ~320 active Clinical Trial Contracts, ~500 research coordinators) there is no central or focused coordination. Clearly this has raised the question of whether the overall clinical research efforts would be better optimized by greater institutional coordination and investment. Accordingly, the Task Force has made a number of recommendations, including those summarized briefly below. Because this is a work in progress, Dr. Prober and I welcome your input, comments and additional suggestions.

The Draft Task Force Recommendations to date include:

- Support the processing of all clinical research contracts by the Office of Sponsored Research, in parallel with the Research Management Group, with the goal to complete processing within 30 days of receipt.
- Support the institution in creating a process for tracking the status of clinical research contracts by the Office of Sponsored Research that is accessible to faculty in “real time”.
- Support the development of Research Process Managers who specialize in clinical research.
- Mandate that Principal Investigators and/or Study Coordinators participate in a formal review of the commitments demanded by their research protocols and the appropriate budgeting of all commitments and services specified in the contract.
- Support the relocation of the Office of Sponsored Research accounting staff to the School of Medicine to facilitate interactions with all other clinical research administrative staff.

- Establish an office within the hospital to facilitate enhanced communication between hospital administration and clinical research personnel.
- Standardize, formalize and centralize training for all staff (medical and administrative) involved in the conduct of clinical research.
- Centralize all support services (academic and administrative) involved with the design, implementation, and conduct of clinical research studies at the School of Medicine.
- Establish an Academic Support Core in the School of Medicine to include experts in the design, conduct, and analysis of clinical research studies. This core should be directed by an established clinical research scientist.
- Develop a consistent database strategy that is available to all major clinical research studies conducted by faculty across the School of Medicine and assure the availability of resources to support faculty needing to use the database for their clinical research programs.
- Develop formal training programs in the conduct of clinical research that are available and accessible to faculty and fellows interested in the conduct of clinical research studies.
- Develop didactic courses relevant to the design and conduct of clinical research for the curriculum of the School of Medicine and an apprenticeship program for students interested in the conduct of clinical research under the direction of faculty mentors.

Again, the recommendations provided above are being offered to you for comment and input. As we move forward with implementation of these or other recommendations, it will be essential to assure that we are using all of our resources in a coordinated manner. These include those from the NIH General Clinical Research award as well as other institutional or private resources. Importantly, it will be critical that we build synergy and coordination while, above all, avoiding fragmentation or redundancy. Thus, building on the current ACCESS model and the GCRC resources provides the most optimal approach.

We will next be considering how to implement these recommendations in an organizational and functional manner and, with that, determining the level of investments that will be necessary. We do this since we remain convinced that if Stanford is to fulfill its mission in translational and clinical research, we must have the infrastructure and related educational components to optimize our approach to clinical investigation.

Medical Student Health Policy Debate

On Tuesday, April 16th, I had the pleasure to moderate a debate on whether Stanford medical school students should support a single payer system or a competitive model for health care in the United States. This health policy debate was arranged by Everett Meyer and Unzila Ali (both SMS I) and included Dr. Donald Barr, Associate Professor of Sociology and Human Biology, and Sara Singer, Executive Director of the

Center for Health Policy, Senior Research Scholar at the Institute for International Studies and Lecturer in Stanford's Public Policy Program.

The debate permitted Professors Barr and Singer to present their reasons for supporting a single payer system or a market driven one respectively and also offered an opportunity for medical students and other attendees to engage in the debate.

I found this to be a very successful format and was pleased by both the large number of students who attended and their engagement in the important questions being addressed. There is no doubt that such questions are as important as other academic issues confronting our students and that a debate format, which displays the pros and cons surrounding an important societal matter, offers an excellent forum for discussion. I hope this will be expanded to include other important societal and ethical issues facing medicine in the 21st Century.

Departmental Visits

During the past year I have attended faculty meetings of basic and clinical science departments in order to better understand the specific issues and challenges that are important to specific disciplines and departments and as a means for reaching out and engaging with faculty within the School. I am now beginning returns visits to departments and plan to do this on at least an annual basis. During the past two weeks I visited with faculty from the Departments of Pathology and Dermatology.

Pathology: Because of the strategic planning that has been going on in the Department of Pathology, this turned out to be my first visit. I learned on April 17th that during the past year the department engaged groups to address Research Programs, Housestaff Education and Clinical Services and Related Business Opportunities, asking each to assess current status, future directions and how to achieve them. Importantly, in each of these areas, the Department assessed how to also achieve its mission within the overarching umbrella of the School of Medicine's Strategic Plan. The current working Mission Statement for the Department of Pathology is: *To improve the diagnosis, treatment and basic understanding of human disease by clinical service, education and research.*

The Department of Pathology is enormously distinguished in its faculty and trainees. Despite its small faculty size (~40) compared to peer schools, it ranks #6 in the nation in overall NIH funding and, more importantly, #1 in NIH funding per faculty member. The department has a distinguished record of accomplishment in medical school teaching and an exceptional record of attracting housestaff who are outstanding and academically oriented. In addition, the clinical success of the pathology department programs is among the best in the nation, including quality, efficiency and cost.

At the same time, like other departments, Pathology is challenged by limitations in space for research as well as aging facilities, especially the Blood Center. They are also limited by the need to recruit additional faculty and the challenges faced at Stanford by retention and cost of living.

Thankfully, the Department is guided by exceptional leadership under Dr. Steve Galli and the outstanding team he has assembled.

Dermatology: On Friday April 19th I had my second visit with the faculty in the Department of Dermatology. The Mission Statement for Dermatology is:
Sustained leadership in scientific investigation, patient care and in training future leaders of our specialty in an environment that fosters creativity and synergy.

Like the Department of Pathology, the Department of Dermatology is also small compared to peer institutions in overall faculty size (~16) but it ranks #4 in overall NIH research funding. The department's research is both basic and clinical and includes a focus on epithelial biology, cutaneous malignancies and gene therapy – focusing on epidermolysis bullosa as a model. The department's investment in translational research is notable.

Dermatology also has an outstanding record of attracting top graduates to its training program and this year matched each of its positions with its top choices. The leadership in Dermatology has also played an important and valued role in advising medical students about career opportunities in dermatology, including positions at other medical centers.

The Dermatology Department is very active clinically, with 39,000 combined visits (including SHC, LPCH, Santa Clara Valley Medical Center and the Palo Alto VA). Indeed, the program at the VA is the largest clinical dermatology program in the nation. However, because dermatology is almost exclusively an outpatient program, with relatively few ancillaries, it is financially challenged, especially in a high cost hospital setting.

Like other departments, the challenges facing dermatology include lab space, the need for lower cost ambulatory space and faculty recruitment. Again, Dr. Al Lane has done an excellent job as the leader of Dermatology and has the deep respect and support of his faculty in addressing the challenges and opportunities that lie ahead.

Update from the AAMC Council of Dean's Meeting: Physician Workforce

At the Association of American Medical Colleges (AAMC) Council of Dean's Meeting that was held from April 20- 23rd, a presentation and discussion was held on the physician workforce. The bottom line is that most of the surveys that have been

conducted to date are flawed methodologically and have not been of true value in making accurate predictions. An economic and demographic trend analysis performed by Richard Cooper et al (Health Affairs, 2002; 21:140-154) offers a more robust analysis and presents an emerging shortage of physicians during the next two decades. This is especially true for specialty-trained physicians. While the roles of primary care physicians can be balanced to some degree by non-physician clinicians (e.g., Nurse Practitioners, Physician's Assistants) the gap for specialists will likely require an expansion of training programs. The projected needs that appear to be emerging are addressed, at least by Stanford, by the directions we have identified as part of our School-wide Strategic Plan.

President's Address to the Academic Council and Focus on Multidisciplinary Research and Education

On Thursday, April 18th, President Hennessy delivered his annual report to the Academic Council. The contents of his presentation are covered in the April 24th issue of the Stanford Report. As part of his presentation, I joined Deans Sharon Long (Humanities & Sciences) and Jim Plummer (Engineering) to review Stanford's evolving efforts and commitment to multidisciplinary research and education. In my remarks I highlighted why multidisciplinary programs are important to Stanford, and why Stanford is so unique and poised to carry them out. This is evidenced by the fact that we are already successful in this emerging arena. I cited that Stanford has a long and rich history in interdisciplinary programs and that faculty and students both enjoy and benefit from collaborations. More recent evidence of successful multidisciplinary programs in the sciences include BioX and, the Clark Center, which will open in the summer of 2003 at the crossroads of the Engineering & Sciences area and the School of Medicine campus. Further evidence will be the new joint Department of Bioengineering between the Schools of Engineering and Medicine that will include both programs in undergraduate and graduate education as well as research collaborations. Of course, within the School of Medicine, multidisciplinary research and education characterize our future, especially around translational research as will be increasingly evidenced by the formation of multidisciplinary "Institutes" (e.g., the Cancer Institute), the collaboration of basic and clinical scientists in medical and graduate student education and novel approaches to patient care. During the years ahead, Stanford will be distinguished by further novel approaches to multidisciplinary research and education and I am pleased to note that the School of Medicine will play a very important and central role in these new ventures.

Events

Dinner for Nobel Laureates: Stanford has a higher number of living Nobel Laureates (i.e., 17) than any other peer University. On Wednesday evening, April 17th, President Hennessy hosted a dinner in honor of this most distinguished faculty at the Hoover House. I had the privilege to attend that event. Drs. Paul Berg and Arthur Kornberg are the Nobel Laureates at Stanford and Dr. Joshua

Lederberg moved from Stanford to Rockefeller University. Based on the exceptional work going on in the Medical School, it seems likely that in the hopefully not too distant future other current members of the Stanford Medicine faculty will join these ethereal ranks.

Welcoming Potential Students: April 19-21st was “Admit Weekend” at Stanford, including the School of Medicine. Beginning Friday, April 19th, Student Affairs hosted some 50 students who have been accepted to Stanford for a visit to the campus and the chance to learn more about the School and the opportunities it offers for a world-class education. I had the pleasure to meet the students and am confident that, thanks to the enormous efforts of Student Affairs and especially our current Year One students, that all who came had a wonderful impression of our School. I want to thank our faculty, staff and especially our students, for being such gracious and informed hosts and advocates.

Welcoming Dinner for Martha Marsh: On Wednesday evening April 24th, friends and supporters of Stanford Hospital & Clinics and the Medical Center joined me at a reception at the California Café to welcome Ms. Martha Marsh, new President/CEO of SHC. Ms. Marsh has been on the job for only three weeks but has already engaged with important and challenging issues. Her energetic and enthusiastic approach to problem solving and her commitment to excellence are already quite apparent. Her arrival at SHC was much appreciated by Stanford Health Partners, members of the Board of Directors and proffers an exciting future.

Second Faculty Luncheon: On Thursday, April 25th, I was pleased to host my second informal small lunch with faculty from basic and clinical sciences. These lunches afford an opportunity for us to get to know each other and to share ideas, concerns or issues that faculty feel are important. I welcome learning more about these matters and hope those who have not attended will come to a future luncheon. If you are interested please contact Ms. Sharon Olsen at sharon.olsen@Stanford.EDU.

Remembering Dr. Jess Shenson: On Friday, April 27th, colleagues, friends and students gathered for a Memorial Service to remember Dr. Jess Shenson, longtime benefactor, teacher and friend of the Medical School and Stanford University. The service included prayers and reflections on Judaica, thoughts and remembrances by faculty and friends about Dr. Shenson, and musical messages by Mozart and Tallis that were sung and played by students and faculty from Stanford. Dr. Jess Shenson loved art, music, medicine, Judaica, young people, friends and Stanford. It is clear that he was also loved and will long be remembered for his contributions to institutions and, even more importantly, to people – especially students.

Announcements

- Denise L. Johnson, M.D., Assistant Professor of Surgery is one of this year's recipients of the **Women of Color in Health, Science and Technology Award**. Dr. Johnson received her B.Sc. in medical science from Northwestern University and her M.D. from Washington University of St. Louis, Mo. A Fellow of the Society of Surgical Oncology and the American College of Surgeons, she has been involved in numerous scientific studies and has supervised 16 research fellows in basic biomolecular research involving oncology issues. Dr. Johnson's hard work and dedication to research fellows and students is the clinician-researcher-teacher role model that will be critical to the future of medicine here at Stanford and nationwide.
- The **19th Annual Stanford Medical Student Research Symposium** to be held on Friday, May 3rd from 1 to 5 pm in the Dean's courtyard and M 100 classrooms.

This symposium provides a forum for medical students (MD and MD/PhD) to present their research to each other and the medical community. Basic, epidemiological and clinical research, either in progress or completed will be presented. Students will be giving oral and poster presentations in Fairchild Auditorium and lobby. This yearly event is an excellent opportunity for you to become familiar with the diversity of research activities undertaken by the medical student body. I hope you will take the opportunity to attend the Symposium and share your enthusiasm with the students about their research and how important it is to their future and to Stanford.

Appointments and Promotions

Linda E. Foppiano has been appointed to Assistant Professor of Anesthesia, effective 5/1/02 to 4/30/05.

Frank Hanley has been appointed Professor of Cardiothoracic Surgery and of Pediatrics, effective 5/1/02.

Keith Humphreys has been promoted to Associate Professor of Psychiatry and Behavioral Sciences (Research), effective 5/1/02-4/30/08.

Frederic B. Kraemer has been appointed the Stanford University Professor of Endocrinology, effective April 8, 2002.

Bryan D. Myers has been appointed the Stanford University Professor in Nephrology, effective April 8, 2002.

Anthony Oro has been reappointed Assistant Professor of Dermatology, effective 6/1/02-11/30/05.

David Spain has been appointed Professor of Surgery at Stanford University Medical Center, effective 5/1/02-4/30/07.

Mark Welton has been appointed Associate Professor of Surgery at Stanford University Medical Center, effective 5/1/02-4/30/07.

Congratulations to all!

Dean's Newsletter May 13, 2002

Initiation of Seminars on the Respectful Workplace

The School of Medicine is inaugurating a series of briefings for departments regarding the "Respectful Workplace". These important briefings will review the current state of the law and University policy as well as the resources available to assist with workplace issues. The first such briefing will be held for the Department of Pediatrics on Monday, May 13th, from 12:00 - 1:00 p.m., in the LPCH Board Room. The presenters will include:

David Stevenson - Senior Associate Dean for Academic Affairs
Greta Schnetzler - Legal Counsel, Gordon Rees and Associates
Tom Fenner - Legal Counsel, Stanford University
Laraine Zappert - Director, Sexual Harassment Policy Office
Martha McKee - Ombudsperson, School of Medicine
Cori Bossenberry - Director, Human Resources, School of Medicine

Web Links:

- 1.) SOM Faculty Handbook: Respectful Workplace
<http://www-med.Stanford.edu/academicaffairs/handbook/chapt10.html#10.15>
- 2.) SOM Respectful Workplace – Excerpts from:
 - a. Dean's Newsletter, January 22, 2002:
http://deansnewsletter.stanford.edu/archive/01_22_02.html#1
 - b. Dean's Newsletter, April 29, 2002
http://deansnewsletter.stanford.edu/archive/04_29_02.html#1

I urge everyone to attend these sessions when they are scheduled for your department.

Commencement 2002

Stanford University and the School of Medicine Commencement Exercises will be held on Sunday June 16th. I urge all faculty to attend and to march along with our medical and graduate students. The University Commencement will begin at 9:30 a.m. and will be held in the Stanford Stadium.

Our School of Medicine Commencement will be held on the Dean's lawn beginning at 2:00 p.m. I am very pleased to announce that this year's Medical School Commencement Speaker will be Dr. Irving Weissman, Karel and Avice Beekhuis Professor of Cancer Biology and Professor, by courtesy, of Biological Sciences. In addition to his internationally recognized work in immunology, Dr. Weissman is a pioneer in stem cell research and has contributed both knowledge and wisdom to the scientific and ethical debates surrounding stem cells and human cloning. Dr. Weissman has also been an articulate advocate and champion for medical and graduate education and for Stanford Medicine. It will be an honor to have him as this year's commencement speaker.

HIPAA Privacy Regulation Update

The following important update is provided by Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology:

The Health Insurance Portability and Accountability Act (HIPAA) privacy regulations are scheduled to go into effect April, 2003. These regulations, mandated by the Department of Health and Human Services, provide significant new protections to the privacy of patient's health information. In order to become compliant with these new federal rules, academic medical centers will be required to make significant changes to how they manage patient data both in electronic format and on paper. Furthermore, the regulations will impact how patient data is used in biomedical research and education.

Stanford Hospital & Clinics, the Lucile Packard Children's Hospital and the School of Medicine have been actively addressing the HIPAA privacy regulations. The Dean's office, through the Office of the Senior Associate Dean for Information Resources and Technology, is working with the hospital HIPAA committee to assist in developing unified policies. Additionally, in the coming months the Dean's office will be conducting a survey of all faculty and staff to determine the individual impact of these regulations. The Dean's office will work closely with departments, faculty, staff and students to ensure that research and educational activities will continue while ensuring compliance with HIPAA regulations. Please refer to the following website for updates on HIPAA-related activities: <http://hipaa.stanford.edu/>

Update on the Strategic Plan

We are continuing to make progress on virtually all aspects of our School of Medicine Strategic Plan. As you will recall, this effort comprises virtually all of the School's missions and, when fully implemented, will help to transform Stanford into a global

model for research-intensive medical schools. Since my last update, several goals have been achieved, including the following:

1. **Medical Student Education:** Dr. Julie Parsonnet, Senior Associate Dean for Medical Education and Student Affairs, has formed a Curriculum Reform Steering Group that includes herself, Dr. Neil Gesundheit, Associate Dean for Medical Education and Student Affairs, Dr. Gary Schoolnik, Professor of Medicine, Dr. Timothy Stanton, Department of Graduate Student Support, and Mr. David O'Brien, Director Institutional Planning in the School of Medicine.
 - a. Core Curriculum Committee, Dr. Gesundheit, Chair
 - b. Scholarly Tracks Committee, Dr. Schoolnik, Chair
 - c. Teaching Incentives Committee, Dr. Parsonnet, Chair
 - d. Medical Education Community Service Project, Dr. Stanton, Chair
2. **Graduate Student Education:** To help achieve one of our very important initiatives, a position description has been developed and posted for an Assistant Dean for Graduate Student Diversity. It is our hope to hire an individual to serve as a leader of this important effort as soon as possible.
3. **Postdoctoral Scholars:** Progress has been made in the nomenclature previously used to categorize postdoctoral scholars, referring to them now as trainees. In addition, Dr. James Nelson, Senior Associate Dean for Research and Graduate and Postdoctoral Education, is assessing compensation levels for postdoctoral trainees and the maximum duration of training allowable at Stanford.
4. **Research Programs:** The Dean's office is exploring the feasibility of implementing the recommendations made concerning clinical research (see Newsletter, 4/29/02). Planning is also underway for a Fall Research Retreat that will be lead by Dr. James Nelson.
5. **Clinical Care:** With Martha Marsh, CEO of Stanford Hospital & Clinics now in place, discussions about the Faculty Practice Plan are resuming. Also, SHC is leading its own strategic planning effort regarding the future growth and development of inpatient and ambulatory programs. Clearly, an important goal is to link the clinical strategic plans of SHC and LPCH with those of the School, recognizing that there will be areas of overlap and synergy as well as areas that the School will want to develop further because of their importance in facilitating translational research opportunities.
6. **Professoriate:** Considerable effort is underway regarding further delineation of the Medical Center Line and the Voluntary Clinical Faculty. There are a number of rumors circulating regarding the VCF in particular and I want to underscore that our sole goal is to better delineate the criteria for appointing and evaluating adjunct appointments for our community colleagues. I also want to underscore that we very much value and respect the significant contributions that community physicians provide to the clinical education of our students and residents. We want to honor those contributions in a manner that respects our community physician educators, the School of Medicine and the University. I anticipate that reports from these committees will be completed by June or July and announcements will follow once the recommendations have been evaluated and approved.

7. **Finance and Administration:** Mr. Michael Hindery, Senior Associate Dean for Administration and Finance, is convening a committee to complete the recommendations regarding the proposed new operating budget for FY04. These recommendations will be ready for implementation in the budget planning process that will begin early next year.

Medical Student Research Symposium

On Friday, May 3rd, the Nineteenth Annual Stanford Medical Student Research Symposium was held, featuring 51 oral or poster presentations. This important activity permits our students to share the fruits of their research endeavors with each other and with faculty. It is a special event and I want to commend all who participated in this wonderful activity. Having reviewed the posters and having attended as many oral presentations as possible, I must say how pleased and impressed I was regarding the work that is being accomplished by our students.

I also want to thank the Program Committee that helped make the Symposium possible, including: Pat Cross, Ph.D., John Cooke, M.D., Ph.D., Susan Knox, M.D., Ph.D., Jerry Hsu, SMS V, Benjamin Hoehn, SMS IV, Brian Courtney, SMS II, Wesley Neal, SMS II, Eliza Long, SMS I and Gladys Martin, SMS I. I also want to thank Maria Berumen, who served as Symposium Program Coordinator.

The topics ranged from basic to clinical research and all participants are to be commended. At the conclusion of the Symposium, several presentations were judged worthy of special commendation. These included:

Oral Presentations:

1. **Theodore Leng** (with M.S. Blumenkranz and H.A. Fishman): Directed ganglion cell growth and stimulation with microcontact printing as a prototype retinal prosthesis interface.
2. **Jennifer J. McIntire** (with Sarah E. Umetsu, V. Pete Yeung, Gesine Hansen, Michael Potter, Vijay Kuchroo, Gregory Garsh, Gordon J. Freeman, Dale T. Umetsu and Rosemarie H. DeKruyff): Identification of TAPR (T Cell and Airway Phenotype Regulator) Locus, and positional cloning of the TIM gene family.
3. **Brian D. Mulligan** (with J.C. Dugan and B.A. Barres): The role of target innervation and jagged 1 expression in CNS myelination.

Poster Presentation:

1. **Alyssa A. Brewer** (with H.A. Basseler, L.T. Sharpe, A.B. Morland, H. Jagle and B.A. Wandell): Reorganization of human cortical maps caused by inherited photoreceptor abnormalities.
2. **Anil Menon** (with C. Bruyns and R. Boyle): Developing a simulation engine and virtual environment for surgical training, experimental practice, and telemedicine.

3. **Naveen Yalamanchi** (with Matt B. Klein, Amarjit Dosanjh, Hung Pham, Michael Longaker and James Chang): An optimized in vitro chondrocyte-alginate construct.

Congratulations to all!

Additional Awards and Recognition for Medical Students

I am also pleased to announce several additional recognitions for our students. These include:

- **Naveen Yalamanchi, SMS III, Nirav Bhakta, SMS IV, Vikaas Sohal, SMS IV, Rajen Desai (undergraduate), Amarjit Dosanjh, SMS V** represented the South Asian Preventive Health Outreach Program (SAPHOP), which finished as a national semi-finalist in competition for the Department of Health and Human Services Secretary's Award for Innovation in Health Promotion. SAPHOP is a volunteer outreach program which addresses the need of disease prevention among the South Asian underserved communities - especially recent immigrants and the elderly, through health education, health screenings, women's health initiatives, elderly health alliance and blood/bone marrow donation drives.
- **Glen Valenzuela, SMS III** was awarded a National Institute of Health Alcohol Abuse and Alcoholism Summer Research Fellowship.
- **Julie Ishida, SMS I** was accepted into the Mass Media Science and Engineering Fellows Program, American Association for the Advancement of Science. Julie will spend ten weeks carrying out research in communication, working as a reporter, researcher or production assistant in media organizations nationwide.
- **Arthur Lee, SMS II** received an American Heart Association Summer Research Fellowship.

Congratulations to all!

Update on the Department of Bioengineering

During the past several months, committees on undergraduate education, graduate education and academic governance, administration and finance have been meeting to help plan for the new department of bioengineering that will be jointly developed by the Schools of Engineering and Medicine. To review and share the work of these committees and further refine our direction, a Retreat was held on Saturday, May 4th, involving 26 faculty equally distributed between the two schools. Dr. Paul Yock, Professor of Medicine, served as the Chair of the Retreat and played an important role in facilitating thoughtful and productive dialogue. In addition to hearing and discussing

reports from each of the committees, we also spent time further developing the draft mission statement for the new Department of Bioengineering, which is:

To create a fusion of engineering and the life sciences that promotes scientific discovery and the development of new technologies and therapies through research and education.

Based on this mission, the faculty working on this important initiative believe that bioengineering combines biology, medicine and engineering to understand how living systems work; to learn from biological systems to improve engineering designs; to engineer biological systems; and to improve human and environmental health.

Dr. Jim Plummer and I are working on a schedule that will enable us to present the new department structure to the University Advisory Board in May and to the Board of Trustees on June 13th. If approved, the proposal for the new department will come to the Faculty Senate in the Fall of 2002.

Hospital Updates

At the Internal Governing Council meeting on Friday May 10th, Ms. Martha Marsh, President and CEO of Stanford Hospital & Clinics, gave a brief overview of some of the future plans she and her staff will be charting in the weeks and months ahead. Among these are a critical analysis of the clinical capacity of inpatient and ambulatory facilities needed to accommodate the clinical program at SHC. Should there be an increase in bed capacity, a critical evaluation of physician/faculty staffing will be needed in concert. An important issue for Ms. Marsh is service excellence for patients, as well as for referring physicians and for the physicians and staff practicing at SHC. Improved service should give evidence of what Stanford does truly well in patient care and should be measurable and assessable in comparative analyses. Ms. Marsh reviewed areas of institutional accomplishment and distinction as well as areas where work and improvement is needed. Although the challenges are significant, she underscored her commitment to the success of SHC and excitement about being a part of the Stanford community.

Events

- **Memorial Service for Dr. Ken Melmon:** On Monday, April 29th, a memorial Celebration of the Life of Kenneth L. Melmon (July 20, 1934 – April 8, 2002) was held at the Arrillaga Alumni Center. With hundreds of family, friends and colleagues in attendance, the life of Dr. Melmon was reflected and reviewed by his children, Brad and Debbie, and by his friends and colleagues from USCF and Stanford. A number of Stanford faculty and community leaders spoke about their association with Ken Melmon, including Drs. Hal Holman, Terry Blashcke, Stan Cohen, Tom Rindfleisch and Tony Meier. These and other speakers painted a life of commitment, passion, intelligence and dedication to sciences, medicine, family, friendship and life.

- **Seniors' Luncheon:** In association with Alumni Weekend, a special luncheon was held for graduates of the School of Medicine who received their M.D. degrees prior to 1952. This was the third annual luncheon sponsored by the Stanford Alumni Association and it featured nearly 60 alumni from the Classes of 1938 through 1952. I had the privilege of addressing these alumni about the changes in medicine that have transpired during their personal and professional lifetimes and about the challenges and opportunities that lie ahead. I underscored that in addition to celebrating the scientific and technological innovations that will increasingly characterize medicine in the 21st Century, it is important to reaffirm the values of trust, confidence and human caring that characterized these senior physician alumni during their medical careers. It was also notable that when queried about whether they were pleased to have a career in medicine, virtually every member of this group of senior alumni responded affirmatively. This was notable and in stark contrast to the report published recently from the Kaiser Brothers Foundation which showed that during the last five years 87% of the 2600 physicians surveyed nationwide have showed further deterioration in the value of a career in medicine.
- **Alumni Weekend Events:** Stanford Medicine Alumni Weekend was held on May 3-4th and proved to be a resounding success. Special thanks go to Dr. Ross Bright, Associate Dean for Alumni Affairs, as well as our Office of Medical Development Staff, especially Andrew Cope, Director of Annual Giving and Alumni Relations, and Ms. Kaleo Waxman, Assistant Director of Alumni Relations, for their support of these events. This year Alumni Weekend included a Symposium on Aging, which was held on Friday, May 3rd, and featured outstanding presentations by Drs. William Haskell, Christopher Gardner, Fred Luskin and Glenn Brassington.

On Friday evening, May 3rd, the J.E. Wallace Sterling Lifetime Alumni Achievement Award Dinner was held, honoring F. William Blaisdell, M.D. '52, Chair Emeritus, Department of Surgery, University of California, Davis. The evening events included a welcome by Dr. Joshua Prager, President of the Stanford Medical Alumni Association, along with personal and professional reflections about Dr. Blaisdell given by Roy Cauwet, M.D. '52, and Neal Olcott IV, currently Professor of Surgery at Stanford.

The J.E. Wallace Sterling Lifetime Alumni Achievement Award was created in 1983 to recognize distinguished Stanford alumni. Dr. Blaisdell, who received his B.S. and M.D. from Stanford, has been a seminal figure in developing the field of trauma surgery in the USA.

In addition to tours and social events, the Stanford Alumni Association also sponsored an excellent Continuing Medical Education Symposium on Saturday, May 4th that featured Stanford faculty or alumni and focused on pain management. Speakers at this symposium included Howard Fields, M.D. '65, Ph.D. '66, currently Professor of Neurology and Physiology at UCSF, Pamela Pierce Palmer, M.D. '92, Ph.D. '92, Medical Director, Pain Management Center,

UCSF, Raymond Gaeta, M.D. '85, Associate Professor of Anesthesia and Director of the Pain Management Services at Stanford, and Joshua Prager, M.D. '81, M.S. '81, Director of the California Pain Medicine Centers and President of the Stanford Medical Alumni Association. The feedback on the symposium was outstanding and special thanks go to all of our speakers.

- **Louis and Dorothy Kovitz Visiting Professorship Lecture:** On Friday, May 10th, Dr. Norman E. Shumway, Frances and Charles D. Field Professor, Department of Cardiothoracic Surgery at Stanford, delivered the 28th Louis and Dorothy Kovitz Visiting Professorship Lectureship. The Kovitz Lecture is a most distinguished lecture and Dr. Shumway spoke before a standing-room only audience about the extraordinary work that he and his colleagues performed at Stanford in pioneering and developing heart transplantation and one of the most distinguished Departments of Cardiothoracic Surgery in the world.

Announcements

- **Picture the Future: The Promise of Medical Imaging and Biomedicine.** On behalf of the Department of Radiology, I am pleased to extend an invitation to the Stanford Community to celebrate the 10 Year Anniversary of the Richard M. Lucas Center on Friday May 31st. This event will be held at the Lucas Center (1201 Welch Road) and will open with interactive poster presentations of important scientific advances in medical imaging from 1:30-3:00 pm. A symposium will follow from 3:00 to 5:00 p.m., led by major figures in academia and industry who will speak to the theme.

Medical imaging has been identified as one of the most significant developments in medicine in the last quarter century. William Brody, M.D., Ph.D., President, The Johns Hopkins University, and Erich R. Reinhardt, Ph.D., President and CEO, Siemens Medical Systems, will reveal how Academia and Industry will participate in the acceleration of imaging advances in the years to come.

In addition, David Botstein, Ph.D., Professor and Genetics, Alan Garber, M.D., PhD., Professor of Health Research and Policy, and Jeffrey R. Immelt, Chairman of the Board and CEO, General Electric, will join in an open panel discussion to close the afternoon symposium.

The Department of Radiology hopes to bring public focus to the revolution that is occurring in medical imaging and how these innovations will benefit society. For further details please see their website: <http://www-radiology.stanford.edu/lucas10/index.html>.

- **Help Lane Medical Library Plan for the Future.** Lane Medical Library has developed a detailed needs assessment and planning survey, now available from the library's web page, <http://lane.stanford.edu/survey.html>. This survey is designed to evaluate current library services and to solicit suggestions for new services and possibly new facilities. This information will help with the planning for the Stanford Medicine Information and Learning Environment that will be commencing soon. The survey takes approximately 5 to 10 minutes to complete.

A drawing for prizes will be available for those who complete the entire survey. If you have any questions about the survey, please contact Christopher Stave at: cstave@stanford.edu

Congratulations

- **Elected to the National Academy of Sciences:** Of the 72 individuals elected to the National Academy of Sciences this year, six are at Stanford, three of whom are in the School of Medicine. These include:
 1. **Patrick O. Brown**, Professor of Biochemistry and Associate Investigator in the Howard Hughes Medical Institute.
 2. **Eric I. Knudsen**, Edward C. and Amy H. Sewall Professor and Chair of the Department of Neurobiology.
 3. **Michael Levitt**, Professor and Chair of the Department of Structural Biology.
- **Dr. Paul Berg:** On May 7th, Dr. Paul Berg, Professor of Biochemistry, Emeritus, added another award to his long list of extraordinary achievements. Dr. Berg was the recipient of the Leadership in Science and Education Award from the Exploratorium. Congratulations (again) to Dr. Berg.
- **Dr. Alan M. Krensky**, Shelagh Galligan Professor of Pediatrics, completed his tenure as President of the Society of Pediatric Research and delivered an important and insightful vision of the role of children's hospitals in the future of American Medicine at the Pediatric Academic Society Meeting in Baltimore on May 6th. He highlighted the unique and important role that institutions like Stanford and the Lucile Packard Children's Hospital will likely play in shaping the future of pediatric research and training.
- **Dr. Emmet Keefe**, Professor of Medicine and Chief of Hepatology has been elected to become the President-elect of the American Gastroenterological Association (AGA), the largest society of gastroenterology and hepatology in the world, with a membership exceeding 14,000. He serves as Vice President beginning in May, 2002 and assumes the responsibilities of President in 2004.

Congratulations to all!

Appointments and Promotions

- **M. Gail Boltz** has been reappointed to Assistant Professor of Anesthesia at the Stanford University Medical Center.
- **Jin Hahn** has been reappointed to Associate Professor of Neurology and Neurological Sciences and of Pediatrics, and, by courtesy, of Neurosurgery at the Stanford University Medical Center.

- **Weldon Haw** has been appointed to Assistant Professor of Ophthalmology at Stanford University Medical Center.
- **Stewart McCallum** has been reappointed to Assistant Professor of Urology at the Stanford University Medical Center.
- **Michael W. Risinger** has been promoted to Associate Professor of Neurology and Neurological Sciences and, by courtesy, of Neurosurgery at the Stanford University Medical Center, effective 6/1/2002.

Dean's Newsletter

May 27, 2002

Respect and Tolerance

During the past several weeks, I have written several commentaries about respect in the work place and have sent out messages of concern regarding intolerance on our campus. The most recent messages have been initiated by reports that posters advertising a course sponsored by our LGBT students were being torn down and shredded, and signs placed in a glass-enclosed cabinet outside of the Department of Pathology offices were spray-painted over with a large "X". Such acts of vandalism and intolerance impact the integrity of our community.

One of the great things about our nation is the personal freedom of its citizens. We each have a right to our own opinions, beliefs, choices and expressions. We can disagree and debate with each other but we cannot discriminate or purposefully create harm or fear by acts of intolerance or disrespect. Whether the issue is race, religion, sexual orientation or views on politics or science, we have the opportunity to speak openly, honestly and respectfully. Most importantly, we have the opportunity to teach and learn from each other. However, we do not have the right to physically tear down others' views, whether symbolically by shredding signs or spray-painting over encased posters, or by more direct acts of aggression or violence. Because symbols of intolerance threaten the safety of our community, it is imperative that we each demonstrate our support and, indeed, celebration of our diversity, as well as our support and concern for each other. I have shared this message with our students, both in written communications and at a special meeting held on Friday, May 24th. I share it with our entire community once again and call on each member of the School of Medicine to demonstrate leadership and vigilance in respecting and tolerating each other's rights.

Statement on Professionalism for Stanford

The following statement has been adapted from the American Boards of Internal Medicine and Pediatrics and was presented by Dr. Eddie Atwood to the School of Medicine Faculty Senate on Wednesday, May 15th. Ironically, this Statement was

discussed at the Senate just one day prior to the latest act of intolerance described above. With permission, I present this statement to our School community for your review and comment. I hope you will consider the points contained in this statement carefully and offer your comments to either Dr. Eddie Atwood or Dr. Lorry Frankel.

Professionalism comprises those attributes and behaviors that serve to maintain patient interests above physician self-interest. Professionalism extends beyond interactions with patients and their families, however. Professionalism also involves the relationships between physicians and other health professionals and the interactions between specialties and between professional organizations. It has implications for research activities and interactions with pharmaceutical companies. Professionalism should pervade all of our activities in medicine and should include:

A commitment to the highest standards of excellence in the practice of medicine and in the generation and dissemination of knowledge.

A commitment to sustain the interests and welfare of patients.

A commitment to be responsive to the health needs of society.

The elements of professionalism include altruism, accountability, responsibility, excellence, duty, honesty, integrity and respect for others. These elements are further defined as follows:

Altruism is the essence of professionalism. Altruism refers to unselfish regard for and devotion to the welfare of others and is a key element of professionalism. Self-interest or the interests of other parties should not interfere with the care of one's patients and their families.

Accountability and responsibility are required at many levels -- individual patients, society and the profession. First there must be accountability to one's patients and to their families. There must also be accountability to society for addressing the health needs of the public and to ensure that the public's needs are addressed. One must also be accountable to the profession to ensure that the ethical precepts of practice are upheld. Inherent in responsibility is reliability in completing assigned duties or fulfilling commitments. There must also be a willingness to accept responsibility for errors.

Excellence entails a conscientious effort to exceed ordinary expectations and to make a commitment to life-long learning. Commitment to excellence is an acknowledged goal for all physicians. A key to excellence is the pursuit of and commitment to providing the highest quality of health care through lifelong learning and education. One must seek to learn from errors and aspire to excellence through self-evaluation and acceptance of the critiques of others.

Duty is the free acceptance of a commitment to service. This commitment entails being available and responsive when "on call," accepting inconvenience to meet the needs of one's patients, enduring unavoidable risks to oneself when a patient's welfare is at stake, advocating the best possible care regardless of ability to pay, seeking active roles in professional organizations, and volunteering one's skills and expertise for the welfare of the community.

Honesty and integrity are the consistent regard for the highest standards of behavior and the refusal to violate one's personal and professional codes. Honesty and integrity imply being fair, being truthful, keeping one's word, meeting commitments, and being forthright in interactions with patients, peers, and in all professional work, whether through documentation, personal communication, presentations, research, or other aspects of interaction. They require awareness of situations that may result in conflict of interest or that result in personal gain at the expense of the best interest of the patient.

Respect for others is the essence of humanism, and humanism is central to professionalism. This respect extends to all spheres of contact, including but not limited to patients, families, other physicians, and professional colleagues, including nurses, residents, fellows, and medical students. One must treat all persons with respect and regard for their individual worth and dignity. One must listen attentively and respond humanely to the concerns of patients and family members. Appropriate empathy for and relief of pain, discomfort, and anxiety should be part of the daily practice of medicine. One must be fair and nondiscriminatory and be aware of emotional, personal, family, and cultural influences on patient well-being and patients' rights and choices of medical care. It is also a professional obligation to respect appropriate patient confidentiality.

In my opinion, these principles apply to all who work at Stanford Medical School, regardless of whether one is an MD or PhD student, a postdoctoral scholar, a faculty member or a staff member. The more that we embrace altruism, accountability, responsibility, excellence, duty, honesty, integrity and respect for others, the better our work place will be. It is as important to act professionally with each other, just as we care for our patients as professionals.

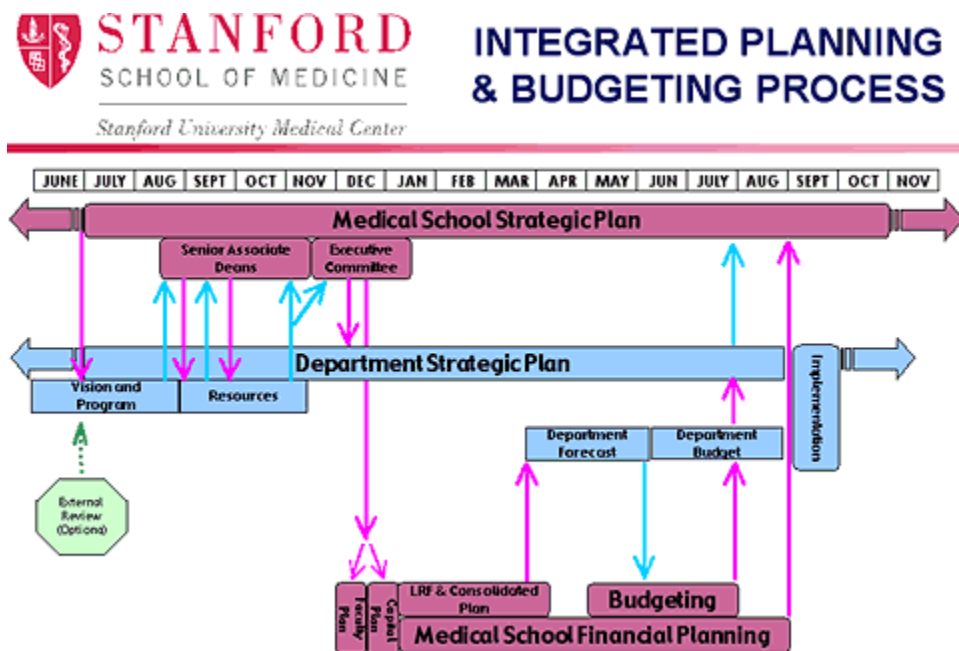

Departmental Planning

Nineteen departmental reviews were carried out in the School of Medicine from 1994 to 2000. Although the goal of these reviews, conducted by external peer-review committees, was to assess the direction and success of a department's efforts in research, education, clinical care and leadership, it is not clear that these objectives were always met. Further, it is not clear that the external review process led to significant change within departments. Moreover, this review process was time-consuming for faculty and Chairs, as well as expensive and highly variable with respect to outcomes. When queried about

the usefulness of the Departmental Review process, most Chairs indicated that the past process has generated too much data and too little future planning. Importantly there has been no formal linkage of the review process to a budget or resourced allocation process, nor has the process been aligned with the mission of the School.

Now that the School of Medicine has engaged in a wide-ranging Strategic Planning effort, it seems appropriate to transition from the traditional peer-reviewed departmental evaluation process to a more integrated program-planning process. The goal of this process is to assess the plans emerging from the faculty within departments and integrate them into School-wide plans and priorities. In addition, the scheduling of these reviews would benefit from alignment with the School's annual budget process.

Based on these goals, the newly proposed integrated planning and budgeting process is as follows:

This proposed change in departmental planning was reviewed with the Executive Committee on Friday May 17th. We will work out the details for this new process this Spring and then pilot the integrated planning process in 2-3 departments beginning this Summer. We will then evaluate the value of this new planning process in the Spring of 2003 and, if it meets our expectations, launch it more fully in the Summer of 2003.

In addition to the integrated planning process, we are currently assessing establishing a School of Medicine Scientific Advisory Council to help assess our overall strategy and

validate our direction to the Provost and President. Details regarding this Advisory Council will be forthcoming.

Postdoctoral Scholar Initiatives and New Policies

As part of our Strategic Planning process, the Work Group on Postdoctoral Scholars has recommended several new policies that have been approved by the Dean and Provost. These new policies, which have been communicated by W. James Nelson, Joseph Lipsick and Michael Cowan, include the following:

- All postdoctoral scholars must be registered with the Office of Postdoctoral Scholars.
- As of September 1, 2002, all postdoctoral fellows in the School of Medicine must be paid a minimum salary of \$35,000 or the applicable NIH scale for years of experience, whichever is greater.
- The mandatory maximum duration of postdoctoral training will be five years. This will exclude years spent in clinical training (80% clinical responsibility) for postdoctoral scholars with a medical/clinical degree (MD, DO, DDS, DVM). Principal Investigators who wish to retain an individual in the laboratory or program following the five-year maximum may do so by appointing him/her as a Research Associate.
- Without exception, no “volunteer” or “self-employed” postdoctoral scholars are permitted in the School of Medicine.
- All faculty members who train postdoctoral scholars should be familiar with the NAS-COSEPUP report on Postdoctoral Scholars, 2000, and use the “Principles, Action Points, and Recommendations” [<http://books.nap.edu/catalog/9831.html>] of this report has a guide.

A committee chaired by James Nelson and co-chaired by Judy Swain is reviewing the specific issues and challenges regarding clinical fellows.

Faculty Senate Update on Education and Library Facilities Planning

On Wednesday, May 15th, I presented an update to the Faculty Senate on our intermediate and longer term planning for education and library facilities. You will remember that just over a year ago the School was about to embark on a large-scale renovation plan referred to as the GALE Project (for the Grant, Alway, Lane and Edwards buildings contained in the “Stone Complex”). While the goal of the GALE Project was to create renewed education facilities, renovate the library, improve building infrastructure and renovate laboratory and administrative space, the numerous compromises that had become necessary ultimately failed to achieve the optimal goals for education, research and administration. Accordingly, upon transitioning to Stanford last February and learning more about the GALE project, I recommended to the University leadership and Board of Trustees that this project be terminated. However, that decision and recommendation has had a number of consequences. In addition to impacting

adversely on a number of clinical departments that were counting on laboratory and research space to meet faculty needs and expectations, the decision also required special approval from the Liaison Committee on Medical Education (LCME) which reports jointly to the AAMC (Association of American Medical Colleges) and the ACGME (Accreditation Council for Graduate Medical Education). Indeed, the LCME had served notice to Stanford that its education and library facilities, which had been relatively unchanged since the School moved to the Stanford campus in 1959, were in need of mandatory upgrades and improvements. Fortunately, Michael Hindery, Senior Associate Dean for Administration and Finance, and I were able to secure an extension from the LCME, with the expectation that we would submit our short term plans by May, 2002, and our long-range plans by May, 2004.

One of the important things that has changed since the GALE project is that we now have a much more robust and formative understanding of our goals and objectives for medical and graduate student education. The Work Group on Medical Student Education, led by Dr. Julie Parsonnet, Senior Associate Dean for Medical Student Education, as well as Graduate Student Education, led by W. James Nelson, Senior Associate Dean for Research, Graduate Student Education and Postdoctoral Affairs, and Professor Karla Kirkegaard, have brought increasing clarity to the education objectives that will define new education facilities. Similarly, the more recent appointment of Dr. Henry Lowe as Senior Associate Dean for Information Resources and Technology and the soon-to-be initiated search for the Director of the Lane Library makes the delineation of the medical library of the future within our grasp. Based on these and other events, I submitted a detailed update to the LCME describing our current and future plans as well as the interim steps we are taking to improve our current facilities until new ones are constructed.

Among the immediate improvement plans presented to the Faculty Senate are:

Recently Completed:

- Eight seminar rooms, a bio-skills lab and dissection rooms were constructed in CCSR. The seminar rooms have state-of-the-art AV technologies.
- A cooling system has been installed in Lane Library.
- The Medical Student Lounge and restrooms have been upgraded.
- The Clinical Skills Lab has been developed.
- The Center for Excellence & Office of Admissions have been relocated to space contiguous with the Office of Student Affairs.

Planned renovations (ideally completed by Summer of 2003):

- The M-Wing classrooms will be renovated during the next two summers.
- The Fleischmann Teaching Labs will be renovated.
- 24 –hour small group study rooms and a reading room in Lane Library will be developed.
- Fairchild Student Lounge will be renovated.
- A Center for Simulation Education in Medicine will be created.

In addition, I also announced to the Senate the beginning of our program planning for the Stanford Medicine Information and Learning Environment (SMILE), which will be led by an Executive Steering Committee that I will chair. Other members of the SMILE Executive Steering Committee will be Senior Associate Deans Julie Parsonnet, James Nelson, Henry Lowe and Michael Hindery; Mr. David O'Brien, Director of Institutional Planning; Dr. Lorry Frankel, Chair of the Faculty Senate; Mr. Charlie Brown, Director of the Campaign for Stanford Medicine; Ms. Nancy Tierney, Director of Facilities Planning and Ms. Maggie Saunders, SMILE Program Director. Ms. Beverly Simmonds, Special Assistant to the Dean, will staff the Steering Committee.

Subcommittees that will be comprised of faculty, students and staff will address key areas including Instructional and other Education Support Space and Technology, Lane Library and Information Services, Learning Information Technology and IT Infrastructure, Student Resources, Affairs and Amenities. We currently plan to complete the concept development phase of this project by the end of this year with the goal of presenting the conceptual plans to the Board of Trustees in February, 2003.

Further Progress on Bioengineering

On Tuesday, May 14th, Dean Jim Plummer and I met with the University Advisory Board to present the concept proposal for the joint Department of Bioengineering. The Board recommended approval of the concept for the new Department. Dean Plummer and I will next make a presentation to the University Board of Trustees on June 13th. Additional details will be provided as they become available.

Bicycle Safety on Campus: Some Progress

“In the plaza and along the walks, their ten-speed bicycles come up behind you silently and swiftly, and without bell or warning whiz by you within two feet at twenty miles an hour, leaving you with a cold shock of adrenalin in your guts and a weakness in your knees...”

From Wallace Stegner, *The Spectator Bird*, 1976

Amazingly, a quarter of a century later, Joe Allston's experience in traversing the Stanford campus in “The Spectator Bird” is easily recounted without change today – except for the speed and number of the bicycles!

I have previously written about my serious concerns regarding bicycle safety on the Stanford Campus. Fortunately, Phil Ecker, President of SMSA, along with David Silberman, Director of Health and Safety for the School of Medicine, and Ariadne Scott, Bicycle Program Coordinator for Stanford University, have made important progress in improving bicycle safety. A special Bicycle Medicine Workshop was held on Friday, May 17th, in the Dean's Courtyard demonstrating this progress. In addition to providing education and a raffle of helmets, locks, lights and related paraphernalia, a report of the significant accomplishments to date in improving safety were outlined, including:

- Completion of a major sweep of abandoned bicycles in the Medical Center/Hospital area, in tandem with the Stanford Department of Public Safety
- Continued monitoring for abandoned bicycles
- Collaboration with the Planning Department and MSOB staff on installation of new bicycle racks along Governor's Lane, MSLS and the Redwood Bldg
- Relocation of bicycle storage lockers to the Falk lot for convenience to Lucile Packard Hospital
- Coordination of the Affordable Helmet Purchase Program for Medical Students with the Campus Bike Shop and Health and Safety Program
- Distribution of Parking & Transportation Services' Bicycle Program safety giveaways (reflective leg bands, rear LED lights and water bottles) at the Bicycle Medicine Seminar
- Coordination of FREE Bicycle Safety Checks and Tune-ups for Medical Student's bicycles at the Bicycle Medicine Seminar

In addition to these accomplishments, several other important projects are underway including:

- Evaluation of the installation of new bike racks at the Stone Complex (in front of the School of Medicine along the Quarry Road extension)
- Installation of a new secure bicycle storage facility inside the new Stock Farm Parking Structure (ground floor)
- A multi-city bicycle map project is underway with the cities of Menlo Park, Palo Alto, East Palo Alto and Stanford to indicate safe bicycle routes and interconnectivity with the Stanford Campus
- Installation of Temporary Suggested Bike Route Signage in Construction Areas (these map out recommended safe bike routes in construction areas and addresses access/detours in construction areas)

While the progress in the Medical Center is gratifying, I also hope that significant improvements will occur throughout the campus, especially among undergraduates who rarely seem to wear helmets, use hand-signals or use lights at night. Clearly work needs to be done – and hopefully our Medical School students can serve as educators and role models. Wallace Stegner would be happy even from his loft perch.

Events

- **Thank You to Donors Supporting our Students: Student Financial Aid Dinner:** On Thursday, May 16th, the Annual Student Financial Aid Dinner was held in the Faculty Club to honor the many wonderful individuals who have provided financial support enabling our medical students to reduce the extraordinary indebtedness now associated with attending medical school. Thanks to the history of generous contributions for student aid, the graduates of Stanford School of Medicine now have the lowest level of debt burden in the nation, although this indebtedness still averages \$66,381. The financial aid offered to Stanford students is also largely in the form of grants, making the debt

burden even less. Clearly this helps us to attract among the best and brightest students to Stanford. Equally importantly, it enables our graduates to make their future career choices in a manner less encumbered by financial worries and hopefully more directed by their personal and professional goals and aspirations.

One of the very special features of the Student Financial Aid Dinners are the presentations by students about the impact of Stanford and financial aid on their lives and future careers. Certainly every one of the students attending this event could offer a compelling and meaningful story. Representing the students this year were three such students: Emily Keifa SMS II, Matt Mendenhall, SMS II and Adeunice Sanchez-Mata, SMS V. Each of these students brought joy, tears and respect to the eyes of their donors and to all in attendance. In many ways, these students, and indeed all of our students, remind us of why we are proud to be at Stanford.

I also want to thank those who make this program possible, especially the counselors and directors of Student Financial Aid and to the wonderful members of the Office of Medical Development who helped plan this special event, especially Bruce Bingham, Jackie Brown, Dolly Patterson and her events staff.

- **Baxter Laboratory Celebration:** On Tuesday, May 14th, we were joined by the officers and trustees of the Baxter Foundation to celebrate the official naming of the Donald E. and Della B. Baxter Laboratory in Genetic Pharmacology, housed within the Department of Microbiology & Immunology and located in the CCSR building. Dr. Helen Blau serves as the first Director and was joined by Dr. Gary Nolan for the celebration. The trustees expressed their esteem and respect for the work going on at Stanford in general, and in the Baxter Laboratory specifically. We are deeply indebted to the Baxter Foundation for their continued generosity to Stanford and for their support in enabling us to found the Baxter Laboratory in Genetic Pharmacology. It is also worth noting that Dr. Blau has been elected to be the President of the International Society of Differentiation for 2004.
- **2nd Lawrence G. Crowley Distinguished Lectureship:** On Friday, May 17th, I had the honor and privilege to deliver the second Lawrence G. Crowley Distinguished Lectureship on the “State of the School: The Future of Stanford Medicine and its Relevance to Pediatrics”. It was a particular privilege to deliver this lectureship in honor of Dr. Crowley who, during his tenure as Vice President for Medical Affairs and acting Dean of the School of Medicine, made possible the formation of the Lucile Packard Children’s Hospital and its important partnership with the Stanford University School of Medicine.
- **Lucile Packard Children’s Hospital Founder’s Day Celebration:** On May 15th, LPCH held its Annual Founder’s Day Celebration in the Faculty Club to thank the many wonderful members of the community who have supported LPCH. During the last decade, the Lucile Packard Children’s Hospital has grown to become one of the leading centers of excellence in pediatric medicine and surgery. Based on

the work now underway and the splendid faculty joining LPCH, it is clear that LPCH will be one of our nation's premier centers of excellence for pediatrics. The association of LPCH with Stanford, championed by Dr. Larry Crowley (see above) has helped to make this possible.

Announcements

The Department of Medicine has announced that its Division of Infectious Diseases and Geographic Medicine has established a new consultation service to provide clinical consultation on immunocompromised patients with infections, including solid-organ transplant recipients, patients with cancer or neutropenia, and patients receiving immunosuppressive therapy. Dr. Jose G. Montoya will lead the new service. For in-patient consultation, you may reach the ICH service through the ID Fellow on call, Stanford Page (723-8222 pager #14031). For outpatients, please contact Dr. Montoya directly, Stanford Page (723-8222 pager #13835) or the ID clinic outpatient nurse at 650-498-7795.

Congratulations

- **Dr. Jack Remington.** On May 23rd, Dr. Jack Remington, Professor of Medicine and the Marcus A. Krupp Research Chair of the Department of Immunology and Infectious Disease, Research Institute of PAMF, was named the 14th recipient of the Albion Walter Hewlett Award in recognition of his long and significant contributions to the Department of Medicine and Stanford University. Dr. Remington also delivered Medical Grand Rounds on a topic he is internationally recognized for: "Cats, Pregnancy, Heart Transplantation, and AIDS—A Lifelong Journey with Toxoplasma and Toxoplasmosis". In addition to his celebrated contributions as an investigator and clinician, Dr. Remington is respected worldwide as a teacher, educator and mentor. Graduates of his laboratory now lead divisions and departments around the world and all share deep affection for him and his support. On a personal note, although I was not fortunate enough to be a fellow with Dr. Remington, I was "adopted" by him early in my own career and can attest, on a very personal level, what an extraordinary mentor and colleague he is to young investigators. He is most deserving to be the recipient of this year's Albion Walter Hewlett Award. Congratulations Jack!
- **Dr. Irv Weissman.** Each year the California Science Center commissions a blue-ribbon panel to select one scientist whose current work is advancing the boundaries of any field of science. On May 9th the California Science Center announced the selection of Irving L. Weissman, M.D., the Karel and Avice Beekhuis Professor of Cancer Biology and Professor, by courtesy, of Biological Sciences, as this year's recipient of the California Scientist of the Year Award. Dr. Weissman is being recognized for being the first to isolate the hematopoietic stem cell in both mouse and man, which has led to dozens of new experiments exploring the cell's power to fight an array of illness, such as cancer and

Parkinson's disease. This is an important breakthrough that may pave the way for development of novel treatments for a wide range of illnesses. Congratulations to Dr. Weissman for this outstanding honor. Please also remember that Dr. Weissman will be our School of Medicine Commencement Speaker this year on June 16th. I hope you will join us for those important festivities.

- **Dr. Stanley Schrier.** It is a great pleasure to let you know that Dr. Stan Schrier, Professor of Medicine, will be awarded the 2002 Walter Gores Award for outstanding teaching at this year's Stanford University Commencement. He is being cited for his four decades of teaching students, housestaff, fellows and faculty at the School of Medicine, for being an outstanding clinician and for inspiring generations of physicians throughout the nation. Congratulations to Dr. Schrier.
- **Carole Buffum.** I am very pleased to report that Ms. Carole Buffum, Executive Director of Finance and Administration, will receive the Cuthbertson Award at this year's Commencement ceremony. The Cuthbertson Award is presented annually by the University to an exceptional staff member in recognition of her or his leadership and service to the University. This is an outstanding accomplishment that brings great credit to Ms. Buffum and to the School. It bears mentioning that, Perry Everett, Controller for the School of Medicine, also won the Cuthbertson Award two years ago. Please join me in extending our respect and congratulations to Ms. Buffum.
- **Office of Communications and Public Affairs.** I have just learned that staff from the Office of Communication & Public Affairs have been recognized this month by their peers nationally for their writing and design talents. The Council for the Advancement and Support of Education (CASE) in Washington, D.C. has awarded Stanford Medicine a gold medal for Visual Design in Print/Covers and a silver medal for the magazine's quality overall. Stanford Medicine magazine received additional recognition from the Society of Publication Designers who chose the cover from the Winter/Spring 2001 issue for their Merit Award. The cover artwork will be on display in New York City at Parsons School of Design this fall. Please join me in congratulating our staff in Communication & Public Affairs

Appointments and Promotions

- **Todd F. Alamin** has been appointed Assistant Professor of Orthopedic Surgery, 6/1/02-5/31/05
- **Sungho Charles Cho** has been appointed Assistant Professor of Neurology and Neurological Sciences and, by courtesy, of Neurosurgery, 6/1/02-5/31/05
- **Rebecca Fahrig** has been appointed Assistant Professor of Radiology (Research), 6/1/02-5/31/05

- **Quynh-Thu Le** has been promoted to Associate Professor of Radiation Oncology at SUMC, 6/1/02-5/31/07
- **Daniel Murphy** has been appointed Associate Professor of Pediatrics at LPCH, 6/1/02-5/31/07
- **Richard Reimer** has been appointed Assistant Professor of Neurology and Neurological Sciences, 6/1/02-5/31/05
- **Robert Shafer** has been appointed Assistant Professor of Medicine (Infectious Diseases & Geographic Medicine) (Research), 6/1/02-5/31/05

Congratulations to all.

Dean's Newsletter

June 10, 2002

Commencement

Sunday, June 16th is commencement and I hope as many of our students and faculty will attend as possible. In addition to the University Commencement Exercises that will be held in the morning, our School of Medicine Commencement activities will begin at 2:00 p.m. on the Dean's Lawn. This year's commencement speaker is Dr. Irving L. Weisman, Karel and Avice Beekhuis Professor of Cancer Biology and Professor, by courtesy, of Biological Sciences. A special issue of the Dean's Newsletter on June 17th will cover Commencement events.

Graduation ceremonies will be webcast live on Sunday:

<http://www.med.stanford.edu/lane/ifo/graduation2002.html>

Note: This page will automatically launch Real Player and play a test pattern video clip for testing purposes until the day of the ceremony.

10th Anniversary Celebration of the Richard M. Lucas Center

On Friday May 31st, the Department of Radiology and Stanford Medical School celebrated the 10th Anniversary of the Richard M. Lucas Center. It was a wonderful celebration made possible by the generous support and contributions from the Lucas family, creating a synergistic partnership with industry, the NIH, NSF and academia. It was also an opportunity to recognize the vision and creativity of Dr. Gary Glazer, Professor and Chair of the Department of Radiology, for his leadership and contributions. Indeed, during the past decade both the Department of Radiology and the Richard M. Lucas Center for Magnetic Resonance Spectroscopy and Imaging have been in the forefront of advanced imaging technology. In addition, special recognition also goes to Professors Gary Glover, Norbert Pelc and Bob Herfkens, who joined Dr. Glazer to help establish the Lucas Center a decade ago.

The Lucas Center Celebration included an afternoon symposium that was introduced by President John Hennessy and featured William Brody, M.D., Ph.D., President of the Johns Hopkins University, Erich R. Reinhardt, Ph.D., CEO and President of Siemens Medical Solutions, Jeffrey R. Immelt, MBA, Chairman and CEO, General Electric along with David Botstein, Ph.D., Professor of Genetics, Stanford W. Ascherman, M.D., Alan M. Garber, M.D., Ph.D., Henry J. Kaiser, Junior Professor and Director, Center for Health Policy and Gary M. Glazer, M.D., Professor and Chair, Department of Radiology.

In addition to the scientific presentations, posters and tours demonstrating the many accomplishments of the Stanford Radiology community, a lovely dinner celebration was held in the Arrillaga Alumni Center that was attended by leading members of the imaging and biotechnology community along with the Lucas family and the many friends and colleagues of the Department of Radiology and Stanford. It was truly time to celebrate the accomplishments of Stanford faculty and the leadership of Dr. Glazer in particular along with the generous contributions from the Lucas family and from industry. Of note, a proposal to expand the Richard M. Lucas Center to accommodate a new 7T magnet will be reviewed by the Board of Trustees on June 13th.

Budget and Financial Planning Process Underway

Although the weeks following commencement offer a more quiescent time for the rest of the university, they are among the busiest for the School of Medicine's Department leadership and Dean's office as we review and finalize the FY03 budget. We have initiated this process and it will proceed through early August. As we do so, it is clear how very hard our faculty and staff is working to fulfill the missions of the School and Medical Center. It is also clear that despite the progress being made we are in a very challenging economic period. The downturn in the economy has impacted the School of Medicine in the same manner that it has impacted the rest of the University. Although both Stanford Hospital & Clinics and Lucile Packard Children's Hospital are performing significantly better than a year ago, both also face continued financial challenges consequent to poor reimbursements and increased labor costs. Accordingly, we will need to be even more careful and selective in planning our strategic initiatives and investments. Sadly this also means that we are less able to provide the financial rewards commensurate with the important contributions of our outstanding staff within the School. That said, I do want to thank the members of our Medical School community for working so diligently to make Stanford the best it can be.

Stanford Hospital & Clinics Semi-Annual Medical Staff Meeting

I had the pleasure of introducing Ms. Martha Marsh, President and CEO of Stanford Hospital and Clinics (SHC) to the attendees of the Semi-Annual Medical Staff Meeting on Tuesday, June 4th. Ms Marsh reviewed the mission and principles for SHC as well as the current state of strategic planning. She proffered that SHC was too small and, overtime, would require increase in bed capacity (it has more licensed beds than it is

currently using) as well as renovation of ICUs and operating facilities. She also focused on the importance of quality and service performance for patients, physicians, staff and those who refer patients to SHC. She underscored the ability to demonstrate to our internal and external communities those areas of clinical practice and innovation that SHC performs uniquely or better than others and that prompts patients to come to SHC for their care. She also noted that the financial performance of the Hospital and while underscoring the improvements that have occurred since a year ago she reinforced the many challenge that lie ahead – however, she emphasized her belief that the Hospital will be successful and that she is committed to working with the physicians and staff to make it so.

Brief Progress Report on the Clark Center

Next week will mark the anniversary of the construction of the Clark Center, which began on June 18, 2001. As is evident, considerable progress has been made and the building is scheduled to open next May-June. Thanks to the leadership of Dr. Matt Scott and Beth Kane, and their close work with the Deans of the Schools of Medicine, Engineering, H&S, and Environmental Sciences, significant progress has also been made in defining the areas of research concentration within the Clark Center as well as the faculty who will be its first incumbents. Importantly, they will include a mixture of newly recruited faculty as well as individuals who are already part of the Stanford community. All faculty will of course maintain the departmental appointment with the express goal that the interactions and collaborations within the Clark Center will extend to faculty in departments across the University. It is shaping up to be an exciting intellectual environment that should serve as a model for multidisciplinary research. Dr. Scott is scheduled to give an update on the Clark Center and BioX to the University Senate of the Academic Council on Thursday, June 13th.

Executive Committee: Update on the Professoriate

At the Executive Committee meeting on Friday, June 7th, a preliminary report was presented about the professoriate by Dr. David Stevenson, Senior Associate Dean for Academic Affairs along with Ms. Linda Deasy, Assistant Dean for Academic Affairs and Dr. Maurice Druzin, Associate Dean for Academic Affairs. Since last fall, a Work Group led by Dr. Stevenson has been reviewing the School of Medicine professoriate and since the Strategic Planning Retreat in February, has focused more specifically on the Medical Center Line faculty and the Voluntary Clinical Faculty. The overarching goal has been to develop an appointment and promotion system that values a community of excellence and the important contributions made by full-time faculty and staff physicians as well as community physicians who contribute to our academic missions in education and research as well as outstanding patient care. For example, this may include eventually criteria for “Investigator”, “Clinician/Scholar”, “Clinician/Educator” and “Voluntary Clinical Faculty”. The Committees led by Dr. Druzin are developing both recommendations for faculty titles for full-time Stanford employees as well as for community physicians, along with clearer criteria for appointment and promotion. Based

on the progress report presented on June 7th, we anticipate that this important work will be completed during the summer and announced as soon as it is approved.

In addition to focusing on the appointment and promotion criteria and titles, Ms. Deasy and Dr. Stevenson are also examining ways to accelerate the time to completing appointments and promotion. Ms Deasy has done an analysis of the last 204 faculty actions since she assumed her responsibilities as Assistant Dean for Academic Affairs and has examined the time involved in approvals from the Dean's Office versus those spent on the Search Process or preparation of the "long-forms" within the Departments. This analysis has revealed a number of opportunities for improvement and Ms. Deasy and Dr. Stevenson will work with Department Chairs and administrative staff to help expedite the work within Departments and the Dean's Office to shorten the time to appointments and promotions.

Meeting with the Committee on Women in Medicine and Science

On Wednesday, June 5th, I met with the Committee on Women in Medicine and Science to review the results of their report in anticipation of its presentation to the Senior Associate Deans and the School of Medicine Executive Committee during the next weeks. The Committee has included: Merlynn R. Bergen, Ph.D., Medicine (consultant to the Committee), Robyn L. Birdwell, M.D., Radiology, Michael L. Cowan, Associate Dean for Postdoctoral Affairs, Teri A. Longacre, M.D., Pathology, Yvonne A. Maldonado, M.D., Pediatrics, Suzanne R. Pfeffer, Ph.D., Biochemistry, Mary Lake Polan, M.D., Ph.D., MPH, Gynecology and Obstetrics, Martha K. Terris, M.D., Urology, Lucy S. Tompkins, M.D, Ph.D., Medicine (Infectious Diseases), Hannah A. Valentine, M.D., Medicine (Cardiovascular), and Eva E. Weinlander, Medicine (Family and Community). I want to thank each of these individuals for their dedicated work and commitment. Once their report and recommendations have been presented to the Executive Committee I will be pleased to bring you an update – and more importantly, our plans for implementing their recommendations.

I did take the opportunity to discuss with the Committee their perceptions about the work environment at Stanford and my commitment to doing everything in my power to assure that the School of Medicine is a respectful workplace. I also underscored the zero-tolerance position of the Dean's Office to any forms of discrimination or harassment. The suggestion was made by the Committee that I hold a Town Meeting for women faculty to discuss this further and how we can continue to improve it. We will plan that Town Meeting, likely for early Fall – and I will let you know the date and time as soon as that has been finalized.

Strategic Planning for Lucile Packard Children's Hospital

Last year the Lucile Packard Children's Hospital (LPCH) celebrated its 10-year anniversary. During the past several years, LPCH has also been planning its future to assure that it achieves both preeminence and sustainability during this next decade. On

Friday, June 7th, a Retreat for the Board of Directors of LPCH was held to review the strategic planning process and address both the opportunities and challenges that lie ahead. Mr. Chris Dawes, President and CEO of LPCH, reviewed the overarching objectives with the Board members, included continuing the path now in progress of establishing internationally recognized Centers of Excellence in Brain and Behavior, Cancer, Heart, Obstetrics/Neonatology, Pulmonary/Cystic Fibrosis, and Transplant/Tissue Engineering. In addition to the major progress already achieved in solid organ transplantation and obstetrics/neonatology (through the Johnson Center), this past year has seen remarkable progress in the Heart Centers. Over the next couple of years it is anticipated that similar progress will occur in Cancer, Pulmonary and Brain & Behavior. Achieving preeminence in these Centers of Excellence is facilitated by the extraordinary support made possible through the Children's Health Initiative led by Dr. Alan Krensky, Professor of Pediatrics

Complementing the Centers of Excellence are efforts to further develop and improve both medical and surgical subspecialties as well as enhancing the important role that LPCH plays as a provider of comprehensive pediatric services to its local communities. During the past year, the patient volumes have increased significantly at LPCH. While the rapid development of the Heart Center over the last month has contributed to this most notably, patient volumes have been high throughout LPCH and, understandably, have significantly increased the work demands of faculty, staff and trainees. These demands make it clear that LPCH has a significant capacity limitation and one of the most important challenges will be finding ways to deal with the current limitations of both space and personnel. Importantly, it is clear that the services provided by LPCH are highly valued and that during this next decade LPCH will emerge as one of our nation's leading centers for the care of children. Achieving this excellence, which is important for the health of children locally as well as nationally, engenders a number of challenges that must be overcome. We are committed to help LPCH achieve the fulfillment of its mission of preeminence and sustainability.

Without question, one of the most important factors contributing to the excellence and success of LPCH is its relationship with the School of Medicine and SHC. Accordingly, strategic planning across the Medical Center is essential to assure that our goals, objectives and prospects for excellence are aligned and coordinated. I am pleased to say that we are working diligently to assure that these alignments occur – for the excellence of our institutions and for the communities they serve.

Announcements

- ***Appointment of Greg Barsh as MD/PhD Program Director.*** I am pleased that a Search Committee lead by Drs. Julie Parsonnet, Senior Associate Dean for Medical Student Education and James Nelson, Senior Associate Dean for Research, Graduate Education and Postdoctoral Affairs has selected Gregory Barsh, M.D., Ph.D., Professor of Pediatrics and Genetics, as the next Director of the Medical Sciences and Technology Program at Stanford. Dr. Barsh will commence his responsibilities on July 1, 2001. He will succeed Mark Krasnow,

M.D., Ph.D., who has served with great distinction as Director of the MSTP Program. As you know, we are planning to expand the MD/PhD programs for our students and I am enormously pleased that Dr. Barsh will serve as Director during this important time.

- ***Appointment of Terry Blaschke as Associate Dean for Medical Student Advising.*** I am very pleased to announce that Dr. Terry Blaschke, Professor of Medicine, has accepted Dr. Julie Parsonnet's invitation to serve as Associate Dean for Medical Student Advising. Dr. Blaschke is widely recognized as a wonderful teacher and mentor as well as an outstanding investigator. He will clearly play an important and highly valued role in advising our medical students.

Congratulations to Dr. Emmanuel Mignot

On May 28th, the Howard Hughes Medical Institute announced that Emmanuel Mignot, M.D., Ph.D, Professor of Psychiatry and Behavioral Sciences, was selected to be one of the newly appointed investigators in an innovative program to improve the translation of basic science discoveries into enhanced treatments for patients. Dr. Mignot joins 11 other physician-scientists selected from 138 applicants from 119 institutions who were selected through a rigorous review process. These new investigators in Patient-Oriented Research will join the 324 HHMI Investigators across the United States, 13 of whom are at Stanford.

Dr. Mignot is internationally recognized for his studies in sleep disorders, especially narcolepsy. He and his colleagues have identified a faulty neuropeptide system that induced narcolepsy in experimental animal models. He has demonstrated that hypocretins are absent in the brains of patients with narcolepsy. He and his colleagues are studying the pathophysiology of narcolepsy with the hopes of improving a number of sleep disorders that affect humans.

Congratulations Dr. Mignot!

Appointments and Promotions

- **Anthony Burgos** has been appointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital at Stanford University, effective 6/1/2002.
- **James Chang** has been promoted to Associate Professor of Surgery (Plastic and Reconstructive) at the Palo Alto Veteran's Affairs Health Care System, effective 6/1/2002.
- **Terry Dresser** has been appointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 6/1/2002.
- **Christina Mora Mangano** has been reappointed to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 6/1/2002.
- **Minnie Sarwal** has been reappointed to Assistant Professor of Pediatrics (Nephrology) at the Lucile Salter Packard Children's Hospital at Stanford University, effective 6/1/2002.

- **Hannes Vogel** has been appointed to Associate Professor of Pathology at the Stanford University Medical Center, effective 6/1/2002.
- **Sherry Wren** has been promoted to Associate Professor of Surgery (General Surgery) at the Palo Alto Veteran's Affairs Health Care System, effective 6/1/2002.

Dean's Newsletter

June 17, 2002

Special Commencement Issue

On Sunday, June 16th, Graduation Exercises were held for Stanford University and for the School of Medicine. In addition to the University Commencement Ceremony, the School of Medicine held its own celebration and diploma-awarding event on the Dean's Lawn on Sunday afternoon. This year, the School presented 37 Master of Science degrees, 72 Doctor of Philosophy degrees and 92 Doctor of Medicine degrees. Among these, students received combined degrees, including nine MD/PhD degrees, two MD/Master degrees and one MD/MBA.

We all join together in extending our personal congratulations to each and every graduate and to their parents, families and friends. What a wonderful accomplishment by all.

Faculty Awards

In addition to congratulating our students for their accomplishments, commencement is also a time to honor faculty who have made significant contributions to their education. Accordingly, I am pleased to list the teaching awards that were announced at the School of Medicine Commencement.

The Arthur L. Bloomfield Award: In Recognition of Excellence in the Teaching of Clinical Medicine

James Baxter, Medicine

John J. Jernick, Family Medicine

Erika Schillinger, Family Medicine

The Henry J. Kaiser Family Foundation Award: For Outstanding and Innovative Contributions to Medical Education

James Hallenbeck, General Internal Medicine

The Henry J. Kaiser Family Foundation Award: For Excellence in Preclinical Teaching

Neil Gesundheit, Medicine

Seung K. Kim, Developmental Biology

Julie Parsonnet, Health Research and Policy
Robert Siegel, Microbiology and Immunology

The Henry J. Kaiser Family Foundation Award: For Excellence in Clinical Teaching

J. Edwin Atwood, Cardiovascular Medicine
James Baxter, Medicine
Sherry M. Wren, General Surgery

The Franklin G. Ebaugh, Jr. Award: For Advising Medical Students

Sherry M. Wren, General Surgery

The Compassion in Medicine Award

Elliott Wolfe, Medicine

The Alwin C. Rambar-James B.D. Mark Award: For Excellence in Patient Care

Michael D. Amylon, Pediatrics

Stanford University School of Medicine Award for Graduate Teaching

Timothy P. Stearns, Biological Sciences and Genetics

Stanford University School of Medicine Award for Outstanding Service to Graduate Students

Phyllis I. Gardner, Molecular Pharmacology and Medicine

Congratulations to all.

Address to the Graduates

One of the traditions of the School of Medicine Commencement is a presentation by an elected member of the Graduate and Medical Student graduating class. This year, Lauren Ilyse Richie Ehrlich, graduating with a PhD in Immunology and Joel and Adeunice Sanchez Mata, graduating with MD degrees, spoke to the graduates and guests. Their remarks follow:

Address by Lauren Ilyse Richie Ehrlich

Let me start by saying Congratulations to my fellow graduate students of the class of 2002! We certainly did not matriculate as a single class, but we're here together at this moment to celebrate the culmination of our graduate careers. We've made it! We've made it through the bright-eyed bushy-tailed I'm going to publish at least on Science, Cell or Nature paper a year phase. We've made it through the post-qualifying exam nothing-is-ever-going-to-work-again slump phase. And we've made it through the final exhilarating phase of data collection, analysis, and thesis writing that enabled us to walk across this stage today.

But appropriately we're here at a "commencement" ceremony and not a "termination" ceremony. Even after all of these phases of graduate school, the next phase of our lives, the phase that will open our career paths, has yet to be determined. Some of us will continue in academics as postdoctoral fellows, reaching for that elusive faculty position so that we may continue to pursue basic research and train up-and-coming scientists. Some will go into industry to contribute to drug development and clinical trials. Others will enter the political arena of science advising where they may help to shape the very policy that enables us to carry out our research. And yet others will pursue myriad different careers.

Regardless of the path each of us chooses, we have the opportunity, and I would argue the responsibility to make important contributions in our fields. The last year has highlighted the importance of bio-medical research and policy in our society. From the stem cell debate and related cloning issues to increases in political and financial support for anti-bioterrorism efforts, we have seen biology-related issues enter the homes of Americans all over this country. Often it has been clear that there is public misunderstanding about the findings and promise of biomedical research. We have been given an incredible gift: we have been given the opportunity to begin maturing as scientists at Stanford University. With that gift comes the responsibility to give something back to our society, be it in the form of additional scientific advances, political policy, or direct medical applications.

Fortunately, we have had the opportunity to learn from some of the brightest and most successful scientists in the world, who have shown us by example how to contribute both to scientific advances and to public policy. Our professors have taught our classes and led and shaped the laboratories in which we carried out our thesis projects. They have exemplified what it takes to be successful scientists. Perhaps most importantly, we have had the opportunity to learn from them as people. Many if not most of our professors have unique personality quirks that separate them from your average Joe or Jane. And for those of you who have witnessed the Microbiology and Immunology Christmas skits, you know that those quirks have not gone unnoticed. Yet these unique personality traits have often inspired us and pointed us toward what I consider to be one of the most important lessons in graduate school: a successful scientist is not one who follows meekly in the footsteps of past progress, but is rather one who pushes forward into uncharted territory. Science is not for followers (as my advisor Mark Davis has told me in the past); it is for people who are willing to take a risk, try something new, and perhaps discover something important. After all, weren't some of our most fulfilling graduate school moments those in which a new and perhaps improbable experiment actually worked? And how many of us went stubbornly forward with those experiments even though others doubted them? We are graduating today because we have learned to have the courage to think of a new question, dream up an experiment to address it, and actually carry that experiment to fruition. It is this independence and creativity, often associated with a certain amount of our own quirkiness, that our Ph.D.s acknowledge. And it is these traits that will allow us to go into our chosen careers with confidence that we can be leaders and that we can make a difference.

I think a fortune that I recently received in a cookie at the Szechwan Cafe sums up the outlook of a successful graduate student, and so I will close by paraphrasing it: We delight in doing what others proclaim can not be done.

Address by Joel and Adeunice Sanchez Mata

The excitement felt here today represents an acknowledgement of achievement and the culmination of years of learning. It represents the foundational step along the path to greater accomplishment. Today is our day to stand and be recognized. As we enter robed in formal academic regalia signifying academic success, we become part of a proud tradition of Stanford educated men and women who have pioneered discoveries and have left lasting contributions to their communities and to the lives of individual patients. We will be congratulated by friends, embraced by family members and applauded as we walk across the stage to receive our diploma. The celebration today symbolizes that we now possess the understanding, determination and compassion to be committed physicians, teachers and scientists.

Let me begin today by expressing how fortunate I am to have shared the last several years with you, peers who I consider to be the best group of medical students in the country. We have spent these past four, five and more years, learning the intricacies of medicine and how to respectfully care for others. We learned how to camp together the first days of medical school. We learned there are seemingly an infinite number of names to the vast components of the human body. We learned of the critical importance of biostatistics. We learned from Dr. Cross' kind and openhearted ways. We learned to mourn the loss of Dr. Glasgow, a great and eccentric individual and beloved Anatomy professor. We consistently experienced Dr. Wolfe's compassion; from him, we learned how to advocate and actively care for others. We have learned an approach, a style if you will, to the art of medicine. We have learned where in the hospital to find free food, how to build strong relationships with Citibank and American Express and how to wipe out multiple savings accounts efficiently. We have learned to form bonds that will always tie us together and will last a lifetime. Lastly, we have learned that all good things must come to an end.

As this day was fast approaching, we began to feel more and more nostalgic, filled with bittersweet anticipation. Our conversations invariably revert to stories of particular encounters with patients; we realized how unknowingly, patients contributed to our lives and have shaped the kinds of physicians we were becoming. These seemingly simple, largely unnoticed interactions brought with them a wealth of emotion and affirmation of why we chose this career path many years ago. It allows us to give back what others have given us. I remember one such patient.

One morning, while hurriedly following my team during morning rounds of my four-week rotation of Internal Medicine, I was assigned an elderly woman with a chronic medical condition. Upon entering the room with the team, I went to her bedside, outstretched my hand and introduced myself in a polite, yet professional manner, "Eunice

Mata, medical student.” “Francisca,” she replied with a heavy Spanish accent and a warm smile “itz a playzure to meet you.” Although both hands held the bed sheets over her shoulders, I could see she had a stout build. She had beautiful long silver-white braids that bordered her round, dark brown Indian face. Her many wrinkles made her look much older than her seventy-two years, I thought to myself. When she smiled, her brown eyes all but disappeared into thick lines, reminding me of my own grandmother.

The rest of the team quickly introduced themselves and she was told, while team members approached from both sides of the bed, in one word “Franciscaunlessyouhaveanyobjectionsweregoingtoexamineyounow.” At the head of the bed, with stethoscopes drawn, we quickly positioned our instruments over the appropriate points for a thorough cardiac exam. (Place hand in air as if auscultating.) Following the attending physician’s experienced lead, we re-positioned our stethoscopes every couple of seconds, tracing a cutaneous map of atria, valves and ventricles (move your hand appropriately). More concerned with moving at the appropriate time and in the right direction, I did not always give myself the opportunity to listen. I was sure I was the only medical student who had not yet learned how to do a thorough cardiac exam. Wait a moment, I thought, I think I hear something, or is it my hand moving while touching the stethoscope, me shifting position or am I applying too much pressure or not enough pressure? Is my breathing really this loud? I stopped all motion and held my breath and focused on what might be a faint woosh-woosh. In my excitement, I failed to realize that mine was the only stethoscope still touching the patient’s body.

“Well, what do you think of the murmur?” asked my supervising attending.

Ok, I thought to myself, so there must have been a murmur. Avoiding eye contact, I repeated the description to the only murmur I could remember, “Ahh, 2 out of 6 systolic murmur, non-radiating, loudest at the left sternal border-I think.” There was a silent pause as (place your hand up, as if auscultating). In an attempt to redirect the group’s attention, I focused on repositioning my instrument. “Try listening over here,” was the response as the attending moved my stethoscope to a new position (reposition your hand). “It’s faint but you should be able to hear it.” “Ahhhhh, ok, un-huh, now-wait, ok, I must have missed it the first time”-- a phrase I became quite familiar with when practicing physical exams with attendings.

Upon finishing the exams Francisca was told the medical plan for the day and was asked if she had any questions. She smiled. We all exchanged glances and began filing out, first the attending and next the resident. As I exited the room last, I noticed a peculiar look on her face. It wasn’t until I returned later that morning that I realized that the quizzical look meant that she did not understand much of her hospital plan. As it turns out, Francisca spoke very little English and was embarrassed to tell us, so I explained the plan again in terms she could understand. Over the next couple of weeks, as expected, her hospital course gradually improved and my morning visits became a welcome part of my daily routine. Some mornings, our discussions of medical plans would stray and she would talk to me about her grandchildren and great grandchildren and how she dreamed they would someday become doctors too. Experiences in her past reminded me of stories

I'd heard passed down in my own family. Tales of how my own grandmother, Aurelia, in her mid-twenties had taken seven days to cross parts of the Sierra Madre on foot, pregnant with my uncle, Jesus, my mother, who was then 2 and her three other children.

Some mornings Francisca would cry, sometimes out of apprehension of planned invasive procedures, other days while expressing her fear and frustration regarding her medical condition. Those mornings, I would sit at her bedside, listen and hold her hands, trying to convey some sense of comfort and security.

As the weeks went by our relationship strengthened and I knew it would be difficult to say goodbye. I thought of different ways of how best to say goodbye and wish her the very best of luck. The morning of my last day as I sat at her bedside, we each expressed how much we enjoyed having become friends. Over the course of the month, I gave her the freedom to express herself fully and she allowed me to better define the kind of doctor I wanted to be. We both cried. I assured her that things were going to be okay and she would have wonderful caring doctors looking after her health. As I rose to leave, she said to me, after taking hold of my hand and holding it over her heart, "Eres mi angel", "you are my angel." For the next several days I had a smile on my face, not for the difference I had made in Francisca's life, but for the change she had made in mine.

I use this story to illustrate how seemingly commonplace, day-to-day experiences will define the way we practice medicine. Each patient gives us the opportunity to reaffirm to ourselves and to others the kind of doctor we aspire to be. Each act and interaction define the type of physician are becoming.

Poet Robert Penn Warren once said, "A poem is not a thing we see; it is, rather, a light by which we may see." Our diploma, you see, is much the same thing. Not a thing we frame and look at, it's an avenue, a ticket that allows us to serve others in constructive ways, and in turn, potentially gives tremendous meaning to our daily lives. We are now vehicles to guide others to health and well-being. Our challenge is to strengthen the health of all communities so that everyone can share in the opportunities of the 21st century.

This ceremony today really has only one purpose, to honor us, our friends and our families. With their help and support we have committed long hours to the study of medicine; they have enabled us to overcome the obstacles of frustration and self-doubt, and to experience the joy of discovery and growth. Our families give us the gift of the realization that we too can make a difference. While celebrating our accomplishments, let us celebrate and thank our parents, our teachers and our mentors; today represents an affirmation of what they have recognized and nurtured in us for many years.

Congratulations, friends. What a joyous and challenging experience it has been to share with you!

**2002 Commencement Speaker
Professor Irv Weissman**

It is a great pleasure to introduce Irv Weissman, the Karel and Avice Beekhuis Professor of Cancer Biology, Pathology, Developmental Biology and, by Courtesy, Biological Sciences, as our 2002 Commencement Speaker.

Professor Weissman has been deeply interested in science, medicine and research since he was a high school student in Great Falls, Montana. Although he never forgot his Montana roots, he has also become a deeply committed member of the Stanford community for over four decades. He arrived at Stanford in 1960, just one year after the School of Medicine moved from San Francisco to the Palo Alto Campus. This was a time of great excitement at Stanford Medical School, with new opportunities to align science and medicine through what was then known as the Five Year Plan. His education at Stanford Medical School shaped his career and empowered him to change the face of modern medicine.

Professor Weissman has had an extraordinarily distinguished career as a scientist, entrepreneur and advocate. These intersecting activities share a common thread: the quest for human stem cells both as a means to elucidate fundamental mechanisms of health and disease and, of course, as potential therapeutic tools to treat or prevent human ailments. As often happens, the quest began many years ago with fundamental questions, in this case the progenitor origin of human lymphocytes. This led to the discovery by Professor Weissman of the first human hematopoietic stem cells a decade ago. The dividend of his research is the new field of human stem cell biology. The fruits of his efforts now intersect biology, medicine, ethics, religion and politics in some ways reminiscent of the struggle surrounding Copernicus and Galileo.

Professor Weissman's research has been deeply respected and valued. He has won numerous accolades and awards including election to the National Academy of Sciences and just last month, he was named the California Scientist of the Year. In addition to his published research, he has founded three companies, lead numerous national advisory groups including most recently, the National Academy's Committee on Cloning, and has become a public spokesperson on stem cells and cloning. He is a world-renowned leader and advocate who is helping to shape both the science and public policies regarding stem cells and medicine. It is a great pleasure to welcome Professor Irv Weissman as our 2002 Commencement Speaker.

LESSONS FROM A STANFORD MEDICAL EDUCATION

Irv Weissman, MD

Thirty seven years ago I sat where you now sit, having just finished a 5 year medical education in lock-step with my classmates. A few months before I had decided to take a less-traveled road I was the only one in my class) and finish my formal clinical training to enter a career of biomedical research. I could not have made that informed choice had I not decided to apply to the new, unique 5 year MD program that Stanford instituted upon its move from San Francisco to join the rest of Stanford University. Stanford was the

only medical school to which I applied, because Stanford was unique in offering a curriculum that allowed students the time and the opportunity to explore all that a great university and medical school have to offer, and therefore to find their special talent. The lessons I picked up on the way, only a few from the formal classes, have stuck with me, as have my associations and collaborations with my Stanford fellow travelers. I loved the clinical years in med school, both for the patient contact, and more importantly, how the desire to treat patients well and rationally forced me to read more deeply, and to try to understand the diseases we were treating largely empirically. But I knew that empiricism would not keep away my growing frustration that we didn't know enough to advance treatments from knowledge of disease mechanisms. So I chose a career in biomedical research, and learned many lessons on the way. I hope today to pass on the lessons I've learned, and how the lessons learned might help you to find or use your talents as well.

I have spent 46 years directly engaged in biomedical research, starting in a small transplantation genetics lab in Great Falls, Montana. I have been an immunologist, and cancer biologist, and for the past 15-20 years a stem cell biologist deeply involved in biomedical science and medical translation. As time has gone by I am increasingly in awe of the complexity and efficiency of nature and of organisms like us. Let me be clear this is no mystical or religious view, but one grounded in the context of the view that the human body is a result of hundreds of millions of years of evolution. While I have heard repeatedly many distinguished scientists, usually near the end of their career, say that we know so much (in 1962, or 1976, or 1990, etc) that all the rest will be only dotting i's or crossing t's. **I couldn't disagree more.** I am firmly of the view that we are just now at the beginning of exploring how the body develops, functions, and what happens when it malfunctions. It is you, not my generation, that will have the greatest opportunity to unlock the great secrets of health, the mind, and disease, and how the body regulates itself, regenerates its components, and simply endures. Imagine, I am a 62 year old man driving a 4 year old car that will be gone before it is 10. And I was one of the first occupants of the Fairchild science building, entering at mid-career, and now I'm told it has reached the end of its useful life and must be torn down and rebuilt; hopefully the leaders who make such decisions won't look too closely at me. I am still amazed that while I go through my 24/7 my body repairs itself continuously (from stem cells!), and while I sleep, my heart keeps beating and I breathe. These phenomena may seem ordinary to you, but they are extraordinary to me. And think of this: I am talking to you, you are listening to me, and all of us understand what was said. No neuroscientist has even the beginnings of an understanding of the complexity of this almost instantaneous set of perceptions, assembly of information, synthesis of assembled information, resultant learning, and the properties of mind that go into these events, much less the memories that will follow. Or to take the example further, one of my first patients in psychiatry as a medical student was to diagnose a patient that was silent and withdrawn. Over a week of meeting it came out he had been hearing voices, and these voices knew him well and tried to direct him. He had finally concluded that the voices came from alien powers, and in that observation departed from the path of understanding the world as most of us do; he became estranged from reality. About 10 years ago I read that perfectly rational patients hearing voices were studied by PET scan technology, and when the voices came on, deep brain centers fired. So incipient schizophrenics hear organized voices from self-

firing foci without input from the ear, and then must deal with the fact that no one else is hearing them. I know a few well who have been made aware that these are like epileptic foci, and live with the voices with a little help from therapies; they live essentially normal lives, although the voices annoy them. These examples might seem far-fetched, especially from a stem cell biologist, but of this I am sure - these phenomena are rational, involving nothing more mystical than cells and molecules and their organization. These mysteries will be susceptible to understanding by biomedical science, and will certainly be useful eventually in medical practice.

What I am saying is that the study of humans in the context of nature is just at the beginning, and that those who will commit to this adventure are coming in at just the right time. But I want to re-frame what I'm saying in the context of a biomedical education, and where you are at the end of one stage of training, on the edge of going from competency to mastery of your subject. I want to step back and say that **collectively our job, our responsibility, is to end the tragedies of premature incapacity, premature morbidity, and premature death of our current and future patients.**

Some of you will do so by gaining mastery in some field of biomedical science, others by translating discoveries and principles (medical, scientific, economic, etc.) to advancing medical practice, and still others by incorporating these translations into what you have learned and will continue to learn into direct medical practice, hopefully as a lifelong exercise. But you need to know what you are up against. In my view, nature and disease are relentless forces that operate independent of what we think or hope. In order to be effective in understanding nature and overcoming diseases, we must go forward with the knowledge and principles you are now adopting and will amplify. There is no room in this venture for self-deception or self-interest; neither can influence what is true. Our observations must become increasingly more accurate, and we have to temper our enthusiasm over our nascent discoveries and insights with an acquired habit of self-criticism. Although money, fame, and/or patient adulation can be motivators, they are not helpful, as they have historically, and will in the future simply serve to divert you from what you are best at doing. Finding your talent and practicing it will keep you engaged, and usually other desired rewards follow anyway.

At least since Stanford moved from San Francisco to Palo Alto it has committed itself to provide a unique graduate medical education and opportunity. We have sought to be a leader in advancing medical sciences, in providing a scholarly approach to all we do, in providing for our patients the highest standard of medical care, and in attempting to be leaders in the translation of medical discoveries. With your class, as with others, we **intended** to admit those who by their actions before medical school had demonstrated concretely that they possessed the capabilities and motivation to take advantage of these goals. After you came here, we intended to provide for you the education, and independently the opportunities to do all of these. If jointly we have been successful, you will have taken advantage of your opportunities, and you will also recognize the equivalent values of 1) the role of science and scholarly inquiry in advancing medical knowledge and practice, 2) the role of medicine in revealing the reality of human disease as well as treating it, and 3) the role of translational medicine in moving discoveries from the bench to the patient. Hopefully you will have chosen role models that exemplify these

values and practices. I certainly did. I think you will find that these role models got where they did by a combination of traits we all should recognize: commitment, responsibility, integrity, and idealism.

You who are about to be MD's are about to take an oath that has its roots in the Hippocratic Oath, taken by physicians for centuries. Like you, I took a similar oath. I am constantly reminded of the wisdom of that oath, and how it has guided much of my own career. It is important that you realize that this is a **commitment**, a commitment of physicians that the care of their patients is their **first consideration**. For those of us who are physician-scientists, I would say that this is a commitment to the health of the patients who could benefit from the translation of our findings. When I think of this commitment, I don't have to go far. Today you are honoring Stan Schrier, who is my role model for commitment; nothing else ever comes first for Stan. He was a legend when I entered medical school, and he is a legend today. And Harry Oberhelman, who in his late 70's (I think) outperforms and outlasts faculty and residents a fraction of his age. And of course there are many others on our faculty.

This year I reread the oath (The Stanford Affirmation) when I needed guidance on a difficult issue. I was chairman of the panel of the National Academies on Human Reproductive Cloning, and the related subject of Nuclear Transplantation to produce human embryonic stem cells for research and therapy. My panel had determined that reproductive cloning was dangerous medically, poorly feasible scientifically, and in terms of the human participants in the exercise the cloned fetus and the mother that carries it carried the almost certain probability of fetal death and maternal morbidity. In fact any such research violates several specified recommendations of the Nuremberg Code, articulated in 1947 by the US Military Tribunal Number 1 at the Doctor's Trial, which, by the way, I believe should be required reading for all medical graduates. The Panel considered also the production of embryonic stem cells by nuclear transplantation, a procedure wherein the nucleus of a somatic cell is transplanted into the enucleated egg from a pre-defined donor, the diploid cell is then electrically stimulated, and allowed to progress to the preimplantation blastocyst, a stage of development of about 150 cells. The inner cells can then be cultured to produce pluripotent stem cell lines, cells which at the single cell level can either self-renew and expand their numbers, or be caused to differentiate to daughter cells that represent all cell types in the body, albeit arranged in a disorganized fashion. These daughter cells can be transferred to newborn immunodeficient mice, and there they undergo normal differentiation specified by their own genes and stage of commitment, and the adequacy of the environment into which they are placed. Thus, for the first time, if this were allowed with human tissue sources, one could prepare pluripotent cell lines representing each genetically determined human disease, which is most diseases, and even from each cancer, which has undergone its own life history of somatic mutations that specified cancer development. While such a procedure is abhorrent to some for moral, ethical, or religious reasons, it had to be recognized that it could lead to breakthroughs that will change biomedical science and medicine itself, much like the recombinant DNA revolution in the 70's (begun at Stanford by Paul Berg and Stan Cohen) led to technology and therapies that save tens of thousands of lives today. This was recognized by my panel, and we voted unanimously

that the promise of such research was so great, and the risk to human participants (egg donors) so minimal, that such research should go forward. But when I testified before the Senate, and before the President's Council on Bioethics I realized that several MD's were the advocates of a complete ban on such research. Further, the Brownback and Weldon bills that ban such research also propose penalties including up to 10 years in jail and a 1 million dollar fine for any physician who would prescribe for a patient a remedy coming from anywhere in the world that is derived from nuclear transplantation embryonic stem cell lines. In today's Stanford Affirmation you will take the oath that you "will treat any who need my ministrations, without regard to religion, nationality, race, politics, sexual orientation, or social standing." When I sought guidance from that oath, I interpreted that to mean that as an MD biomedical researcher, I must leave at the door my own personal politics, religion, ethics, etc, so that meaningful research and therapies can be generated. In my view, therefore, either as a physician or a physician-scientist, the passage of these bills would require us to fail to honor our oaths, as there will be a time when you will have to deny current and future patients therapies that could have been in our grasp.

After commitment comes **responsibility**. When you develop a new finding or insight, you can let others know and act on it or not, or you can take the view that you are responsible for taking it as far as it can go. Here we have several role models. One of mine was my mentor, Henry Kaplan, who not only showed experimentally that radiation had the possibility to treat cancers, but took the responsibility with Stanford physicists like Ed Ginzton to help develop high energy linear accelerators that could deliver their ionizing radiation in the tumor, and not the skin. With colleagues that included Saul Rosenberg, Henry developed the therapy model which in their clinical trials changed Hodgkin's Disease from an universally lethal to a readily curable disease. It took amazing insight and courage to carry this all the way from discovery research to clinical therapies, and established radiation oncology as a mode for therapies with curative intent that is now world-wide, and for several kinds of cancers. I could have cited Norman Shumway for developing through research the practice of heart transplantation, or Paul Berg and Stan Cohen who not only pioneered the recombinant DNA revolution, but helped to establish biotechnology companies that translated these discoveries. And they and other molecular biologists had the integrity to question the safety of what they were doing in the lab to call for a moratorium on doing their research until it could be shown to be safe for those who made recombinant microorganisms. In all of these cases the insights, courage, and responsible action of these investigators led to medical practices, not previously possible, that now saves tens of thousands of patients each year.

It is important to re-state the issue of integrity. In addition to finding your talent, you have to develop core values of honesty and integrity, so that you have a center that will hold when all else seem to be flying away. Make no mistake that when you have assumed responsibility (with little or no oversight) your integrity will be tested, and usually when you are unprepared. This happens in the science that goes on in your own labs, with the patients you treat, in the companies you advise or establish to translate your discoveries, and in the quest for fame and prizes. There is no doubt that there will be times when you make mistakes, or discover them. It is then that you should remember your oaths and your standards.

Finally, I want to preach idealism. It is too easy to give way to cynicism, or to pursue objectives that promise rewards for you at the cost of your commitment to patients. We are now in a crisis in medical care in both academia and the private sector, where managers, administrators, legislators, and clerks who have not taken the oaths you have taken look to medicine as something other than a right of all citizens. It will take courage, commitment, integrity, and idealism if we are to carry the lessons learned here into careers in medicine and the biomedical sciences. There is one way to counter cynicism, or boredom, or acquiescence to the will of the managers. Find your talent, and practice it for life. You will be happier, and society will benefit.

Special Newsletter Announcement

During the summer months the Dean's Newsletter will depart from its every other week schedule to a more irregular reporting schedule. Regular biweekly issues will resume after Labor Day.

Dean's Newsletter July 2, 2002

Refocusing the Position of Senior Associate Dean for Research, Graduate Education and Postdoctoral Scholar Affairs

In assembling the School's mission-focused Senior Associate Dean positions since my arrival, one of my major criteria was to recruit outstanding individuals who were committed to the School and University and who were poised to impact one or more of our missions, but who also remained anchored as active Medical School Faculty members. I felt the latter was particularly important in order for these leaders to sustain their direct contact with faculty and students and thus "remain in touch" with the life and culture of the School.

Accordingly, I elected to select individuals who would carry out their respective Senior Associate Dean duties on a part-time basis, with the remainder of their efforts occurring in their home department where they could conduct their primary work in research, clinical care, etc. In doing so, I have been enormously fortunate to bring together a wonderful group of leaders serving as Senior Associate Deans for Medical Student Education and Affairs (Julie Parsonnet, M.D.), Research, Graduate Education and Postdoctoral Scholar Affairs (James Nelson, Ph.D.), Academic Affairs (David Stevenson, M.D.), Clinical Affairs (Norm Rizk, M.D. and Ken Cox, M.D. [for Obstetrics and Pediatrics]), Information Technology and Resources (Henry Lowe, M.D.), and Finance and Administration (Mike Hindery).

Each of these individuals has played a critically important role in helping to shape the School of Medicine Strategic Plan and all will continue to contribute to its

implementation in the years ahead. At the same time, the scope of their work has changed and will continue to change as the demands of their various jobs and positions evolve over time. One such change will impact the position of Senior Associate Dean for Research, Graduate Student and Postdoctoral Scholar Affairs. This was a new position that combined both research and education and there is no doubt in my mind that the ideal individual to carry out these wide-ranging activities has been James Nelson, the Rudy J. and Daphene Donohue Munzer Professor and former Chair of the Department of Molecular and Cellular Physiology. As evidenced from the significant progress made to date, Dr. Nelson has done an outstanding job in moving forward a plethora of important initiatives. At the same time, he has found it increasingly difficult to sustain his active research laboratory as well as all the rest of his responsibilities. Indeed, it is now apparent that the range of responsibilities he was asked to perform as Senior Associate Dean is truly more of a full-time than part-time effort. Accordingly, we have agreed that Dr. Nelson will refocus his efforts on Graduate Education and Postdoctoral Scholar Affairs so that he will have the time to carry out his important research program and continue to be a highly valued teacher. This will also enable Dr. Nelson to remain an active member of the Senior Associate Deans group – which is important to me as well as to the future initiatives of the School. Dr. Nelson has been an outstanding leader and colleague and I am deeply appreciative of all the time and effort he has dedicated in helping the faculty, students, postdoctoral scholars and me achieve very important goals that will serve us well for years to come. It is also important to note that the plans Dr. Nelson has initiated concerning research space and planning will be implemented, although on a slightly delayed schedule.

This decision means that the responsibilities for research space and planning previously associated with Dr. Nelson's position will also be redefined. I am currently evaluating several models and am interested in any suggestions and feedback you would like to provide.

Again, I want to thank Dr. Nelson for his many important contributions and I look forward to continuing to work closely with him as Senior Associate Dean for Graduate Education and Postdoctoral Scholar Affairs.

The Dean's Letter

In recent weeks there has been a considerable stir among medical students regarding the Dean's Letter. The Dean's Letter, which is supposed to represent the School's official assessment of medical students applying for internships, has been poorly received by numerous residency programs throughout the country. We have proposed returning the style to that used prior to 1996. This realignment is meant to respond to two perceived threats: 1) increasing demands from the AAMC (American Association of Medical Colleges) to provide rankings and quantitative information about our students in the "Medical Student Letter of Evaluation" – demands that we do not intend to follow since they are not consistent with our program at Stanford, and 2) comments from numerous residency directors that our students' strengths cannot be adequately determined by the

current letter and that the students' chances of ranking are thereby harmed – these comments clearly raise considerable concern.

The School has a responsibility to support and value its students throughout their education and to create an environment that prepares them as best as possible for challenging and exciting careers in medicine and science. Stanford is one of a handful of schools that does not have a grading system for its medical students, largely in order to sustain an environment that fosters opportunities for students to explore areas of knowledge in a non-competitive manner. This is highly valued by Stanford students and the current Administration has no intention of changing this policy. However, a number of students appear to view a return of the Dean's Letter to its past form as a move toward a formal grading system. That is simply not the case. We have no plans to institute a grading system for medical students.

At the same time, we have an institutional responsibility and obligation to assure that our students are accurately, fairly, and equitably represented in the Dean's Letter with the obvious goal of helping them to be admitted to the very best residency program possible. Doing that means that we must provide the School's objective evaluation of a student's performance, especially in their clinical rotations.

While I understand the concerns about competitive environments, and absolutely would not want to see one develop at Stanford, I do not understand how an objective process of assessment and evaluation can be viewed as negative in relation to one's performance in clinical care. The goal of every student, just like every physician, should be to carry out her or his clinical care responsibilities in the very best manner possible. The "competition" in clinical care is really with oneself – to do the very best possible to care for one's patients. Naturally, one's individual performance will be further guided by one's interests and abilities in various areas of medicine. It is erroneous to think that we all have the same skills in every area and facet of medicine – or the same level of interest.

Residency program directors and internship selection committees are interested in how the student has performed and they look to the Dean's Letter along with letters of recommendation, USMLE scores and other metrics to determine whether a student will be selected to a specific program. My experience prior to coming to Stanford was with a program that received more than 2000 applications for 25 internship positions. The lack of an objective or thoughtful Dean's Letter weakened the student's application – as I felt was true for letters coming from Stanford during the past several years. That experience has been recapitulated from numerous other residency programs as I have heard from colleagues around the country.

I understand that change can raise concerns and can sometimes feel threatening. The goal of the Dean's Office has been to be fair and balanced both for the integrity of the student and the School. However, I hasten to add that the very negative characterization of individuals within the Dean's Office who have the responsibility to bring forth these changes has been most disturbing and unfair. Indeed, a number of the emails and other communications I have seen from students addressing this topic have been disparaging

and rude as well as incorrect. I have every expectation that our students should feel free to express their concerns and viewpoints. We welcome those. At the same time, I also have every expectation that this will be done in an open, honest and respectful manner. Respectful communications, whether by email or in person, are an important aspect of professionalism and are no different than respect for human rights and freedoms of choice. In the end we have the same goals and those are not served when strident language creates barriers or unnecessary lines in the sand. Mutual respect and professionalism should guide our behavior, even when there might be differences of opinion.

LCME Approves the School's Short and Long Term Facility Plans and Restores Regular Accreditation Cycle Reviews

On June 10th we received official approval of the School's short and long-term facility plans, and have now been restored to a regular eight-year accreditation review cycle. This is excellent news and deserves some background as well as an update on our current and future plans.

Some readers will remember the GALE project, which was designed to address deficits in the School's education and library facilities. These deficits were quite serious, and actually threatened our accreditation by the Liaison Committee on Medical Education (LCME) of the Accreditation Council on Graduate Medical Education (ACGME). The GALE project called for renovations in the Grant, Always, Lane and Edwards buildings within the so-called Stone complex. These are the original School of Medicine buildings that date back to the time that the School moved from San Francisco to the Palo Alto campus. Because these buildings are now more than four decades old, renovations are needed to address infrastructure improvements to make them more earthquake safe. Because of the physical constraints and huge expense associated with such a major, large-scale renovation project, and owing to the limitations on building and land-use on the Stanford campus, the ability to meet the forecasted needs for education and library facilities, as well as for research and administrative space, was deemed difficult and perhaps impossible. Compounding the issues surrounding GALE was the fact that many of the physical renovations were not based on a clear understanding of the goals and requirements for the future medical and graduate student education programs, nor had the scope and requirements of a library for the 21st Century been defined. Coupled with this was the fact that the projected renovation costs exceeded \$185 million, nearly all of which would have had to come from philanthropic support – at the very time when fundraising had been adversely impacted by the local and global economy.

Accordingly, I recommended the cancellation of the GALE project in February 2001. Soon afterward I sought permission from the LCME to pursue an alternate plan, based on a more robust definition of our strategic initiatives for education and research, and ideally based on new rather than renovated facilities. At the same time, attention to existing facility improvements became critical since new facilities would take some years to complete. The compilation of these short, intermediate and long term objectives, based

on our programmatic planning, was submitted to the LCME in early May of this year, and was reviewed and approved at the June 5-6th LCME Board meeting.

Although I have covered some of these issues in recent Newsletters, I want to restate the changes that will be taking place. It is also important to note that these plans emanate from our Strategic Planning Process and were discussed at the Retreat on February 8-10th. They were also presented to the Medical School Faculty Senate on May 15th and to the Board of Trustees Committee on the Medical Center on June 13th. The plans for our new facilities will be presented to the University Board of Trustees Committee on Land and Buildings in the Fall and then more formally to the Board in 2003. Raising the funds to support the construction of our new Stanford Medicine Information and Learning Environment (SMILE) will be the number one priority for the Campaign for Stanford Medicine, which will be formally launched at the beginning of 2003. It is important to note that most of our Strategic Plan initiatives are related to this important effort.

Following are the short and intermediate plans we are taking to improve current facilities until the new SMILE project is launched and completed.

Completed, In-Progress and Planned (through Fall of 2003)

1. Education Facilities
 - a. Eight seminar rooms, bio-skills lab and dissection labs have been developed in the CCSR building. Some of these rooms serve as both classrooms and small group study areas. The rooms include state-of-the-art AV technology.
 - b. M-Wing classrooms will be renovated in two phases. The first phase will include refurbishing or replacing the seating, as well as painting and carpeting the lecture halls. The second phase (scheduled for next summer) will include installation of new ceilings, lighting, and infrastructure to support state-of-the-art AV.
 - c. The Fleishmann Teaching Labs will be renovated.
2. Student Life
 - a. The medical student lounge and restrooms are being renovated and the restrooms on both the first and second floors are being upgraded.
 - b. The Admissions Office and Center of Excellence being relocated to space contiguous with the Office of Student Affairs.
 - c. The Fairchild Student Lounge will be renovated and several computer workstations will be installed.
3. Library
 - a. A cooling system has been installed.
 - b. Off-site space has been renovated to house seldom used collections.
 - c. A site for 24-hour small group study rooms will be completed.
 - d. 1000 nsf of existing carrel space will be replaced with a reading room equipped with comfortable seating and wireless and wired network connections.

Some of these interim solutions have been completed, others are in progress and some are to be finished during this summer and next. In the aggregate they represent a significant

commitment to our students and educational programs. Although we will be constructing new education facilities in the long run, these renovations are still quite costly and will exceed \$16 million. Nonetheless, we wish to do all that we can to provide as valuable a learning environment as we can for our students.

As noted above, active planning for the new education and library facilities (SMILE Project) has now been initiated. An Executive Steering Committee has been formed, which I will chair, and this committee will define the scope, program and conceptual plan for the new facilities. We are expecting to present these plans to the Executive Committee before we present to the Board of Trustees later this fall. Again, the SMILE project will be our highest priority as we initiate the Campaign for Stanford Medicine next year. Even under ideal circumstances, however, the final completion of SMILE is not likely before 2007-2008.

Update on Strategic Planning

Work on various aspects of the Strategic Plan continues. During the past few weeks several groups have been assembled to carry out key components of the plan and these are listed below.

Medical Student Education: You may recall that committees are being assembled to address curriculum reform: one to address the essential knowledge base for medical students, another to address the formation of the new Scholarly Tracks. This latter committee has now been assembled and held its first meeting on June 17th. The members of this committee include:

Gary Schoolnik (Chair) - Medicine/Infectious Diseases

Rosalinda Alverado - Medical Student

Minx Fuller - Developmental Biology

Brian Hoffman - Medicine/Endocrinology

Emmet Keeffe - Medicine/GI

Ted Leng - Medical Student

Yvonne (Bonnie) Maldonado - Pediatrics

Doug Owens - Medicine/GIM

Audrey Shafer - Anesthesiology

Tim Stanton - PriSMS

Charlie Taylor - Surgery/Vascular Surgery and Engineering

David O'Brien (Staff) - Institutional Planning

1. **Academic Affairs:** As noted in the June 10th Newsletter, considerable effort is underway in reviewing and revising the academic appointments and promotions process within the School of Medicine and in relation to the University. We are actively working on the criteria that will define an Investigator Track (currently UTL), Clinical Investigator (currently MCL), and Clinical-Educator (a new path). In addition, we are further defining the criteria surrounding the Voluntary Clinical Faculty. We reviewed the work of several committees at the School's Executive Committee on June 7th and invited the Provost to attend our Executive Committee meeting on June 21st to further review these plans. Based on the

work-to-date, we anticipate that the next stage of the plan will be announced by the end of Summer or early Fall. A major goal, being lead by Dr. David Stevenson and the faculty working with him, is to better align the functions performed by our faculty and staff physicians with the mission-related functions they perform in basic and/or clinical research, education and clinical care.

2. **Finance and Administration.** As noted in the June 10th Newsletter, we are planning to change the School's Operating Budget for the FY04 fiscal year (which begins September 1, 2003). Among the major drivers for this change is the need to optimize our ability to support the changes in curriculum for medical and graduate education that we envision is critical to the School's future, as well as to support more multidisciplinary interdepartmental research and educational initiatives to promote translational research and medicine. In order to help guide these important changes in the Operating Budget and to determine their impact on departmental resources and planning, and Operating Budget Formula Committee has been established and includes:

Michael Hindery (Chair) - Finance and Administration

Eleanor Antonakos - Office of Student Affairs
John Boothroyd - Microbiology and Immunology
Brian David - Surgery
Garry Fathman - Medicine/Immunology
James Nelson - Graduate Education and Postdoctoral Training and Molecular & Cellular Physiology
Julie Parsonnet - Medical Education and Medicine/Infectious Diseases
Robert Robbins - Cardiothoracic Surgery
Judy Swain - Medicine
Carole Buffum (Staff) - Finance and Administration
Perry Everett (Staff) - Finance and Administration

3. **Information Resources and Technology.** Because the position of Senior Associate Dean for Information Resources and Technology was filled after the February Strategic Planning Retreat, this important area is moving on a different time-line. Nonetheless, important and considerable progress has been made and the strategic plans for this important areas will be more fully developed by Fall to early Winter. To help guide this, an Information Resources and Technology Steering Committee has been assembled and held its first meeting on June 24th. The Committee includes:

Henry Lowe (Chair) - IRT and Medicine/GIM

Carole Buffum - Finance and Administration
Parvati Dev - IRT/Instructional Technologies
Jin Hahn - Neurology and Neurological Sciences
Rob Krochak - Pathology
Michael Levitt - Structural Biology
Don Regula - Pathology
Valerie Su - IRT/Lane Library

Gerry Wietz - IRT/MedIT
David O'Brien (Staff) - Institutional Planning

Updates on the progress of these committees, as well as the many other initiatives underway, will be reported in subsequent Newsletters.

Hospital Update: Changes at Stanford Hospital and Clinics

On June 18th Ms. Martha Marsh, President and CEO of Stanford Hospital & Clinics, announced a series of changes in the organizational staffing and structure of her leadership team. While changes impact people as well as programs, it is important to underscore that the goal is to improve the overall quality of patient care and the financial performance of SHC. Compared to a year ago, significant progress has been made in the financial performance of SHC and it is now projected that the FY02 budget may achieve a breakeven performance. While this is encouraging, there remains an enormous amount of work to be done in order to make SHC as successful as it must be in these very challenging times in American healthcare. While I am certainly cognizant of the many feelings that arise at times of change, particularly at high levels of an organization, it is imperative that the School and faculty be as supportive as possible during this transitional period. The success of our Medical Center depends on the cooperative interactions among members of the School, SHC and LPCH.

Stanford and Global Medicine

The work of Stanford Medical School faculty and students extends well beyond the borders of our Palo Alto campus. Some of this is the direct result of basic and clinical research performed at Stanford while other work relates to various travel programs, collaborations and activities that occur throughout the world. Exchanges of faculty and students also play an important role. One of our goals over the next year will be to better coordinate these activities and opportunities.

Among the relationships that Stanford currently enjoys is a Memorandum of Understanding with Shantou University School of Medicine in South China that identifies several key areas for collaboration, including: Cardiovascular Medicine, Imaging, Liver Cancer and Prevention and Treatment of Liver Disease, Medical Education, Neurosurgery and Pediatrics.

Shantou University is a new school, developed 20 years ago through the extraordinary philanthropic support of Mr. Li Ka-shing. The University has programs in medicine, science, arts & humanities, journalism, business and law. During a short period it has risen rapidly to become one of the leading universities in China and its medical center is assuming equal prominence.

On June 27-28th I visited Shantou University along with Dr. Alan Yueng, Associate Professor of Medicine (Cardiovascular) at Stanford and also a Member of the Board of Trustees at Shantou University, as well as with Ms Jackie Brown, Director of the Office of Medical Development. We had the opportunity to attend commencement exercises and I delivered an address to students and faculty on the opportunities and challenges for global collaboration in research, education and clinical care. There is considerable interest by students, faculty and university leaders to have a closer collaboration with Stanford and over the next months we will further develop our plans for interaction and determine opportunities that may be of interest to our students and faculty.

Children's Health Fair

Stanford University Medical Center physicians and students, along with community volunteers, sponsored a Children's Health Fair for underprivileged children on July 15th at the South County Community Clinic. Eighty-three children were evaluated at the Health Fair and sixty-five of these children underwent complete physicals. In addition, fifty-one children were immunized, twenty-three children were signed up for free dental exams and cleanings, and dozens were enrolled in either MediCal or Healthy Families Health Plans. These services could not have been offered without the dedication of all of the volunteers.

Due to the success of this program, another Health Fair has been scheduled for Saturday, August 24th, at the same location. If you would like to volunteer or receive more information regarding the Children's Health Fair, please contact Natalie Pageler (npageler@Stanford.EDU) or Monica Eneriz (meneriz@stanford.edu). The following URL has a copy of the proposal that has more explicit information about the goals and services of the Children's Health Fairs **Kevin will provide**

Congratulations

Dr. Linda Cork has informed me that Dr. Glen Otto and Mr. Reese Zasio have received awards of excellence from Environmental Health Health and Safety. Congratulations to both Dr. Otto and Mr. Zasio

Appointments and Promotions

Frank Arko has been appointed to Assistant Professor of Surgery (Vascular Surgery) at the Stanford University Medical Center, effective 7/1/2002 to 6/30/2005.

Bruce Buckingham has been appointed Associate Professor of Pediatrics at Santa Clara Valley Medical Center, effective 7/1/02 – 6/30/07.

Lawrence Chow has been appointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective, 7/1/2002 to 6/30/2005.

Tina Cowan has been appointed Associate Professor of Pathology and of Pediatrics at Stanford University Medical Center, effective 7/1/02 – 6/30/07.

Ramona Doyle has been promoted to Associate Professor of Medicine (Pulmonary and Critical Care Medicine) and, by courtesy, of Pediatrics at the Stanford University Medical Center, effective 8/1/2002 to 7/31/2007.

David Liang has been reappointed to Assistant Professor of Medicine (Cardiovascular Medicine) and, by courtesy, of Electrical Engineering at the Stanford University Medical Center, effective 7/1/2002 to 6/30/2006

Timothy McAdams has been appointed to Assistant Professor of Orthopedic Surgery at the Stanford University Medical Center, effective 7/1/2002 to 6/30/2005.

Cornelius Olcott has been reappointed Professor of Surgery at Stanford University Medical Center, effective 7/1/02.

Marlene Rabinoviyh has been appointed to Professor of Pediatrics and, by courtesy, of Developmental Biology, effective 7/1/2002.

Craig Rosen, has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Palo Alto Veterans Affairs Health Care System, effective 7/1/2002 to 6/30/2005.

Eric Sibley has been reappointed to Assistant Professor of Pediatrics, effective 7/1/2002 to 12/31/2005.

Jane C.Tan has been appointed to Assistant Professor of Medicine (Nephrology) at the Stanford University Medical Center, effective 7/1/2002 to 6/30/2005.

Congratulations to all.

Dean's Newsletter

July 29, 2002

Bioengineering Department: Searching for Initial Chair

As I hope you know by now, on June 14th the Board of Trustees approved the creation of a new joint Department of Bioengineering by the Schools of Engineering and Medicine. This will be the first joint department at Stanford and one of very few joint departments

of bioengineering in the country. Board approval offers an enormously exciting opportunity for this important new department and for the University.

The Deans of Engineering (Dr. Jim Plummer) and Medicine (Dr. Phil Pizzo) regard the leadership of the new department of Bioengineering as critical to its success and are thus committed to a full national search for senior individuals who can provide this leadership. However, because of the desire to move forward with the new department as rapidly as possible, the Deans believe it is appropriate to appoint an initial set of leaders for this department from a pool of internal candidates. The initial leaders chosen for this department, and other internal candidates, can certainly be candidates in the broader national search process that will soon follow. Accordingly, the Deans have appointed a Search Committee co-chaired by Drs. Judy Swain (Medicine) and Curt Frank (Chemical Engineering), along with Drs. Eric Roberts (Computer Science), Norbert Pelc (Radiology) and Charles Taylor (Surgery & Mechanical Engineering). **If you are interested in being considered for the Initial Chair position in the Department of Bioengineering or would like to recommend someone for this important position, please contact a member of the Search Committee.**

Qualifications for the Initial Bioengineering Department Chair

Faculty member at Stanford University

Full Professors preferred

Excellent understanding of the existing programs in the University that could contribute to the success of the new department

Demonstrated leadership

Responsibilities of the Initial Bioengineering Department Chair

- Participate with the SOE and SOM Deans in selecting the Associate Chair who, together with the Chair, will provide the initial leadership team.
- Lead the effort to define initial faculty searches to recruit new faculty to this department
- Recommend an administrative structure for the department and hire initial staff
- Work with other department chairs in the schools of Engineering, Medicine, H&S and Earth Sciences, and with Bioengineering faculty, in the selection and recruitment of current Stanford faculty for full time, joint, and courtesy appointments in the new department
- Work with faculty and advisory groups to refine the department's academic scope, research focus, and educational programs
- Work with the Deans of Engineering and Medicine to develop the department's yearly budget
- Work with the Deans to develop a funds flow process to build and sustain the new department
- Lead the effort to gain approval of the department's graduate degree programs
- Determine the appropriate time to initiate an undergraduate curriculum, and lead the effort to gain approval for this education program

- Develop a plan for fundraising for Bioengineering programs
- Work with the Deans to identify the short term and long term space and facilities necessary for the department's research and educational programs
- Work with the Deans and the leadership of BioX to develop interdisciplinary programs, to coordinate fund raising, and to optimally utilize Bioengineering space in the Clark Center

Again, if you are interested in this position, or wish to recommend someone for it, please contact a member of the Search Committee (Drs. Judy Swain, Curt Frank, Eric Roberts, Norbert Pelc, Charles Taylor). Importantly, please do this as soon as possible since the Search Committee will be working on this during August.

House of Stone: An Important Student-Initiated Project

On August 1st the student-initiated ***House of Stone*** exhibit will begin at the Mountain View City Hall Rotunda at 500 Castro Street. Established by three Stanford Medical Students, Susanne Martin Herz, Elizabeth Rogers and Jeannie Chang (a recent graduate), the ***House of Stone*** imports Zimbabwean Shona stone sculpture and auctions it in the United States and in Germany. ***All proceeds from the sales go to support HIV-infected children in Zimbabwe.***

I encourage you to visit the House of Stone website at www.houseofstone.org. In addition to the exhibit and auction in Mountain View beginning August 1st, remaining art will be auctioned at the Lucille Stern Community Center in Palo Alto on August 25th.

I hope you will help support this important student initiative.

Budgets and Performance Evaluations

Although summer tends to be a quieter time for most of the University, it is a very busy time at the School of Medicine and Medical Center. This is the time we review and finalize our budgets for the new fiscal year that begins on September 1st. Developing a consolidated budget that includes all sources of funding and expense for basic and clinical science departments, as well as all of the School's administrative units, along with faculty and staff salary setting and performance evaluations of department chairs and other School leaders, is critically important, timely and time-consuming. I want to thank the incredible work of Mike Hindery, Carole Buffum, Perry Everett, Cori Bossenberry and their respective staffs, as well as the Department Chairs and their DFAs, for diligent and exceptional work.

As I have described in other communications, these are challenging financial times for academic medical centers. While the School of Medicine benefits from a significant endowment, its resources are limited and insufficient to fund all of the important projects and initiatives that might ideally be supported. Indeed, financial projections for the next several years make even clearer that strategic investments will need to be highly

prioritized, underscoring the importance of careful strategic and programmatic planning. Equally importantly, we will need to critically examine the cost-structure within the School and address ways of streamlining or eliminating various activities so that our highest priorities can be achieved. Naturally, we will also need to seek ways to bring additional resources into the School to support critical missions. This will be the focus of our Campaign for Stanford Medicine that we plan to initiate in calendar year 2003 (see below).

Mini-Retreat on Clinical Organization

On Friday, July 26th, a Mini-Retreat was held with Clinical Department Chairs to review the current and future organization of the faculty clinical practice. During the past decade there have been numerous changes at Stanford in Medical Center governance and faculty practice organizations. This has included the migration of the separate Stanford Faculty Practice Plan to the current integrated practice within the Stanford Hospital System (SHS) organizational structure. Additional changes have included the attempted merger of the clinical practice with UCSF and the subsequent dissolution in 2000. In addition, the two hospitals, Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH), have gone from separate to consolidated and back to separate organizations; both are currently incorporated under the University and governed by separate Boards of Directors.

In addition to these changes in Medical Center organization, changes in leadership have also occurred, both in roles and in the individuals filling these roles. A year ago the Medical Center was governed by a Vice President for Medical Affairs. However, with the dissolution of that job the governance of the Medical Center is now more of a confederation model, led by the Dean of the School of Medicine and the CEOs of SHC and LPCH. Moreover, of these three leaders, two (Phil Pizzo, Dean, and Martha Marsh, CEO of SHC) are relatively new. They and Chris Dawes, CEO of LPCH, work collaboratively through the Medical Center Executive Committee.

While the School and Hospitals have separate governance and financial accountability, they are naturally intertwined and interrelated, not only in their missions in clinical care but also in research and education. Indeed, achieving the mission of the School of Medicine requires a close partnership with SHC and LPCH and vice versa. During the last decades numerous governance models have configured academic medical centers across the country, and it is safe to say that no single model has emerged as clearly the most successful. Indeed, as important as the governance model is the local environment, including its financial performance and, perhaps mostly importantly, its leaders. The current revision of the governance structure at Stanford must therefore be viewed as a work-in-progress. The goal, however, must be to assure the success of the medical center as a whole, along with the mission of the School to be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovations in patient care, education and research.

In order to foster the future of the patient care mission, the mini-retreat addressed the range of organizational structures that are used in various academic medical centers around the nation. These range from a faculty practice foundation, that is separately incorporated, to a faculty practice organization (FPO), to a physician-hospital organization (PHO), to no clearly defined model of organization. At this time, we currently fall into the latter category (no clearly defined organizational model) at SHC, whereas LPCH more closely resembles a PHO model.

Among the conclusions that emerged from the Mini-Retreat was the perspective that separate models of organization were both appropriate and necessary at LPCH and SHC in relation to the School and faculty. The plans at LPCH are to move toward an FPO with clearly defined physician/faculty leadership during the next two years. This effort is currently being shepherded by Dr. Ken Cox, Senior Associate Dean for Pediatric and Obstetric Clinical Affairs and Chief Medical Officer at LPCH, in partnership with Chris Dawes, President and CEO of LPCH.

The physician/faculty organization of SHC remains less clearly defined at present and is associated with a more diversified range of opinions and perspectives. Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs, has played a very important role in defining various models and has worked closely with me and with Ms. Martha Marsh, CEO of SHC, on this important issue. Several themes emerged from our review and discussion at the Mini-Retreat on July 26th. The first is the desire for joint governance between the School and faculty with the leadership at SHC. This includes joint responsibility by the Dean and CEO, as well as by chairs and hospital leaders. It was further affirmed that the Chairs, as a group, wish to be engaged in governance rather than through delegation to an “Executive Committee”. Perhaps most importantly, clinical chairs and faculty want to have shared responsibility for key functions essential to their clinical performance and success. These include increased oversight over the professional revenue cycle (e.g., billing, collections, contracting, etc.) as well as operations, especially of the clinics. At the same time, the Chairs and School recognize the needs of the Hospital to achieve its financial and service performance objectives and, accordingly, seek to work cooperatively. The goal is to meet our collective goals as jointly as possible. Clearly the evolution of this organization at SHC is also a work-in-progress and will require further thoughtful discussion between the School and the Hospital during the months ahead.

Strategic Planning Update

Significant progress continues on our School-wide Strategic Planning efforts. We currently anticipate that the overall summary of our Strategic Plan for Stanford Medicine and the accompanying background for the Campaign for Stanford Medicine will be ready for circulation within the School community by late September to early October. We will also post the Plan at that time on our internal Web site and hope that you will offer comments. During the later part of this year we will be recruiting members to the Stanford Medicine Leadership Council and conducting focus group evaluations of the Plan. Based on the feedback we receive, we will plan to begin the silent phase of the

Campaign in 2003. Clearly this and related efforts will be critical to the future of Stanford University's School of Medicine.

Thank You (Again) to Vincent Coates

On July 18th the Vincent Coates Foundation Mass Spectroscopy Laboratory was officially opened in the Keck Science Building. This represents one of a series of significant gifts that Mr. Coates has provided to the School of Medicine and the University. Each has been directed at supporting faculty and important programs and collectively they provide testimony to the impact of a wonderful scientist and philanthropist. I want to express, once again, my deep appreciation to Mr. Coates for his generosity and commitment to scientific excellence and to Stanford.

Congratulations

In the July 2nd edition of the Dean's Newsletter I mentioned that Glen Otto and Reese Zasio were recipients of Directors Awards from the School's Health and Safety Program. I am pleased to announce that Directors Awards have also been presented to **Ms. Jessica Metzger** (Lab Manager, Biochemistry); **Patricia "Trish" McAfee** (LSRA, Radiation Oncology); **Diane Rapacchietta** (LSRA, Radiation Oncology); and **Douglas Menke** (LSRA, Radiation Oncology). Congratulations to all.

Dr. Alan Schatzberg, Professor and Chair of the Department of Psychiatry, has been selected to receive the 2002 Award for Research in Psychiatry from the American Psychiatric Association.

Dr. Eric Knudsen, Professor and Chair of Neurobiology, has been awarded the 25th Annual W. Alden Spence Award by the College of Physicians and Surgeons of Columbia University.

Dr. Bruce Reitz, Professor and Chair of Cardiothoracic Surgery, has been named to receive the 2002 International Recognition Award by the Denton A. Cooley Cardiovascular Surgical Society and the Outstanding Achievement in Medicine Award by the Santa Clara Medical Association.

Congratulations to all.

Appointments and Promotions

Harley McAdams has been appointed to Assistant Professor (Research) of Developmental Biology at the Stanford University Medical Center, effective 8/1/2002 to 7/31/2008.

Salli Tazuke has been appointed to Assistant Professor of Gynecology and Obstetrics at the Stanford University Medical Center, effective 7/1/2002 to 6/30/2005.

Congratulations to all.

Dean's Newsletter

August 19, 2002

Space: A Now and Future Issue

Despite the size of the Stanford campus, land-use is one of the most important issues that the University must grapple with based on the need to balance academic growth within the boundaries of conservation and community needs and expectations. The Medical Center is also space-constrained and must balance the needs of its missions in education, research, patient care and community service. This is made more complex in that the three institutions that comprise the Medical Center, the School of Medicine, Stanford Hospital and Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) each have independent as well as mutual issues and needs regarding the current and future use of space. Further impacting land-use issues in that both SHC and LPCH are entirely within the City of Palo Alto whereas part of the Medical School (i.e., the Stone Complex comprised of Grant, Alway, Lane and Edwards Buildings) is in Palo Alto and the remainder of the School (Fairchild, Beckman, CCSR, MSLS, Lucas, MSOB, CBRL, Redwood, Psychiatry, etc) are on land governed by the General Use Permit (GUP).

Given the needs of the School of Medicine to develop new education and library facilities (aka SMILE Project – or the Stanford Medicine Information and Learning Environment) as its highest priority, along with additional research space and, over time, renovation or elimination of less adequate facilities, a comprehensive planning process is needed. Balanced against this are the requirements for expanded clinical service by both LPCH and SHC. Based on overlapping and, in some cases potentially competing needs, a thoughtful and organized planning process is necessary, both within the Medical Center and in coordination with the University. Accordingly several processes have been put into place during the past several months to address both current and future space needs and requirements that will enable the School to assure its mission as a leading research-intensive School of Medicine that improves health through leadership and collaborative discoveries and innovations in patient care, education and research.

Among the efforts currently underway are the following:

1. **A Medical Center Planning Committee** was appointed by the SUMC Executive Committee to develop a comprehensive space inventory and utilization assessment by the School, SHC and LPCH. This effort is being led by Nancy Tierney, Director of Facilities Planning for SoM and Lou Saksen, Vice President of General Services for SHC and LPCH. This effort is being closely coordinated with the University's Committee on Land and Building Use led by Mr. Bob Reidy, Vice-Provost of Land and Buildings and David Neumann, Associate Vice President, University Architectural & Planning Office. This Committee will complete its overall report by the end of the current year. In the interim, two issues represent important short-term needs. One is the planning for the SMILE Project, which began with a "kickoff" meeting on Wednesday August 7th (see below) and the second is the need to reorganize inpatient facilities within the current footprint at LPCH to create additional intensive care beds and operating rooms through relocation of ambulatory clinics. SHC is also actively assessing its inpatient and ambulatory care facility needs. All of these planning processes are occurring in tandem.
2. **A Long Range School of Medicine Planning Effort** is now being led by Dr. Paul Berg and will present its perspective at the next School of Medicine Strategic Planning Retreat that will be held on January 30, 2003. I have asked Dr. Berg to address the question of whether the School should be considering the need to develop an additional or alternative campus in the decades ahead or whether it should focus on the current Medical Center site and recognize that space limitations will ultimately constrain the prospects for developing new areas of science and inquiry. At the same time, even if the School remains small in comparison to its peers, the contiguity of its basic and clinical science programs to each other and to the hospitals (as a means for facilitating translational research) and to the university (as a route to broader interschool and multidisciplinary research and education) makes the current Medical Center site highly desirable. At the School's Executive Committee on Friday, August 2nd, we introduced this issue as one that will require careful consideration and debate by our Medical School community. Indeed, it is also a question that is important to resolve in the coming year since many of our short and intermediate decisions and priorities will depend on its answer. Clearly this will be a topic that I will bring forward for future discussion in the months ahead.
3. **A Research Space Advisory Committee** has also been appointed based on the changes in the previous role of the Senior Associate Dean for Research, Graduate Education and Postdoctoral Affairs that I outlined in the July 1st Newsletter. Based on these changes, I have appointed a Research Space Advisory Committee to review current and future research space requests and plans, recognizing that the final decisions will rest with the Dean. The Research Space Advisory Committee will include Drs. Steve Galli (Pathology), Alan Krensky (Pediatrics), Michael Levitt (Structural Biology), Suzanne Pfeffer (Biochemistry), Lucy Shapiro (Beckman Center and Developmental Biology) and Judy Swain (Medicine).

At Stanford, space and people are among our most important resources and how they are used will shape the future of the Medical School and the University. Clearly how these issues are addressed will have an important impact on our future and will be topics for future discussion and debate.

SMILE Kickoff Meeting

On Wednesday, August 7th, we held the “kickoff” meeting for the SMILE (Stanford Medicine Learning and Information Environment) Project. Improving Stanford’s facilities for education, learning and information access is my highest personal priority during the next several years. The goal of SMILE will be to create and develop a learning environment that will enable Stanford to teach, enable and empower medical and graduate students as well as residents and postdoctoral fellows, to become future leaders, innovators, discoverers and clinicians at the intersections of science and medicine. . SMILE should also provide a setting that becomes a magnet for faculty and alumni as well as the lay public. SMILE should create a new image and identity for the School of Medicine, which accommodates to the rapid evolution of technology along with a grounding of the fundamentals of humanism and art of medicine. SMILE should also foster the physical setting wherein both the structured and unstructured exchange of knowledge and ideas can be exchanged – within and among students, faculty and scholars. Accordingly, SMILE will house the physical facilities for small group teaching, simulation learning, and the library of the future. To do so, SMILE will need to both respect the past as well embrace the future. Further, SMILE will need to be designed in a manner that is flexible, adaptable and sustainable so that it can adapt to the revolutions in medicine, information technology and patient care that is unfolding and will continue to unfold in the first half of the 21st Century.

To accomplish the goals of SMILE, we have established an Executive Steering Committee that I will chair. This Committee will include Dr. Julie Parsonnet (Senior Associate Dean for Medical Education), Dr. James Nelson (Senior Associate Dean for Graduate Education and Postdoctoral Scholars), Dr. Henry Lowe (Senior Associate Dean for Information Resources and Technology), Mike Hindery (Senior Associate Dean for Finance and Administration), Dr. Oscar Salvatierra (Chair of the Medical School Faculty Senate), Dr. Parvati Dev (Associate Dean for Learning Technologies), David O’Brien (Director of Institutional Planning), Charlie Brown (Director of the Planning Group for the Campaign for Stanford Medicine), Nancy Tierney (Director of the Office of Facilities, Planning and Management), Bev Simmonds (Special Assistant to the Dean), Eleanor Antonakos (Director of Finance and Administration, Office of Student Affairs) and Maggie Saunders (Programmer of Education Facilities). During the next weeks the Steering Committee and Program Committee Chairs will invite students, faculty and staff to participate in five key areas: Instructional and Education Support Facilities, Library and Information Services, IT Communications and Learning Technologies, Student Services, Affairs and Public Education, and the Office of the Dean.

The goal of the SMILE Executive Steering Committee and its related Program Committees will be to further develop the scope and program requirements for the new facilities for education and learning for Stanford Medicine. It is essential that our entire community become engaged and informed about the plans that will be emerging in the next months, both about the site selection for SMILE as well as the scope of the project and the resources that will be necessary to bring it to fruition. I will plan to give regular updates on SMILE in future issues of the Newsletter. We are planning to have a SMILE Website on the Strategic Planning Website that will also enable you to review our progress and offer suggestions. During the Fall we will plan to launch the first of a series of Town Hall Meetings about SMILE to further engage the input of our students, faculty and staff. It is our hope that the progress we make during this period will enable us to seek conceptual approval from the University Trustees in June, 2003.

SMILE will be an ambitious, bold and compelling project that will enable us to transform the future of education and training and that we hope will also serve as a global model for the medical science learning and information center of the 21st Century.

Strategic Planning Process Update

Our Strategic Planning Process is continuing in each of our key mission areas. Several areas of progress during the past weeks include:

- A School of Medicine Community Service Programs Committee (chaired by Fernando Mendoza) was convened in July.æ A faculty community services activities survey will be conducted in August.æ All faculty are strongly encouraged to participate in the survey.
- The proposed Career Center for Graduate Students and Postdoctoral Scholars was approved for support in the FY03 budget.
- A Dean's Advisory Committee on Research Space has been established (see above).
- A clinical chairs "mini-retreat" was held on July 26th to review various clinical practice options (see July 29th Dean's Newsletter).
- Draft A&P criteria for MCL, adjunct, staff physicians, and voluntary faculty were developed and reviewed.
- Government Relations position in Dean's Office approved and posted.
- Department of Medicine and Department of Genetics selected to develop prototype departmental planning processes.
- Associate Director for Graduate Education (Kimberly Griffin) hired to support diversity programs.

Update on Education-Related Renovations

As mentioned in the July 2nd Dean's Newsletter, a number of interim improvements are planned or underway while we await the development of new education facilities through

the SMILE Project (see above). Here is the latest update on the progress made since early July:

Fairchild Lounge Renovation: Renovations and furnishings will be completed by the beginning of September. In addition, during September-October, four computer workstations will be installed in the lounge -- 2 Macs & 2 PC's and a wireless network.

Alway Medical Student Lounge: (and renovation of the first floor Alway restrooms): As of this writing, this project is 80% complete. It is on budget and is expected to be finished by early September.

Alway 230 Small Group Room: The room layout, including new furnishings (movable table and chairs), carpet and technology, has been agreed to by Lane Library, FLRC staff and students. An experimental writing/projection surface will be installed in place of a projection screen and will be installed in September with the remainder of the AV technology. Three of the VCR's will be retained in the space.

Lane Library Informal Reading Room: Further work is underway to finalize the program goals needed to optimize both a quiet reading room and carrel space. Details will follow as they are completed.

M-Wing Classroom Projects: Phase I to rebuild and reupholster the fixed seats in M104, M106, M108 and M114, maintain and clean the seats in M110 and M112, replace the acoustic panels in the rear of M104, M106 and M114, paint and replace bad lamps in the light fixtures began Saturday, August 10th. All work will be completed prior to orientation on September 9th.

Phase II which is intended to be completed by September 2003 has been divided into several scope alternatives. Possible scopes for this project include: creating a case style lecture room in M110 and M112; replacing the ceilings -- acoustic structures, lighting, technology and electrical infrastructure in M104 and M106; in addition to replacing the ceilings in M104 and M106 possible installation of a low raised floor in the front of the lecture halls to facilitate technology and electrical infrastructure is being investigated.

Fleischman Lab Project: The Lab project is expected to take place Summer 2003.

Council of Clinical Chairs Established

On August 8th, Martha Marsh, CEO and President of Stanford Hospital & Clinics and Phil Pizzo, Dean of the Stanford University School of Medicine, met with the clinical department chairs to review, discuss and outline their plans to initiate a new Council of Chairs aimed at enhancing the patient care, service, and financial performance of our shared clinical enterprise. Among the issues that the Council will discuss and make recommendations about are the budgets for the clinics, clinic staffing and operation in aggregate and by department or unit, facilities on and off campus, allocation of funds flow to the clinical departments, managed care contracting, customer service standards, quality assurance and compliance for the clinics, joint clinical partnerships of SHC with the School of Medicine, professional fee billing and collections, and clinical policy and strategic issues.

The new Council of Chairs will be co-chaired by Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs and Mike Peterson, Chief Operating Officer for SHC. In addition to the co-chairs, the membership of the Council will include the President and CEO of SHC, Dean of the School of Medicine, Senior Associate Dean for Finance and Administration and Chief Financial Officer for SHC, and the chairs of the clinical departments. The Council will meet from 1-3pm on the second and fourth Friday of each month in the MSOB 3rd Floor Conference Room. The first meeting of the Council of Chairs will be held on Friday August 23rd.

With the commencement of the Council of Chairs, the “Internal Governing Council” will be discontinued. However, we will seek opportunities to develop other forums that includes the departmental DFAs. Also, on a quarterly basis, the Council of Chairs will address issues specific and relevant to the Lucile Packard Children’s Hospital (LPCH) with its President and CEO, Chris Dawes. Please recall that the physician leadership for LPCH is being organized separately (see the July 26th Issue of the Dean’s Newsletter).

Martha Marsh and I are committed to making the Council of Chairs an integral and important part of the joint governance of the Medical Centers and the shared mission and operations of the School and SHC in improving patient care.

A Commitment to Diversity: HCOP 2002

Stanford School of Medicine has had a more than three decade commitment to diversity that has included, among others, a Decanal Plan for Diversity, the Minority Biomedical Program, the Stanford Medical Youth Science Program, the Centers of Excellence and the Health Careers Opportunity Program. Individually and collectively these have played an enormous role in improving the diversity of our medical student classes at Stanford and have also served as models to programs around the nation.

On Friday August 2nd, a Celebration of Achievement was held for the 2002 Summer Health Careers Opportunity Program (HCOP). It was a moving and wonderful event and I must commend and thank the HCOP Directors, Ron Garcia, Kathryn Fitzgerald and Fernando Mendoza for their continued and enduring efforts. I also want to thank the

Centers of Excellence Staff, especially Mark Gutierrez and Greg Pearlman, for their efforts along with the support of the Office of Student Affairs.

The Health Careers Opportunity Program is designed to help underrepresented minority college students prepare for medical school. During a six-week program, students who have demonstrated potential academic excellence by taking challenging college math and science courses and who have also demonstrated evidence of community leadership, participate in the HCOP at Stanford. The 2002 Summer HCOP students attend both basic science and clinical programs and emerge much more prepared for taking the next important steps to apply to medical school. They are particularly benefited by their contact, mentorship and guidance by current Stanford Medical students – who serve as teachers and role models and who make this HCOP so successful, meaningful and inspiring to these college students.

I want to particularly thank the Residential Program Coordinators for the 2002 HCOP, Cesar Hernandez, SMS II and Delene Richburg, SMS II. I also want to thank the students and others who served as HCOP Instructors, including: Winifred Adams, SMS II, Marisa Chavez, SMS II, Lawrence “Hy” Doyle, Monica Eneriz, SMSII, Kathryn Fitzgerald, M. Ed, Ron Garcia, PhD, Oscar Gonzalez, SMS II, Phil Harter, MD, Cesar Hernandez, SMS II, Zakee Mathews, MD, Ana Miranda, SMS II, Delene Richburg, SMS II, Fran Rivera, SMS II, Karen Schetzina, MD, MPH, Robert Shaw, SMS and Fred Tovar.

Thanks and Congratulations to all!

Stanford Summer Research Program in Biomedical Sciences

On August 15th, 21 students participating in the Stanford Summer Research Program in the Biomedical Sciences presented the results of the research they participated in during an intensive eight-week program. Students selected for this exceptional program are undergraduates who by reason of their culture, class, race, ethnicity, background, work and life experiences, skills and interests, can bring diversity to graduate study in the biological and biomedical sciences. Admission to the program is rigorous and all students work with mentors and advisors to participate in workshops and a research project. Each of the students presented the results of their work at a special session held in the Munzer Auditorium on Thursday, August 15th.

This is a very special program and special thanks must be given to the Program Staff including Kimberly Griffen and Margo Keeley. I also want to thank the Program Mentors including ChaRandle Jordan, SMS II, John Manak, PhD, Mike Shapiro, PhD, Erica Riddle and Charay Jennings. In addition, appreciation to the Program Faculty must be given to Professors. James Nelson, Ellen Porzig, Bill Newsome, Daniel Madison, Gab Garcia and Ron Davis.

Most importantly, special congratulations must be given to each of the students for their contributions and enrichment of Stanford –and hopefully – themselves.

Help Needed: Arbor Free Clinic

Brooke Cotter, SMS, the Manager of the Arbor Free Clinic, has informed me that physician volunteers are needed. If you are interested or have any questions, please contact the Arbor physician recruiters: vedant@stanford.edu, lmaeda@stanford.edu, carlycox@stanford.edu or arborclinic@stanford.edu.

The Arbor Free Clinic is Stanford's medical student run, volunteer based, free clinic that provides free medical exams and free medications to the sick and uninsured of our community. Arbor Free Clinic is located in the Menlo Park VA, off of Willow road, and is open every Sunday from 11-2. Volunteer physicians have the opportunity to help teach medical students about the care of individuals needing health care in a relaxed and friendly environment. Physicians who are willing to volunteer at the Arbor Free Clinic generally arrive at 11:00 am and are usually done by 2:30 pm. There are 2 or 3 volunteer physicians at Arbor each Sunday.

Per our students, physician volunteers can serve as much or little as they can or would like to – from weekly, monthly or even once a year. Interpreters are on site and the setting at Arbor Free Clinic enables physicians to interact with preclinical students and help launch their careers in medicine. The Arbor Free Clinic serves a diverse population (39% Hispanic, 21% African American, 17% Caucasian, 12% Pacific Islander, 5% Asian) and provides free medical exams, blood tests on site, medications and patient education, and, where necessary, follow-up care. Arbor Free Clinic also sponsors two Children's Back to School Health Fairs and multiple health screening events in the community each year.

On behalf of our students and community, I hope our physician faculty will be willing to offer some time at the Arbor Free Clinic. Again, if you have any questions, please contact the Arbor physician recruiters: vedant@stanford.edu, lmaeda@stanford.edu, carlycox@stanford.edu or arborclinic@stanford.edu.

Dr. Joe Lipsick Named Next Director of the Cancer Biology Program.

Dr. James Nelson, Senior Associate Dean for Graduate Education and Postdoctoral Scholar Affairs has announced that Dr. Joe Lipsick, Professor of Pathology, will succeed Dr. Martin Brown as the next Director of the Cancer Biology Program. Dr. Lipsick was selected through a Search Committee chaired by Dr. Mike Cleary, Professor of Patholgy, began his new responsibilities on August 1st and will serve for a 3-year term.

I want to welcome Dr. Lipsick to this important responsibility in our Biosciences Program. I also want to thank Dr. Martin Brown for the excellent job he has performed as Director.

Congratulations

Professor Daria Mochly-Rosen has been elected to the Leadership Committee of the Council on Basic Cardiovascular Sciences of the American Heart Association.

Congratulations to Dr. Mochly-Rosen.

Appointments and Promotions

- **Gerald Berry** has been reappointed to Associate Professor of Pathology at Stanford University Medical Center, 8/1/02-11/30/06.
- **Andrew Bonham** has been appointed Associate Professor of Surgery (Transplantation) at the Stanford University Medical Center, effective 8/1/02-7/31/07
- **Huy Do** has been reappointed Assistant Professor of Radiology (Neuroradiology) and, by courtesy, of Neurosurgery at the Stanford University Medical Center, 8/1/02 - 7/30/06.
- **Eugene Hoyme** has been reappointed Professor of Pediatrics (Medical Genetics) at the Lucile Packard Children's Hospital at the Stanford University Medical Center, effective 9/1/2002.
- **Sheau Yu Hsu** has been appointed Assistant Professor of Gynecology and Obstetrics, effective 9/1/02-8/31/05.
- **Darius Moshfeghi** has been appointed Assistant Professor of Ophthalmology at the Stanford University Medical Center, effective 9/1/02-8/31/05
- **Ian Whitmore** has been appointed Professor (Teaching) of Surgery (Anatomy), effective 9/1/02-8/31/08.

Congratulations to all.

Announcements

There will be a Town Hall meeting on Monday, September 9th at noon in the Munzer Auditorium. Dr. Mary Lake Polan and members of the Committee on Women in Medicine and Science will present their findings at that time.

Dean's Newsletter September 9, 2002

Welcome to Incoming Medical Students

We welcome today our incoming medical student class to the School of Medicine. Beginning Monday, September 9th, our new medical students will commence their orientation to the School and to Medicine as a profession. They will learn about the practice of medicine in a multicultural society as well as the importance of professional

ethics in their lives and careers. Students will also be informed about the numerous resources available to them within the School and University, including advising and mentoring, student affairs, the role of the ombudsperson, health and counseling resources, etc. In addition, they will be informed about the resources available through Lane Library and SUMMIT, along with other opportunities available throughout Stanford. Of course, the orientation will include an introduction to the curriculum with a special focus on the Fall Course schedule. As you know, the School is also in the midst of major curriculum changes and the impact of this will also be discussed.

Please join me in welcoming our new medical students. Our new graduate students begin arriving on September 20th.

September 11th Remembrance

This Wednesday represents the first anniversary of the tragedies of September 11, 2001, the impacts of which have been etched deeply in all of our minds and souls. At noon on September 11th there will be a Remembrance Ceremony on the University Main Quad. Please make every effort to attend.

Executive Cabinet Retreat - Update on University Resource Need Planning

On Friday, August 30th, the President and Provost held an Executive Cabinet Retreat with the Deans of the Schools of Business, Earth Sciences, Education, Engineering, Law and Medicine as well as the Directors of SLAC and the Hoover Institute, to review the individual and collective plans for programmatic and capital growth during the next decade, and the resources needed to achieve them. In addition to these School-based programs, the Executive Cabinet also heard presentations about three major multidisciplinary initiatives: The Clark Center/BioX, Environmental Science and International Programs.

While everyone agrees that there are extraordinary opportunities for continued program growth and development at Stanford during the next 10-20 years, it is also clear that there are limitations with respect to land use, as well as finances, to support major new initiatives. Accordingly, it is imperative that University Leadership considers the array of proposed plans and initiatives among and between the Schools and then does its best to prioritize and support the most important of them in order to assure the continued success of Stanford University.

As you know, the School of Medicine initiated a comprehensive Strategic Planning effort in September, 2001 that addresses the School's missions in education, research, clinical care, as well as its role viz. information resources and technology, the professoriate, finance and administration, communication, advocacy, public policy and philanthropy. As I have reported in previous Newsletters, many of the strategic initiatives identified during this process are currently being worked on and our progress in completing them is

noted on <http://www.med.stanford.edu/strategicplan/updates.html>. Within the next several weeks the complete Strategic Plan and Executive Summaries will be available for circulation to faculty and leaders in the School and University. In addition to the work being conducted within the School, the School's coordinated clinical planning with Stanford Hospital & Clinics and the Lucile Packard Children's Hospital is also receiving considerable attention in order to assure that the interrelated clinical missions of the School and Hospitals are optimized during the decade ahead. Importantly this will also include planning for facilities and programs within the Medical Center and in relation to the University.

Strategic Planning is a phrase often used to describe an array of activities. Within the School of Medicine, however, the use of this phrase is built on the promise that our past, current and future efforts will act to shape the future of Stanford Medicine. It is important that each member of our community be optimally informed about the plans currently underway, as well as those planned. I encourage members of the Medical School and Medical Center community to offer comments and recommendations. In advance of our next Retreat, to be held on January 30, 2003, I will be updating you of our progress during this past year and plans for the immediate future. I hope you will respond with your thoughts and feedback.

Office of the Senior Dean for Research

I am pleased to announce a reconfigured Office of the Senior Dean for Research. With the decision of Professor James Nelson to focus his efforts on Graduate Education and Postdoctoral Affairs, I have given considerable thought to how best to provide oversight and support for the School's research programs and our specific goal of developing translational research as an overarching theme during the decade ahead. In support of this goal I have decided to recruit two individuals to work collaboratively with the understanding that this will limit the time commitment of each to about a 30% effort, thus permitting these Senior Deans to continue their own research and related activities. I have continued to believe that it is important to have individuals in decanal roles remain active members of our academic community in order to assure that they are cognizant of the issues, opportunities and challenges being faced by our faculty and students.

Based on this formulation, I am very pleased to announce that Dr. John Boothroyd, Professor and former Chair of the Department of Microbiology and Immunology and Dr. Harry Greenberg, Professor of Medicine (Gastroenterology) and former Senior Associate Dean for Research, will work together in directing the Office of Senior Associate Dean for Research. Although their backgrounds are different, their roles will overlap and each will engage the continuum from basic to clinical science.

Professors Boothroyd and Greenberg will both participate in the overall strategic planning for research for the School and will interact with other Senior Associate Deans, chairs, faculty and students within the School and University, as well as in our local and global communities. They will jointly oversee multidisciplinary and translational

research programs as well as the nomination process for major internal and external faculty awards. They will not have separate (i.e., clinical vs. basic science) constituencies but rather will work to assure the connectedness of these communities. At the same time, each will also have some discrete areas of responsibility. These will include:

For Dr. John Boothroyd:

- Interaction with the Research Management Group (RMG) in conjunction with Mike Hindery, Senior Associate Dean for Administration and Finance
- Compliance issues related to experimental animals and biosafety
- Oversight over research core functions

For Dr. Harry Greenberg

- Oversight over conflict of interest policy and implementation
- Compliance issues related to human subjects
- Oversight over the ACCESS program and infrastructure development of clinical and translational research
- Interface with the Palo Alto VA Hospital and its research programs

Dr. Boothroyd will begin his new role on September 15th and Dr. Greenberg will officially commence his responsibilities when he returns from administrative leave on November 1st.

Please join me in welcoming Drs. Boothroyd and Greenberg to their important new roles on behalf of the School of Medicine.

Use of the Stanford Name

At the School of Medicine Executive Committee Meeting on Friday, September 6th, we discussed the use of the Stanford name. The University's Name Use policy is detailed in Administrative Guide Memo 15.5, "Ownership and Use of Stanford Name and Trademarks." A copy is attached and is available online at http://adminguide.stanford.edu/15_5.pdf. It is important for faculty, students and staff to be informed about these policies and their own use of the Stanford name in various professional activities.

The University's policy includes guidelines for use of the Stanford name and marks by faculty, staff, and students. Specifically, Stanford names and marks may be used **only** in connection with Stanford-sponsored or Stanford-sanctioned activities or materials, and use of the Stanford name and marks must meet the following criteria:

Stanford Role

Involvement by individual faculty, students, alumni or staff is not a sufficient basis for indicating University sponsorship or endorsement. The activity must be one in which the University has an institutional role.

Quality

Activities must meet high standards and must be consistent with the University's educational, research and related purposes.

Prohibited Uses

- Name use is prohibited in relation to partisan political activities.
- Name use associated with commercial activity or outside venture must be granted special approval as indicated in Section II below.

University policy specifies when approval is necessary and designates authority delegated by the President for granting such approvals as follows:

- To the Provost for use in connection with educational and research activities, including courseware and related materials developed for teaching at Stanford (see Research Policy Handbook 5.2, "Copyright Policy"), and for special events (see Guide Memo 82.1, "Public Events").
- To the Vice President for Business Affairs and Chief Financial Officer for use in connection with business activities of Stanford or by vendors (including promotional use - see section III below.)
- To the Dean of the School of Medicine for use in connection with medical activities.
- To the Director of University Communications for use in film, video, print, and electronic media, including the University's home pages on the Web.
- To the General Counsel.

Delegated authorities should be executed in a manner consistent with University policies. All questions about interpretation of Stanford's name and trademark use policies should be addressed to:

Beverly Simmonds
Special Assistant to the Dean
Phone: 724-7233
MC: 5110
Email: simmonds@stanford.edu

Translational Research and Medicine

An overarching theme for the School of Medicine during the decade ahead will be translational research. Translational medicine has become a widely used term in the last several years but it has a variety of interpretations and meanings that can be convergent

or disparate among or even within academic medical centers. From my perspective, translational medicine can have both a narrow as well as a more general definition. Perhaps the most specific definition is “bench-to-bedside” research wherein a basic laboratory discovery becomes applicable to the diagnosis, treatment or prevention of a specific disease. Such a discovery is brought forth by either a physician-scientist who works at the interface between the research laboratory and patient care, or by a team that joins basic and clinical science investigators who collaborate in the translation of research findings to the patient care setting.

Often translational research and medicine will be initially focused on a small number of patients but the impact of such patient-oriented clinical research can have wide-sweeping effects on the practice of medicine. There have been numerous examples of such outcomes at Stanford during the past years. I have personally witnessed the impact of translational research during my own work in pediatric oncology, infectious complications in immunocompromised hosts and pediatric AIDS. These experiences have underscored the power of translational research in changing the outcome of serious diseases.

Translational medicine may also refer to the wider-spectrum of patient-oriented research that embraces innovations in technology and biomedical devices, as well as study of new therapies in clinical trials. It includes epidemiological and health outcomes research, as well as studies on behavior that can be brought to the bedside or ambulatory setting. In the absence of translational and patient-oriented clinical research, the delivery of medical care would remain stagnant and uninformed by the tremendous progress now taking place in biomedical science. Thus, translational medicine offers one of the most unique contributions of academic medical centers and teaching hospitals: the prospect of improving current healthcare through state-of-the-art research.

While translational research is critical to the future of Stanford Medicine, our overall research agenda must be much broader and deeper. Current translational research is built on the foundations of fundamental basic research, much of which is undirected and without immediate clinical impact. Indeed, the current focus of translational medicine is built on basic research findings that may have begun years or decades ago. The pipeline for discovery can be long and is not easily managed or regulated. Accordingly, supporting basic research is critically important since it is often not possible to predict which of today’s extraordinary ideas in basic science will have potential clinical application in the future. Thus, if Stanford is to have a successful program in translational medicine it must be built with a very strong emphasis on basic fundamental research. This is the critical foundation and thankfully it is already very strong at Stanford.

In addition to supporting exceptional basic research, the environment at Stanford must also be one that fosters translational research. At a minimum, this means contact and interaction between basic and clinical scientists, as well as an infrastructure that helps to facilitate and support translational research. During the past year I appointed a Task Force on Clinical Research led by Dr. Charles Prober, Professor of Pediatrics and of Microbiology and Immunology, and Scientific Director of the Glaser Pediatric Research

Network. This Task Force has helped to elucidate the key components needed to make our clinical research programs as robust as possible at Stanford and to better align them to public (e.g., the NIH and General Clinical Research Centers) and private foundations, resources and organizations.

An important new initiative in translational research was announced recently by the Beckman Center for Molecular and Genetic Medicine and the Department of Medicine. The jointly funded Interdisciplinary Translational Research Program has earmarked \$1.2 M over three years to support collaboration primarily between physician-investigators and basic scientists.

According to Professor Lucy Shapiro, Director of the Beckman Center, “Our goal is to stimulate research collaborations across a number of disciplines, encompassing many schools within the University, including Engineering and Humanities and Sciences.” Dr. Shapiro, with Professor Judith Swain, Chair of the Department of Medicine, established the novel program and led the search for qualified candidates.

As a result of the commitment of Professors Shapiro and Swain, eight recipients will each receive a total of \$150,000 over three years to support translational research in areas ranging from vascular interventions to stem cells to bioinformatics. Each of the projects is composed of a team of two or more investigators, including a physician scientist and a basic scientist, and at least one trainee. The recently announced awardees and their project interests include:

- Gilbert Chu (Medicine/Oncology, Biochemistry), Robert Tibshirani (Biostatistics/Genetics), and Dick Zare (Chemistry): “Protein Profiling to Predict Breast Cancer after Radiation Therapy”
- Seung Kim (Developmental Biology, Medicine) and Judith Shizuru (Medicine/Bone Marrow Transplantation): “Transplantation of Embryonic Stem Cell-Derived Islets in Diabetes Mellitus”
- Peter N. Kao (Medicine/Pulmonary and Critical Care), Judith Shizuru (Medicine/Bone Marrow Transplantation), and Christopher Contag (Pediatrics, Microbiology, Immunology, and Radiology): “Lung Regeneration from Bone Marrow Stem Cells”
- Gary K. Schoolnik (Medicine/Infectious Diseases and Geographic Medicine) and Alfred Spormann (Engineering): “Biofilm Development in Vivo: A Genetic Bioinformatics and Bioengineering Analysis”
- Eric T. Kool and Ellen Jo Brown (Pathology): “Rapid Color-Based Identification of Pathogenic Bacteria”
- David Liang (Medicine/Cardiovascular Medicine) and Fritz Prinz (Engineering): “Microfabricated Devices for Vascular Interventions”

- Hongjie Dai and Paul J. Utz (Medicine/Rheumatology and Immunology):
“Development of Non-Fluorescence-Based Detection Methods for Proteomics Studies: Carbon Nanotubes as Molecular Sensors”
- John P. Cooke (Medicine/Cardiovascular Disease) and Richard Zare (Chemistry):
“Development for a Novel Cardiovascular Risk Factor”

Again, special thanks must go to Professors Shapiro and Swain for their foresight in initiating this program and for their financial support in bringing it to fruition.

At the broader institutional level, in addition to supporting faculty initiatives we are also seeking to develop Institutes that will bring together basic and clinical scientists to address areas of translational medicine. During the next couple of years we envision these will take on specific themes, such as the Stanford Cancer and Stem Cell Biology Institute, or the Stanford Institutes for Neurosciences, Infection and Immunity and Cardiovascular Diseases. We hope that these and related programs will foster communication and collaboration between our scientific and patient care communities and, most importantly, generate knowledge that will improve the lives of adults and children.

I also believe that the future success of translational medicine will be more readily achieved by educating and training medical and graduate students about the important interface that links medicine and science. Indeed it is my hope that the students we teach today will play an important role in bringing forth the translational research discoveries of tomorrow.

Appreciation of Lucile Packard Children’s Hospital (LPCH) Leadership and Staff

At the LPCH Board of Directors Meeting on Thursday, September 5th, the end-of-year performance for the hospital was presented. The results were very impressive.

This has been an enormously challenging year for LPCH, hallmarked by significant increases in patient volume and bed utilization, especially in the Intensive Care Units and Operating Rooms. Although much of this is attributable to the new world-class cardiac program evolving under the leadership of Dr. Frank Hanley, who was recruited to Stanford in November, 2001, there have also been significant increases in other critically important programs including solid organ transplantation and cancer, among others. These rapid and dramatic changes have challenged and stressed the medical, nursing and other professional staff at LPCH. They, in turn, have responded remarkably well in delivering exceptional medical and surgical care in a family centered manner to seriously ill children. Because of their efforts and those of the leaders of LPCH, the overall financial performance of the hospital has recovered from its recent deficits to a much healthier state. Such a recovery will prove critically important in enabling LPCH to continue its trajectory toward becoming one of the leading children’s hospitals in the world.

I want to thank the faculty and staff who have worked enormously hard to deliver outstanding pediatric care during this past year. I had the privilege of serving as an attending physician at LPCH in August and can affirm, first hand, the outstanding care that is being delivered to children. I also want to acknowledge and thank the leadership of LPCH, especially Mr. Chris Dawes, President and CEO, and Ms. Sue Flanagan, Chief Operating Officer, for the enormous contributions they have made to improving the delivery of clinical care to seriously ill children, and to the very effective relationships they have forged with the faculty of the School of Medicine led by Dr. Harvey Cohen, who has served as both Chair of Pediatrics at Stanford and as Chief of Staff at LPCH. These leaders have truly served as institutional stewards during an important and challenging time of transition for LPCH.

Increased Role of the School of Medicine in Graduate Medical Education

Although the role of the School in graduate medical education for residents has been limited in recent years, I believe it is important that this be changed and that the School become much more involved and engaged in resident education. This is important in helping to assure the success, vitality and viability of training programs at SHC, LPCH and other affiliates, especially given the important interrelationship of resident and fellow training with medical student education. I conveyed the interests of the School in resident education to the GME Committee meeting on Thursday, September 5th, and also indicated that the important role that program directors (and clerkship directors) have will be included in the appointment and promotion criteria for faculty in the future.

Announcements

Town Hall Meeting for Medical Students

Deans Pizzo and Parsonnet will be holding a special Town Hall Meeting on Monday, September 30th at 7:00 p.m. in the Fairchild Auditorium. Topics for discussion will be advising, dean's letter, curriculum, etc.

Please make every effort to attend.

Symposium of the Ellison Medical Foundation at Stanford University School of Medicine

A symposium on aging and infectious diseases will take place on Thursday, September 19th in the Munzer Auditorium, Beckman Center. Speakers include Dr. David Relman of Stanford's Department of Microbiology and Immunology and Dr. Joshua Lederberg of Rockefeller University, just to name a few. Please visit the website: <http://reggie.Stanford.edu/SignupForm1.asp?611> for registration and parking information.

Congratulations to Dr. Tom Krummel

Dr. Tom Krummel, Chair of the Department of Surgery at Sanford, has recently also been appointed the Surgeon-in-Chief of the Lucile Packard Children's Hospital, effective September 1, 2002. This newly endowed position at LPCH is made possible by a gift from Susan B. Ford and will enable LPCH to achieve its goal of preeminence and sustainability. In this position Dr. Krummel will play a critical role in helping develop surgical programs, including the retention and recruitment of nationally and internationally recognized surgeons. As Surgeon-in-Chief, Dr. Krummel will also be appointed to the hospital's Executive Management Committee and to the hospital's Board of Directors.

Congratulations to Professor Emeritus Luigi Luca Cavalli-Sforza

The Foundation for the Future has named Professor Emeritus Luigi Luca Cavalli-Sforza as its 2002 winner of the Kistler Prize. This distinguished award is given annually to an investigator whose original research has increased knowledge and understanding of the relationships between the human genome and society. Professor Cavalli-Sforza has traced historical migrations by analyzing the genetic diversity and phylogeny of human populations dating back as long as 100,000 years of human and cultural evolution.

Congratulations to Professor Cavalli-Sforza

Appointments and Promotions

Eugene Carragee has been promoted to Professor of Orthopedic Surgery at Stanford University Medical Center, effective 9/1/02

Sheau Yu Hsu has been appointed Assistant Professor of Obstetrics and Gynecology, 9/1/02-8/31/05

Ian Whitmore has been appointed Professor of Surgery (Anatomy) (Teaching), 9/1/02-8/31/08

Dean's Newsletter September 23, 2002

Professor David Botstein Will Move to Princeton

On Sunday, September 22nd, Princeton University announced officially that Dr. David Botstein, the Stanford Ascherman, M.D., Professor of Genetics, will become the new Director of the Lewis-Sigler Institute for Integrative Genomics. Although this represents a wonderful opportunity for Professor Botstein and for Princeton, it must be quickly acknowledged that Stanford will lose an extraordinary intellectual force whose contributions have been nothing short of spectacular. During his remarkable career, Professor Botstein has played a seminal role in the discovery of important yeast and bacterial genes, sequencing of the yeast genome, laying the intellectual and technical groundwork for mapping genes that led to the Human Genome Project, leading the efforts in biocomputation that are now governing the future of biology and, with Professor Pat Brown, leading Stanford's important contributions in the use of DNA microarrays to diagnose and categorize a number of human diseases, including cancer. In addition to these and many other breath-taking research contributions, he has been a committed teacher and innovator and has impacted significantly the careers of many students, postdocs and faculty members. He will play an important role in teaching and education at Princeton, in addition to his leadership of the Lewis-Sigler Institute.

Although someone of Professor Botstein's stature is simply irreplaceable, we must congratulate him and Princeton. We will now have to look east to benefit from his future contributions in research and education.

Our Incoming 2002 Stanford Medical Student Class

Our First Year Medical students officially began their academic year this past week. I thought you might like to know a little about this new Stanford class. It includes 86 students who were selected from 5239 applicants. Seven members of the incoming class were deferrals from previous years and nine of those admitted this year have deferred enrollment to 2003 or later. The average age is 22.9 years with a range of 19-31 years. A slight majority (53%) of the new class are women and 21% are underrepresented minority students. Fifteen percent have advanced degrees (6 Ph.D., 11 Masters of Arts or Science). The incoming students have performed very well as undergraduates, with an overall GPA of 3.74 and a science GPA of 3. Seventy-one incoming students come to Stanford from throughout the USA and 19 were born in foreign countries. They also come from 38 colleges and universities, with the largest number coming from Stanford (17 students) and Harvard (9 students) but with 25 schools being represented by a single student. Thus this is a diverse and highly talented class and we are most pleased to welcome them to Stanford.

Faces of the Community 2002

A rather extraordinary program entitled "Faces of the Community" was included during the orientation of our incoming medical students. This program offered a very moving portrait of the different personal and professional lives of eight of our current students. Each student provided a meaningful and very insightful description of his or her differences and similarities as "faces" within our community - both at Stanford and more globally. This program is available at the following URL:

<http://lanevid.stanford.edu:2020/ramgen/StudentResources/faces2002.smi>. I strongly recommend that you take the time to view it. I am confident that you will be deeply moved by these portraits. I found this to be a remarkable program.

Welcome to the 2002 Stanford Graduate Students in the Biosciences

Our 2002 Biosciences Graduate student class joined Stanford this past weekend. Following a “bonding” Biomass camping trip that occurred on September 20-21, our new graduate students will begin their more official orientation on Tuesday, September 24th, including a dinner at the Arrillaga Alumni Center.

Our new graduate students number 76 and represent 8 countries, including the USA, Taiwan, Thailand, Israel, Italy, Germany, China and South Korea. Ten of the new students are from underrepresented minorities and an additional ten are Asian. Of the new graduate students, 39 are male and 37 are female. Ten undergraduate institutions have several graduates in this class including: Stanford, Harvard, Yale, UC Berkeley, MIT, CalTech, Princeton, U. Michigan, UC San Diego and Cornell. Overall, the entering class was selected from more than 44 different undergraduate institutions. This is an outstanding group of young scientists by any criterion.

The CGAP (Committee on Graduate Education and Policy) is also planning a new seminar series for the entering graduate students, where Biosciences faculty will present their latest research. It will be held on Tuesdays, Wednesdays and Thursdays at noon beginning this fall. Faculty and medical students are also welcome to join with the graduate students in attending this seminar series.

IRT Begins Rolling Out New Wireless Network

The School of Medicine's Office of Information Resources and Technology (IRT) has announced that Phase One of a new wireless network will be available as of September 23, 2002. The initial rollout will provide wireless access in areas of high student usage, such as Lane Library, the CCSR cafe and basement classrooms, the new student lounge, the Alumni Green and the Dean's Courtyard. Additional information about the School's wireless network and how to access it is available at <http://www.med.stanford.edu/irt/wireless/>.

Town Hall Meeting on Women in Science and Medicine

On Monday, September 9th, Dr. Mary Lake Polan, Professor and Chair of the Department of Obstetrics & Gynecology, led a Town Hall meeting on Women in Medicine and Science. She presented the results of a survey that was conducted with women faculty at the Stanford University School of Medicine in February of 2002. Of the 309 faculty and staff physicians who received the survey, 163 (53%) responded.

Among the issues deemed important by those who participated in the survey, the three areas felt to be most significant were:

1. A flexible work environment, without negative consequences, for women with responsibilities for the care of young children or with responsibilities for elder care.
2. Departmental mentoring for grant preparation and academic career development and advancement.
3. The opportunity for a mini-sabbatical (e.g., 3 months) from clinical or administrative responsibilities at the end of an appointment cycle in order to enhance academic/career development.

The discussion at the Town Hall meeting recognized that these and other items were not gender specific but acknowledged that women may be more stigmatized by requesting special resources or adaptations to the work schedule or environment. Clearly this necessitates a cultural change in order to avoid real or perceived retribution. It also requires resources to help fund special programs to make these adaptations possible.

The Committee on Women in Science will also present their findings to the School's Executive Committee in October. It is our hope to then work toward a timeline for implementing the recommendations that is feasible and which we believe will provide an improved work environment for women in medicine and science.

Committee on Faculty Diversity Report

On Friday, September 20th, the Committee for Faculty Diversity, Chaired by Dr. Fernando Mendoza, presented their report to the Medical School Executive Committee. This report was delivered in response to the charge provided by Dr. David Stevenson, Senior Associate Dean for Academic Affairs, in the fall of 2001: "Consider how the School can enhance its ongoing efforts to increase the representation of diversity in the professoriate and to address the professional well-being and success of a diverse faculty." The Committee's report indicated that while a great deal has been accomplished in the past decades, much work still remains. For instance, while we do well with medical student minority recruitments, we don't do as well with graduate student and post-doc recruitments, and do even less with faculty recruitments.

The Committee believes that in order to sustain our progress and make additional improvements, future efforts require a clear mission, resources, long term commitment, and a formal infrastructure (i.e., a Center for Diversity). The Committee's specific recommendations included the following:

- Establish an Office of Faculty Diversity and sufficiently fund it to meet its objectives
- Establish routine monitoring of diversity recruitment and promotion in all facets of the Medical School (medical students, residents, graduate students, post-doctoral students, faculty and medical school leadership).
- Organize a centralized recruitment effort for residents and fellows in all Departments

- Develop and fund innovative programs to recruit diverse faculty
- Achieve diversity in the leadership of the Dean's Office

Specific goals for an Office of Faculty Diversity would include:

- Increasing the numbers of faculty and trainees from diverse backgrounds
- Centralizing recruitment assistance and monitoring of diversity
- Creating a Faculty Development Center with group-specific, yet integrated, programs
- Enhancing mentoring and monitoring through the creation of an Individual Academic Plan (IAP) for each Assistant Professor (i.e., all faculty, not only minority faculty)

Following the Committee's presentation it was determined that this topic should be taken to the Senior Associate Deans for additional review, and should then be brought back to the Executive Committee for further discussion. This is an important topic and one that merits continued, focused dialogue and planning. I wish to thank Dr. Mendoza and the rest of the Committee (Drs. Roy King, Phyllis Dennery, Iris Gibbs, Oscar Salvatierra, Yvonne Maldonado, Ray Gaeta, Steven Fong, Minnie Sarwal, Kelly Skeff, and Stanley Falkow) for their thoughtful and productive work in this area. I look forward to seeing this work move forward, and will be providing additional updates on these important activities as this work evolves.

Changes in Health Insurance

Continuing changes in health insurance around this country and in the Bay Area creates confusion and anxiety among consumers as well as providers of health care. In the September 19th issues of the New England Journal of Medicine, J.K. Inglehart reviews "Changing Health Insurance Trends": <http://content.nejm.org/cgi/content/full/347/12/956>

Update on Tolerance and Professionalism in the Workplace

As many of you will recall, last Spring a number of posters and other materials for the Lesbian, Gay, Bisexual and Transgender's (LGBT's) "Queer Health and Medicine" course were defaced or torn down. This was disgraceful and very disturbing for our students, faculty and community within the School and University. Although we have not been successful at discovering who committed these acts of intolerance, we have responded quickly and strongly to this hateful and inexcusable behavior. As the new school year begins I want to reiterate that acts of hate at our institution will not be tolerated under any circumstances, and I wish to provide this readership with an update of actions that have been taken over the summer to prevent such acts from recurring.

---Security---

The School has been working closely with Medical Center Security, as well as the Stanford and Palo Alto Police Departments, to investigate these acts. We have installed four surveillance cameras in locations where these acts occurred last spring, and we are currently discussing potential additional security measures that may be taken to prevent

further incidents from occurring. We are also developing policies re: advertising and poster hanging. We will be communicating the outcomes of these discussions as soon as final decisions have been made. In the interim, however, I wish to restate that the security and safety of our students, postdocs, faculty and staff continues to be our very highest priority, and we will continue to do everything possible to guarantee this safety and to promote a respectful work and learning environment.

---Sensitivity Training---

The Medical School HR Department is incorporating respectful workplace training into the hiring and training of Stanford Medical School faculty and staff. In addition, members of the Dean's Office, in concert with the HR Department and Ombudsperson, are meeting with each Department to conduct further discussion and training concerning the respectful work place. Similar sessions with students are being discussed as well. I welcome any input students may wish to provide on this topic.

---Curriculum Issues---

We are currently discussing how best to address cultural competency issues as a required part of the curriculum. A working group, consisting of Drs. Gabe Garcia, Fernando Mendoza, Elliott Wolfe and Ron Garcia, will be charged with the responsibility of developing a recommendation in support of curriculum related to LGBT and to clinical competence overall. This group will work jointly with students on this effort. Although it seems unlikely that we will be able to construct something for the first year students in the required fall curriculum, there should be space available in the winter and in the spring curriculum. In addition, Dr. Julie Parsonnet, Senior Associate Dean for Medical Education has asked for added emphasis in Preparation for Clinical Medicine (PCM) for second year students; Dr. Neil Gesundheit, who is in charge of our curriculum reform program for the class entering in 2003, will make sure that this is a required element of the new curriculum. Once the working group makes its recommendations we will then move to the review and approval process (either via the Committee on Courses and Curriculum (CCC) or the Faculty Senate, depending on the specific recommendation). I will be providing additional updates on this work as it progresses.

---Administrative Support---

In June an Advisory Group, consisting of senior University and Medical School administrators and faculty, was convened to discuss the acts of intolerance that targeted the LGBT community. At this meeting the group:

- Reaffirmed the focus of the University's and Medical School's attention on safety concerns and on creating a respectful working and learning environment.
- Reviewed the status of the police investigation regarding all known acts of intolerance.
- Agreed that greater dissemination of information about such incidents, and the University's response, should be provided throughout the campus community.

In addition, the group decided that ***any future acts of intolerance should be reported to Medical Center Security as the first point of contact re: any incident in and around the Medical School or Hospital.*** (This is important to know, as there are three agencies involved: Medical Center Security, Stanford Police, and Palo Alto Police.) The Medical Center Security dispatch center is in operation 24/7 and can be reached at 723-7222. ***Such acts also should be reported to the Special Assistant to the Dean at 724-1661.*** This role will serve as an information clearinghouse and as the Dean's Office administrative coordinator concerning acts of intolerance.

---Emergency Information Cards---

I strongly encourage all members of the School of Medicine to carry their "Emergency Instructions" wallet card with them at all times. This card, developed by the School's Health and Safety Programs Office, indicates the various numbers to call in case of emergency, and also provides space for you to fill in your specific Emergency Assembly Point (EAP) location in the case of an evacuation. Our Health and Safety Programs Office also has made available emergency phone number placards for all office/lab areas, as well as emergency contact stickers for telephones. All of these materials can be obtained through your Department Administrator. For more information on these and other important Health and Safety initiatives, please contact 3-0110 or visit their web site at: <http://somsafety.stanford.edu/>.

I believe our collective efforts have resulted in progress during the past months. I would like to thank the many students, faculty and staff within the School and from across campus who have worked closely with us on moving these issues forward. I will be providing additional updates in future editions of the Newsletter, and I welcome any input that you may wish to provide.

New Faculty Advisors

Dr. Julie Parsonnet, Senior Associate Dean for Medical Education has announced the group of faculty who has been selected to serve as Faculty Advisors to our medical students. Dr. Terry Blaschke, Professor of Medicine, will direct this program and will be joined by Drs. Denise Johnson (Surgery), Susan Knox (Radiation Oncology) and Kuldev Singh (Ophthalmology), each of whom will serve as Assistant Deans. This is a terrific group of faculty who all care deeply about students, medicine and education.

In addition, Dr. Elliott Wolfe has assumed the new position of Director of the Office of Medical Student Professional Development and will work with students regarding career and professional choices.

I am very pleased that such an excellent and committed group of individuals has agreed to serve as Faculty Advisors and I am confident that they will each play an important role in helping to guide the career development of our students. In addition to the advising program, we will also be further developing a mentoring program for our students. Details about this will be forthcoming.

Update on the Arbor Free Clinic Children's Health Fair

After sponsoring a very successful first fair on June 15th, the Arbor Free Clinic sponsored a second Children's Health Fair on Saturday, August 24th. This second fair was also a great success. The Fair was held at the South County Community Health Center in East Palo Alto. One hundred thirteen children were served at the Fair. Seventy-three children received physicals, and 89 children received immunizations. To help address the dental health needs of low-income children, a mobile dental van returned on September 7th to provide free dental exams, x-rays, and cleanings for 38 children who were signed up for these services at the Fair.

The Health Fair sought to not only provide medical care, but also to help families access more long-term care. Benefits analysts from the San Mateo County Health Department helped enroll or provide information about MediCal and Healthy Families medical insurance programs for dozens of families.

The success of this fair is due in no small part to the many volunteers who generously donated their time and talents to the fair. The volunteers consisted of approximately 60 physicians, nurses, medical students, undergraduate students, and translators. The translators and other Spanish-speaking volunteers were particularly important, since many of the patients spoke Spanish as their primary language.

For more information on these or future fairs, please contact Monica Eneriz (meneriz@stanford.edu) or Natalie Pageler (npageler@stanford.edu). I also want to thank Monica and Natalie, along with their student colleagues, for their dedication and commitment.

Events

A Mini-Course in Medicine, focusing on Immunology and Rheumatology, was presented to the public community by the Center for Clinical Immunology at Stanford (CCIS) on Tuesday evening, September 17th at the Arrillaga Center. More than 250 people attended the evening event that featured presentations and discussions on multiple sclerosis, rheumatoid arthritis, insulin-dependent diabetes, cancer immunology and stem cell research. Special thanks go to C. Garrison Fathman, Professor of Medicine, for assembling wonderful faculty and presentations, and to Mike Welch from the Office of Medical Development for playing an essential role in organizing the evening event. I also want to acknowledge the exceptional support of the Saal family, who have been such great friends of Stanford and the CCIS program in particular. We are most appreciative.

Ellison Foundation Symposium on "Global Infectious Diseases and the Biology of Aging". On Thursday, September 19th, Stanford served as host to the Ellison Medical Foundation symposium that featured, among others, an excellent presentation by Dr. David Relman, Associate Professor of Medicine (Infectious Diseases) and of Microbiology and Immunology. Dr. Relman is also a recipient of

a 2001 Ellison Medical Foundation Senior Scholar Award. We also had the pleasure of spending time with the Foundation's outstanding scientific advisory board, chaired by Dr. Joshua Lederberg, President Emeritus at the Rockefeller University and former Chair of Genetics at Stanford University School of Medicine.

Congratulations

Dr. Pat Brown: On September 17th, the Takeda Foundation announced that Dr. Pat Brown, Professor of Biochemistry at Stanford and Investigator in the Howard Hughes Medical Institute, was a winner of its 100 Million Yen Awards for Achievements in Engineering. This major award, which was established last year, is to be presented annually to individuals who have made outstanding achievements in creating and applying new engineering intellect and knowledge in three fields: social/economic well-being (information and electronics), individual/humanity well-being (the life sciences), and world environmental well-being.

The technical achievement honored by the Takeda Award 2002 Techno-Entrepreneurial Achievement for Individual/Humanity Well-Being is "the development and promotion of DNA Microarrays." The prize is awarded jointly to Dr. Pat. Brown (Stanford University) and to Stephen P.A. Fodor (Affymetrix Inc.).

Dr. Linda Cork, Professor and Chair, Department of Comparative Medicine, has been elected as a Distinguished Member of the American College of Veterinary Pathologists. This honor is based on extraordinary contributions to the field of Veterinary Medicine.

Stanford Team Lands NIH Proteomics Contract: A team of Stanford scientists, lead by Dr. Garry Nolan, along with Drs. Juan Santiago, P.J. Utz, Bill Robinson, Larry Steinman, Gil Chu, and Rob Tibashirani, have been successful in winning a \$14M contract from the National Heart, Lung and Blood Institute for the Stanford Proteomics Center.

Congratulations to all.

Announcements

Town Hall Meeting for Medical Students:

On Monday, September 30th, a special Town Hall Meeting will be held at 7:00 p.m. in the Fairchild Auditorium. Topics for discussion will be advising, Dean's Letter, curriculum, etc. All Medical Students are welcome to attend.

Symposium for Stanford Clinical Research Personnel:

On Monday, October 7th, there will be a symposium on the "Safety and Accountability in Clinical Research at Stanford" in the Fairchild Auditorium from

8:30 a.m. to 4:30 p.m. The Audience will consist of clinical investigators, research nurses, clinical research coordinators, fellows, students, research pharmacists, research administrators, hospital staff involved in clinical trials, and others interested in safeguarding the rights and welfare of human subjects in clinical research. Pre-registration is required by September 27th. Please refer to the following URL: <http://reggie.Stanford.edu/signup.asp?602>

Dean's Newsletter

October 7, 2002

Town Hall Meeting with Medical Students

On Monday evening, September 30th, a Town Hall Meeting was held for medical students to review a menu of relevant issues, including an update on the planning for education facilities, the new advising system, the latest on the "Dean's Letter" and an update on the status of the Family Medicine Clerkship. Several of these important issues have evoked concern among students and faculty. The goal of the Town Meeting was to provide information as well as to solicit input and evoke discussion. Dr. Julie Parsonnet, Senior Associate Dean for Medical Education led the Town Hall meeting, which was well attended by students, and held in Fairchild Auditorium from 7-9 p.m. Following are some of the highlights:

The Dean's Letter: As discussed in prior Newsletters, efforts have been underway to revise the Dean's Letter for students applying for internships in this academic year. This is largely based on fact that we have learned from Residency Program Directors at Stanford as well as from around the country that the format of the Stanford Dean's Letter used during the past several years has not been serving our students well. Given the absence of a grading or ranking system at Stanford (which we continue to value) the recent Dean's letters are perceived as being too subjective and not providing readers objective information to accurately determine the true strengths of our students or to discriminate among them. Based on these very important concerns, a number of steps have already been taken to remedy this situation by Dr. Parsonnet, including having the Dean's letters written by four faculty advisors (rather than one) and having them discussed by the group as a whole in order to assure that each letter is fair, accurate, and balanced in their reflections on student performance, especially during clinical clerkships. There needs to be recognition that the Dean's Letter is the official evaluation by the School of the student – and not a letter of recommendation (as it appears to have become in recent years).

A major point of controversy and debate however has been whether the final paragraph of the Dean's Letter would contain a summative statement – more specifically, identifying students as "outstanding", "excellent" or "very good". This is the practice of virtually every other medical school but is clearly

problematic at Stanford given its longstanding practice of not ranking students. While students are evaluated during their clinical clerkships, there is also a concern that the current evaluation system is not as robust or consistent as it should be. Accordingly, Dr. Parsonnet and her staff have determined that a summative statement (e.g., outstanding, excellent or very good) would **not** be included in the Dean's Letters currently being written for this year's graduating class. That said, every effort is being made to have the information about the student's performance on clinical rotations be as complete and accurate as possible so that residency program directors are able to make the best judgments possible on behalf of our students.

At the same time, efforts are already underway to assure that the evaluation system for clinical clerkships is as outstanding as possible – and to do so immediately, so that concerns about this will not confound our ability to write an objective and evaluative Dean's Letter in future years.

Recognizing all the concerns that have been engendered, I repeat the message I offered in my Newsletter of July 2nd: “While I understand the concerns about competitive environments, and absolutely would not want to see one develop at Stanford, I do not understand how an objective process of assessment and evaluation can be viewed as negative in relation to one's performance in clinical care. The goal of every student, just like every physician, should be to carry out her or his clinical care responsibilities in the very best manner possible. The competition in clinical care is really with oneself — to do the very best possible to care for one's patients. Naturally, one's interests and abilities in various areas of medicine will further guide one's individual performance. It is erroneous to think that we all have the same skills in every area and facet of medicine — or the same level of interest.”

Moreover, as I pointed out at the Town Hall Meeting, performance evaluation is mandated in every residency program and is increasingly expected for physicians in practice. Our patients want to know that we care about our proficiency and that we take seriously efforts to perform our clinical responsibilities in the very best way possible. I am confident that our students also want to perform their clinical responsibilities in as outstanding a manner as they can, and it is our mutual responsibility to help them accomplish that – and to help evaluate their performance so that they can become the very best physician they can possibly be.

Curriculum Updates: Senior Associate Dean Parsonnet also led the discussion on the plans to revise the curriculum with the goal of implementing changes for the class entering in September 2003. The key goals are to define the core curriculum, begin clinical training in parallel with basic science education and to continue these throughout all years of medical school, and develop “scholarly tracks” or “majors” for all medical students. Updates on progress to date follow:

- ***The Committee to Define the Core Curriculum***, chaired by Dr. Neil Gesundheit, has been charged to define the core concepts that each

medical student should master to be an outstanding clinician. The Committee has divided the preclinical curriculum into four "affinity" groups, each of which is comprised of courses that share common themes and in which teaching synergy is likely to occur. The affinity groups are entitled "Structure," "Molecular Science," "Disease and Therapeutics," and "Clinical Science," and the groups are led by Drs. Larry Mathers, James Ford, Donald Regula, and Peter Rudd, respectively. In addition, there are four student committee members, Vedant Kulkarni, Elizabeth Langen, Brett Pariseau, and Al Taira, and three staff facilitators, Elizabeth Moreno, Margaret Sequeira, and Jenn Stringer. The Committee has been asked to examine ways to improve instruction methods and efficiencies, with the goal of achieving a 20% reduction of instruction time during the preclinical years. The reduction in instruction time will allow students to take graduate courses and seminars in areas of special interest and to pursue research either through the current Medical Scholars or the emerging "scholarly tracks" programs (see below). The goal of the Committee is to present a draft of the new curriculum to the Committee on Courses and Curriculum (CCC) this fall and to the Faculty Senate and Executive Committee for their review in winter. If consensus is achieved, the new curriculum would be ready to begin during the 2003-04 academic year.

- ***The Committee on Scholarly Tracks*** is chaired by Dr. Gary Schoolnick, along with Rosalinda Alverado (Medical Student), Margaret (Minx) Fuller (Developmental Biology), Brian Hoffman (Medicine/Endocrinology), Emmet Keeffe (Medicine/GI), Ted Leng (Medical Student), Yvonne (Bonnie) Maldonado (Pediatrics), Doug Owens (Medicine/GIM), Audrey Shafer (Anesthesiology), Tim Stanton (PriSMS), Charlie Taylor (Surgery/Vascular Surgery and Engineering), and David O'Brien (Institutional Planning). Because of a prior commitment, Dr. Schoolnick was unable to attend the Town Hall Meeting but Dr. Parsonnet gave an update on the status of the Scholarly Tracks. Specifically, plans are underway to issue RFAs for the support of the initial Scholarly Tracks, each of which will need to develop a program of course work, mentoring and research opportunities for students. It is expected that all students will eventually participate in a Scholarly Track, making their selection during their first year but with the flexibility to change tracks based on evolving interests. Work is also underway to develop a general study track for students who require more independent study. Again, it is anticipated that the initial Scholarly Tracks will be available for students entering in September 2003.

Education Facilities Planning: I gave an update on the progress we have made in interim facilities renovation of classrooms, student lounge areas, library, etc. and the timeline for their completion during the next academic year. I also gave a

status report on the SMILE (Stanford Medicine Information and Learning Environment) Project, including its current scope, planned location and approximate timeline. This is my highest priority project for capital development for the School and it is our very definite hope to complete it by no later than 2008-2009. Parenthetically, those years are respectively, the centennial of the founding of the Stanford University School of Medicine, and the 50th Anniversary of the location of the School and Hospitals on the Stanford campus. I also described the site that will likely house SMILE, which is adjacent to the Clark Center and Beckman Center – more details will follow shortly.

Family Medicine Clerkship. Recognizing the important and valuable role that the family medicine clerkship provides to our students, I am pleased to announce that we are forming a Center for Education in Family and Community Medicine within the Office of Student Affairs. Dr. Sam LeBaron, Associate Professor of Medicine (Family Medicine) will serve as the first director. In addition to overseeing the clinical clerkship in family medicine, it is my hope that this new Center will provide an umbrella over the various important community based initiatives within the School. I very much value the many contributions made by faculty and students to improving the lives of our broader community through care, education and research. The new Center provides further evidence of the School's commitment to this important area.

Restructuring Plans for Information Resources and Technology

Senior Associate Dean for Information Resources and Technology (IRT), Dr. Henry Lowe, has asked me to inform you that on October 1, the School launched a new organization dedicated to providing innovative and effective information technology (IT) and knowledge access services to the Stanford biomedical community. Since it was established in March of this year, the Office of Information Resources and Technology (IRT) has been developing a new organizational structure that combines the exceptional talents of the staff of Lane Library, MedIT and SUMMIT with those of recently recruited IT professionals to create a newly integrated organization that will effectively support the Schools clinical, research, educational and community outreach missions. Under the direction of Dr. Lowe, this organization is currently engaged in a comprehensive IT strategic planning process, while also working on a number of urgent IT problems related to data center services, wireless networking infrastructure, IT security, database support, HIPAA-compliance, knowledge access tools and learning technologies. The overall goal of IRT is the development of an innovative information technology infrastructure and knowledge access environment that can support Stanford's biomedical community. This infrastructure will be designed to address critical, real-world problems that face our community. It will be developed collaboratively using a process that brings together information technology, library science and biomedical domain expertise both from within Stanford and from regional, national and international partners. The new Stanford Biomedicine information technology and knowledge resource infrastructure will be standards-based, innovative, user-centric and designed to support the essential systems inter-operability that will ensure the free flow of the data and knowledge that drives

patient care, research and education. IRT is committed to providing our community with access to information to support their missions while protecting the privacy and confidentiality of that information.

To learn more about the new IRT organization visit its website at <http://www.med.stanford.edu/irt/> or email IRT at irt@med.stanford.edu

Farewell and Welcome

October 4th was the final day for Ms. Beverly Simmonds, Special Assistant to the Dean. Ms. Simmonds leaves for Boston with her husband who is being relocated to that fair city. Bev joined the Dean's office just a year ago, having previously been the DFA for Biochemistry. Since joining the Stanford community nearly four years ago, Bev has done an outstanding job in every position she has held. I will miss her tremendously as will her many friends and at the School and the University. I want to take the opportunity to thank Bev for all the helpful and important work she has conducted for the School and especially for her invaluable role as Special Assistant.

While wishing Bev a fond farewell, I am also very pleased to announce that Kathryn Gillam, Senior Associate Provost for Faculty Affairs and Foundation Relations will replace Bev Simmonds as Special Assistant to the Dean beginning October 28th. Dr. Gillam has had an extremely distinguished career at Stanford during the past 12 years and I am enormously pleased that she has agreed to join the Dean's Office in this important position.

I am also pleased to welcome Ms. Ellen Waxman who will assume the new position of Director of Academic Reviews and Investigations reporting to Dr. David Stevenson, Senior Associate Dean for Academic Affairs. Ms. Waxman previously served as university ombuds and director of the Stanford Mediation Center. We are extremely pleased that she will be joining the Dean's office in this new and important position.

Past Events

- **Graduate Student Dinner:** On Tuesday evening, September 24th our incoming Graduate Student Class joined faculty for a festive welcoming dinner at the Arrillaga Center. Dr. James Nelson, Senior Associate Dean for Graduate Student and Postdoctoral Education served as the host. Once again, as noted in the September 23rd Newsletter, we are fortunate to have attracted another spectacular class of graduate students to Stanford.
- **Stethoscope Ceremony:** On Wednesday evening, September 25th the Annual Stethoscope Ceremony was held to welcome incoming medical students and their families to Stanford and the School of Medicine. While most schools herald the transition to medical school with a "white coat" ceremony, Stanford has been unique in providing a stethoscope to each student as an emblem and tool of the career on which they are about to embark. The concept of a Stethoscope Dinner is

attributed to Dr. Elliot Wolfe, the Director of the Office of Medical Student Professional Development, and I am personally grateful to the focus of this event since historically and to this day, the stethoscope has been used to connect physicians to their patients whereas the white coat, while symbolically significant, tends to create more of a distance and professional separation. The Ceremony was a true celebration of a new beginning for our students – and their families.

- **Blackhawk Event:** On Tuesday evening, September 24th I joined faculty of the Department of Urology for a special education event and reception at the Blackhawk Museum in Danville, CA. Sponsored by Mr. Kenneth Behring, currently Founder of the Wheelchair Foundation and founder of the Blackhawk Museum, the evening featured Dr. Linda Shortliffe, Professor and Chair of Department of Urology, who provided an overview of the field of urology to an audience of over 100 interested members of the community. Dr. Joe Presti, Associate Professor of Urology then gave an update on the screening and testing for prostate cancer and Dr. James Brooks presented an overview of preventive strategies as well as new approaches for diagnosing urological malignancies. The presentations were followed by a lively and informed discussion with a very interested and participative audience. This event helped us to bring an update on the important work going on at Stanford to the east bay community.
- **Addiction and the Brain.** In order to provide a better understanding of addiction, the Stanford Brain Research Center coordinated a program that attracted more than 400 participants to a symposium held in the Fairchild Auditorium on Friday, October 4th. The symposium was made possible through the generous support of Mr. T. Robert Burke and featured presentations by leading investigators in the field including Ting-Kai Li, who was recently named the new Director of the National Institute on Alcohol Abuse and Alcoholism. Special thanks for organizing this important event go to Professors Dick Tsien, Bill Mobley, Rob Malenka, Ben Barres and other members of the SBRC.

Future Events

- **How to be a Stanford Faculty Entrepreneur: Role Models and Resources:** I have been asked to let you know about special program exclusively for Stanford faculty members that focuses on the practical side of entrepreneurship at Stanford. The Stanford Office of Technology Licensing (OTL), the Stanford Technology Ventures Program (STVP), and Concept2Company (C2C) sponsor this event.

The program will be held on Wednesday, November 5th from 12:30-5:30 p.m. at the Arrillaga Alumni Center. The seminar will feature a welcome by Jim Plummer, Dean of the School of Engineering, and an interactive interview with John Hennessy, Stanford University President, both of whom are successful entrepreneurs.

This event is intended for Stanford faculty members who are interested in learning how to evaluate the commercial value of their academic research, how to work with the Stanford licensing office, and how to take advantage of all of the resources in the Silicon Valley community. Panels of industry experts and experienced entrepreneurs will provide a guide to resources available to prospective faculty entrepreneurs and advice from those who have traveled this path before. A reception will follow the formal program, providing an opportunity to talk informally with other faculty members and panelists.

To view the agenda, learn about the speakers and panelists, and to register for the conference, please visit: <http://sen.stanford.edu/senfacultyseminar/> Space is limited and registration is required. To register contact <http://sen.stanford.edu/senfacultyseminar/registration.fft>. If you have any questions, please contact Sally Hines at: sally.hines@stanford

- **Reception for New Faculty of Color:** On Monday, October 21st, Provost Etchemendy will host a reception to welcome new faculty members of color to the Stanford community. The reception will be held in the Stanford Faculty Club from 4:30-6:30 p.m. This event is the result of a coalition between the Committee on Black Performing Arts (CBPA) and other Ethnic Centers on campus. On behalf of Professor Elam and the Provost, I would like to extend an invitation to the School of Medicine faculty and community to attend this reception.
- **Invitation to Moonlighting:** Arghavan Salles, one of the newly elected members of SMSA, has extended an invitation to the faculty and staff of the School of Medicine to attend “Moonlighting” the medical school’s annual semi-formal dance on November 9th. It will be held in the Great American Music Hall in San Francisco from 9:00 p.m. – 1:00 a.m. Tickets are \$25 for students and \$40 for everyone else. The contact person for tickets and information is Gladys Martin – gladys.martin@stanford.edu. This is the first time that faculty and staff have been invited to this event and it is a lovely opportunity to develop new connections within our broader community. I want to thank SMSA for extending this invitation.
- **Etta Kalin Moskowitz Memorial Lecture:** Dr. Sanjiv Sam Gambhir, Director, Crump Institute for Molecular Imaging, UCLA School of Medicine, will be this year’s Memorial Lecturer. The title of his lecture is “Molecular Imaging in Animals and Humans: Opportunities for the Next Decade”. Dr. Gambhir’s lecture will be held on Thursday, November 21st at 5:30 p.m. in the Lucile Salter Packard Children’s Hospital Auditorium. A reception will follow in the lobby.

Announcements

- **Dr. Thomas M. Krummel**, Emile Holman Professor and Chair of the Department of Surgery, was recently inducted into the Halsted Society. This is one of the oldest and most prestigious surgical organizations in the country with

an active membership of only 75. He becomes the second Stanford Chair of Surgery, after Dr. Robert Chase, to be elected to this organization.

The Halsted Society was created in April 1923 and named after William Stewart Halsted, M.D. as it was felt that he had given the surgical profession a new philosophy and a basic scientific approach to surgery (Dr. Halsted had died just the year before on September 7, 1922).

Today the Halsted Society is a vigorous organization of professional men and women who support the purposes listed in Article II of the Society's constitution: to perpetuate the memory of Doctor William Stewart Halsted; to further the scientific principles and ideals for which he stood; to encourage exchange of ideas, free and informal discussion, and a spirit of sociability and good fellowship among its members.

- **Dr. Mark McClellan**, Associate Professor of Economics and of Medicine, has been nominated as Commissioner of the Food and Drug Administration by the Bush Administration. Dr. McClellan, a faculty member in the Department of Medicine and CHP/PCOR is currently on leave at the White House in order to fulfill this important duty. Dr. McClellan's nomination has already achieved broad bipartisan support recognizing his remarkable credentials and attributes for this most important position.
- **Terence A. Ketter, M.D.**, Chief, Bipolar Disorders Clinic, and Associate Professor of Psychiatry and Behavioral Sciences at Stanford School of Medicine has received the eighth annual Outstanding Faculty Physician Award for excellence in specialty care of students. The award was presented by the Vaden Health Center. Dr. Ketter's outstanding diagnostic skills and his expansive knowledge of psychopharmacology have made him an outstanding clinician and an invaluable consultant for CAPS staff. "His knowledgeable approach has enabled many Stanford students to continue their academic careers," said Dr. Alejandro Martinez, Director of Vaden's Counseling and Psychological Services.
- **Anna Dapelo-Garcia**, Business Operations Manager for Clinic Administration for Stanford Hospital and Clinics, was given the sixth annual Vaden Award for Exceptional Service in facilitating health care of Stanford students. These awards were presented at the annual fall seminar of Vaden staff on September 18, 2002. Dapelo-Garcia, a thirteen-year employee of Stanford, was honored for ensuring that the logistics of referrals between Vaden and Stanford Clinics proceed smoothly and in a timely manner. Jane Meier, Associate Director of Vaden, noted her recent key contribution dealing with changes in students' insurance coverage.

Vaden offers medical care, counseling and psychological services and health promotion services to 14,000 Stanford students and their spouses and domestic partners. By referral from Vaden, clinics at Stanford Medical Center had more than 2,000 visits last year by Stanford students.

Congratulations to all!

Dean's Newsletter

October 21, 2002

ACCESS: Safety and Accountability in Clinical Research

On Monday October 7th, ACCESS hosted an extremely well attended symposium on Safety and Accountability in Clinical Research at Stanford. Given the enormous attention that has been focused in the press and by communities nationally on the conduct of clinical research, it is imperative that leading academic medical centers like Stanford critically review their programs and performance to assure that patient safety and the public trust is assured. Thankfully, Stanford has taken these matters very seriously and has done an outstanding job in this important but challenging area. This is especially important given the School's commitment to research and the affirmation, through our ongoing Strategic Planning Process, that translational clinical research is one of our highest priorities in the years ahead, serving as a means to bring knowledge from the laboratory to the bedside and as a vehicle to align our basic and clinical research students and faculty.

This year's Keynote Symposium Speaker was Greg Koski, MD, PhD, who has served as Director of the Office for Human Research Protection in the Department of Health and Human Services since September of 2000*. Dr. Koski reviewed the progress that he observed taking place throughout the nation as academic medical centers have responded to the public concern about human subject safety in clinical research. He also cited Stanford as a leader and pacesetter in working diligently to assure human subject safety in clinical research.

Symposium participants, together with faculty panels, reviewed three mock cases to discuss issues in the recruitment of subjects to clinical trials, the informed consent process, conflicts of interest, the role of the Institutional Review Board, and the importance of assuring patient privacy as well as creating an environment of safety and accountability. Special thanks go to Dr. Steve Alexander, Professor of Pediatrics (Nephrology) and Medical Director of the ACCESS Clinical Trials Office and Mary Sweeney, Program Manager, along with the Planning Committee, for putting together an excellent program.

*Of note, Dr. Koski resigned from position of Director of OHRP on October 16th.

"Bench-Side" Consults

We generally tend to think of consultations regarding biomedical ethics as taking place in the hospitals or related medical settings. However, they are also very important in the research laboratory. Dr. Hank Greely, C. Wendell and Edith M. Carls Smith Professor in

Law and current chair of the University Academic Council, has provided the following update. According to Professor Greely, “not everyone knows...that, like the Medical School itself, the Bioethics Center has a dual focus, working on both clinical medicine and basic biomedical science. The Center has provided ethics consultations not just to clinicians, but to basic science researchers whose projects raise ethical concerns. The Center's monthly seminar this past October 3rd provided a nice example. Professor Hank Greely from the Law School presented the preliminary report of a five person working group assembled by the Center to consider the ethical implications of some of Dr. Irv Weissman's work with human brain stem cells. Dr. Weissman wants to try to create mice with brains made up, largely or entirely, of human neurons in order to have an *in vivo* model for studying those neurons and their reactions to both insults and treatments. The group's report tries to provide clarity and guidance about the issues this research raises, both for Dr. Weissman and for others, including the public. The Center wants to provide more help to basic science researchers, whether through published reports by working groups or through short telephone or e-mail communications.

More About the Respectful Workplace

I have conveyed in past Newsletters the importance I place on having a “respectful workplace” within the School of Medicine. A number of initiatives are in place to educate and assist students, faculty and staff and it is our hope that these will help to assure that all members of our community feel valued and respected but, if they have concerns, that they know where to go for help and assistance.

At the Dean's Staff Meeting on Wednesday, October 9th, Martha McKee reviewed her role as the Ombudsperson for the School. She also described other resources available within the medical community. She highlighted that the Ombudsperson must be both impartial and independent and assures confidentiality in all interactions. The Ombudsperson is available to listen to concerns, clarify procedures and suggest options. The mission of the Ombudsperson's Office is to consider the rights and interests of individuals but not to advocate for any individual or group but rather, to advocate for fairness and equal treatment. You should feel free to contact the Ombudsperson when you need someone to listen; when an awkward situation occurs in the workplace or uncomfortable feelings are bothering you; when you are unsure of Stanford policy or you believe a policy, procedure or regulation has been improperly applied; when you think you have been treated unfairly; when you think that someone has engaged in misconduct or what you think may be an ethical violation; when you believe you are being harassed; or when you are afraid of retaliation. The services of the Ombudsperson are available at Stanford to be a resource for faculty, students, staff, housestaff and postdoctoral fellows in the School of Medicine. If you need assistance contact Ms. Martha McKee at 650-498-5744 or by email at Martha.Mckee@leland.stanford.edu.

In addition to the Ombudsperson, the School of Medicine has other resources for problem resolution. Please note the following:

Medical Students

Julie Parsonnet, MD, Senior Associate Dean for Medical Education

Eleanor Antonakos, DFA/Office of Student Affairs

Interns and Residents

Ann Dohn, Office of Graduate Medical Education

Graduate Students

Ellen Porzig, PhD, Associate Dean for Graduate Student Affairs
W. James Nelson, PhD, Senior Associate Dean for Graduate and
Postdoctoral Education.

Postdoctoral Scholars

Michael Cowan, Associate Dean for Postdoctoral Affairs

Staff/Staff Physicians

Cori Bossenberry, Director, Human Resources Group
Norma Leavitt, Associate Director, Human Resources Group

Faculty

David Stevenson, Senior Associate Dean for Academic Affairs
Linda Deasey, Assistant Dean for Academic Affairs
Ellen Waxman, Director of Faculty Relations

Again, these resources are available to help us achieve the most respectful workplace that is possible.

Board of Trustees Update on the Clark Center

At the Committee on the Medical Center of the Stanford University Board of Trustees, Matt Scott, Professor of Developmental Biology and Genetics and Chair of the Bio-X Leadership Council, gave an update on “Interdisciplinary Research in Biology” also known as the Bio-X Program. The goals of Bio-X are to foster interdisciplinary education for a new generation of students, facilitate innovative collaborations among scientists and physicians across the spectrum of the physical, engineering, biological and social sciences, and provide bridges to the community through education and concerns for public policy and ethics. To accomplish these objectives, the Bio-X program will:

- Design events and programs that foster discussion and collaboration across the boundaries of traditional fields.
- Offer programs and incentives (e.g., grants) to stimulate collaboration of teams with diverse backgrounds.
- Build an intranet to facilitate communication between Bio-X affiliates across the Stanford campus.
- Generate a planning process for interdisciplinary education.

Among the current themes of Bio-X at Stanford are:

- Biocomputation (including imaging, bioinformatics, protein folding, biomechanical stimulation)
- Biodesign (including biorobotics, device discovery)
- Biophysics
- Chemical Biology
- Genomics/Proteomics
- Regenerative Medicine

Bio-X at Stanford has unfolded as a program that now engages four Schools (Earth Sciences, Engineering, Humanities & Sciences, and Medicine) and with more than 20 departments now participating. The Clark Center will house part of the Bio-X program when it opens in June, 2003. To date, 31 faculty are planning on locating some or all of their laboratories to the Clark Center. When assembled, they will include a breathtaking array of faculty disciplines, as well as both senior and junior members, a third of which are Assistant Professors. In addition, the Clark Center will be the administrative home of the newly established Department of Bioengineering between the Schools of Engineering and Medicine, whose mission is “Create a fusion of engineering and the life sciences that promotes scientific discovery and the development of new technologies and therapies”.

The emerging themes in multidisciplinary research and education at Stanford are exciting and important and are likely to distinguish our university as a unique and very special institution during the years ahead.

Faculty Senate Update on Curriculum Planning

As you know, under the leadership of Senior Associate Dean for Medical Education Julie Parsonnet, we are engaged in curriculum redevelopment for medical students with the goal of instituting important new changes for the Class entering in 2003. One of the overarching goals includes fostering parallel learning throughout the medical school in both basic science and clinical medicine in order to foster continued connectivity with the scientific principles that are the foundations of modern clinical medicine and clinical practice. In addition, we want our students to be able to pursue independent scholarship throughout medical school through “scholarly tracks” (or medical majors) that will enable them to develop specific skills through a mentored curriculum with associated research. In order to accomplish these and related goals, it is also important to critically assess the fundamental essential knowledge that students must gather early in medical school in order to prepare them for life-time learning. Rather than adhering to the more traditional and compartmentalized medical school curriculum of “preclinical” followed by “clinical” training, we would like to find greater linearity and connectivity to both areas of learning. To accomplish this and also create opportunities to commence the “scholarly track” experience during the first year of medical school, it is important to reduce class time during the initial phases of medical school – some of which will be moved to later years of medical training. These changes are, of course, all interrelated and must be further guided by assuring that our students still have an environment that fosters flexibility and individual development. Such changes quite naturally foster both excitement and concern.

In order to benefit from the experiences of other institutions that have recently undergone curriculum change, the Medical School Faculty Senate invited David Irby, Ph.D., Senior Associate Dean for Education and Helen Loeser, M.D., Associate Dean for the

Curriculum from UCSF to speak at its October 16th meeting. Drs. Irby and Loeser shared the challenges they faced in instituting the major changes under way at UCSF. One guiding principle is that the changes are continuous and require ongoing adaptation. The second is that there is always resistance to change, regardless of the nature of the change or the portion of the curriculum being modified. The third is that faculty and student engagement is critical and that a clear mandate from School leadership essential.

I am cognizant that change is difficult and that there are many stakeholders, each with an important perspective. That said, we agreed through the Strategic Planning process that began more than a year ago that the general directions outlined above were essential to the future of Stanford Medicine. I am absolutely and unequivocally committed to having these changes occur in a timely manner. I am confident that the guiding principles that will shape these changes discussed above will enrich the opportunities for our students and make education at Stanford transformational in American Medicine for the 21st Century.

Update from the Executive Committee

At the Executive Committee meeting on Friday October 18th, the changes that are now planned for the professorate were reviewed and discussed. These changes are the result of a more than yearlong planning effort led by Senior Associate Dean for Academic Affairs, Dr. David Stevenson. I will present an update about the changes in the next scheduled issue of the Dean's Newsletter on November 4th.

Among the other topics discussed at the Executive Committee were:

Working with the Office of Communications and Public Affairs. A presentation was given by Ritch Eich, Chief and Michelle Brandt who described the role of their Office in linking the faculty with the media. A strong plea was made to the Chairs that they and the faculty get to know and work with the Office of Communications and Public Affairs and that they should feel free to call (650-723-6911) whenever there are questions or concerns. Specifically, the Office can help faculty with:

- Counsel in responding to requests for interviews from print and broadcast reporters – including media training.
- The Office can help disseminate information that features important faculty stories and events.
- They can prepare response to sensitive and potentially negative information.
- Facilitate broadcast of photo shoots within the medical center.

Dr. Eich and Ms. Brandt also made clear that faculty could help them by:

- Contacting their office with ideas for the Stanford Report and press releases
- Providing notice (ideally two weeks) about publications that may be newsworthy.
- Alerting them to events or issues that may generate media interest.
- Letting them know if a reporter contacts you.

I would encourage you to work closely with the Office of Communications and Public Affairs – and to certainly contact them if you have any questions or need advice.

Health Insurance Benefits: We had a presentation regarding the upcoming open enrollment and the various changes in health care coverage. As you likely know, health care inflation is occurring nationally – and locally – with increases in rates exceeding 25-30%. These and other changes are impacting the choices available for Stanford University employees. You should have received information about the options and if you have questions you should contact the Benefits Office at 650-736-2985 or visit the website at <http://benefitsu.stanford.edu/>

It is important to note that if you want to have full access to Stanford faculty the options are restricted to the Blue Shield PPO and the Definity Plan. Access to Stanford physicians may be also available the Blue Shield Triple Option. Please also note that the options are different for Postdoctoral Scholars and their questions can be directed to Michael Cowan, Associate Dean for Postdoctoral Affairs at 650-725-5075.

Congratulations

On October 14th, the Institute of Medicine of the National Academy of Sciences announced its newly elected members. Included among them were **Dr. Linda Giudice**, Stanley McCormick Memorial Professor of Obstetrics and Gynecology and **Dr. Irv Weissman**, Karel and Avice Beekhuis Professor of Cancer Biology, Professor of Pathology, Developmental Biology and by courtesy, of Biological Sciences. This brings the number of Stanford faculty elected to the IOM to 36. Congratulations to Drs. Giudice and Weissman.

Mr. Mike Hindery announced that **Carole Buffum** has been appointed as Assistant Dean for Finance and Administration in the School of Medicine. Carole has served for four years as the School's Executive Director of Finance and Administration and before that served in several finance and management roles in the Dean's Office. Although Carole's role and responsibilities are not changing, the new title is appropriate recognition for Carole's role and responsibilities in and contributions to the School. Congratulations Carol.

Dr. David Spiegel was formally celebrated as the Jack, Samuel and Lulu Willson Professor at a lovely dinner held in his honor on October 8th. This offered an opportunity to acknowledge Dr. Spiegel's many contributions to both scholarship

in mind/body interactions and resultant important programs for patients facing the challenges of cancer or stressful life situations or events. He is internationally recognized for his important contributions to psychiatry and he is the recipient of numerous honors and awards.

Dr. Malcom Bagshaw, Henry Kaplan-Harry Lebeson Professor of Cancer Biology, Emeritus was awarded the Gold Medal of the American College of Radiology at its 79th Annual Meeting on October 1. He was recognized for his contributions to the field of radiology, especially the development of concepts for the treatment of prostate cancer.

Dr. Ted Harris, George DeForest Barnett Professor of Medicine and past Chair has been elected to Fellowship in the Royal College of Physicians of London. Congratulations to Dr. Harris

On Friday, October 18th, a wonderful event was held in the Bing Dining Room to celebrate the career of **Dr. Harry Oberhelman, Jr.**, Professor of Gastrointestinal Surgery, Emeritus. Dr. Oberhelman has been a major figure at Stanford for more than 42 years, having joined the faculty within a year of the School moving to the Palo Alto campus. Since then he has been a distinguished and revered surgeon and colleague who is deeply respected for his many contributions to patients, trainees and Stanford.

Upcoming Events

Walk for Diabetes. On Sunday, October 27th, Stanford Medical School students, along with others from the University and neighborhood communities will participate in the “Walk to Cure Diabetes” that will be held in Shoreline Park in Mountain View, beginning at 9AM (with registration beginning at 8:00 a.m. Our students invite you to join the Stanford School of Medicine Team and, by your participation, help in supporting research in diabetes. (The walk is only three miles).

The Fall Forum on Community Scholarship and Service, organized by Stanford Medical Students and sponsored by the Public Service Medical Scholars Program, will be held on Wednesday, November 6th, from 5:00-7:30 p.m. at the Frances C. Arrillaga Alumni Center. Dr. Robert Ross, CEO of the California Endowment will give the keynote address. This first-time event will showcase a wide range of service and partnership research projects undertaken by Stanford medical students in underserved communities here and around the world. If you have any questions please contact schevez@stanford.edu or call 650-736-1957 and if you are planning to attend, please RSVP to stanfordfallforum@yahoo.com or 650-736-1957.

Appointments and Promotions

Richard Bland has been appointed Professor of Pediatrics (Research), 11/01/02-10/31/08.

Joan Frisoli has been appointed Assistant Professor of Radiology at the Stanford University Medical Center, 10/1/2002 to 9/30/2005

Thomas Hsu has been appointed Assistant Professor of Urology at the Stanford University Medical Center, 11/1/2002 to 10/31/2005

Mark Musen has been promoted to Professor of Medicine (Medical Informatics) and, by courtesy, of Computer Science, effective 11/01/01.

Lawrence Shuer has been promoted to Professor of Neurosurgery at Stanford University Medical Center, effective 11/1/02.

Dean's Newsletter November 4, 2002

Important Evolution of the Appointment and Promotion Process

One of the nine Work Groups taking part in the School of Medicine's Strategic Planning process that began in September 2001 focused on the Professoriate and was led by Dr. David Stevenson, Senior Associate Dean for Academic Affairs and the Harold K. Faber Professor of Pediatrics. The major goal of the Work Group on the Professoriate was to recognize the important missions of the School of Medicine in education, research and clinical care and to seek ways of aligning faculty development and promotion to these essential roles. The dominant focus of the Work Group was on the appointments and promotions of clinical faculty. While there was a time when every clinical faculty member was expected to excel in each of these missions it is widely now recognized that the demands and expectations of a career in clinical medicine or in research requires a more singular focus. At the same time, it is expected that all faculty members in the School of Medicine should contribute to education. Dr. Stevenson and his colleagues recently completed their work, and I am pleased to announce the results of their efforts. The revisions discussed here are effective November 1, 2002.

Background and History

The changes that are forthcoming represent an evolution and are best framed within a historical context. Until 1989, Stanford faculty in the School of Medicine held Academic Council appointments in the "University Tenure Line (UTL)" or in the "Non-Tenure Line" in the areas of, teaching, research or clinical care (NTL[T], NTL[R] or NTL[C]). In 1989 a new faculty line, the Medical Center Line (MCL), was established by the

University. The new line was the result of a School of Medicine committee chaired by Dr. Saul Rosenberg, Maureen Lyles D'Ambrogio Professor of Medicine and Radiation Oncology, Emeritus. The driving rationale for creating the MCL was to help meet the increasing needs of the Medical Center to fulfill vital patient care and teaching needs. Although MCL faculty are members of the Professoriate and are eligible for housing, tuition and related benefits, they are not members of the Academic Council and can serve as the principal investigator of a research project only with a waiver. Further, their academic titles are associated with the respective affiliated hospitals (e.g., Stanford Hospital & Clinics [SHC], Lucile Packard Children's Hospital [LPCH], Palo Alto VA Medical Center [PVAMC], Santa Clara Valley Medical Center [SCVMC]) and do not carry tenure. That said, appointments at the rank of professor beyond the initial appointment, which is for a term of years, confer "continuing terms of appointment," which afford significant security.

During the past decade, the number of MCL faculty members has increased nearly exponentially, both to meet the expanding clinical needs of the clinical departments and hospitals and because of the relative limitations of appointing clinical faculty to UTL positions, especially during the early to mid 1990's. As of October 28, there were approximately 333 members appointed in the MCL, all of these appointments having transpired during the past decade. In contrast, as of the same date, there are 310 UTL in the School of Medicine, 88 in basic science departments and 222 in clinical departments.

During the past 10-12 years, there have been continuing changes in the composition and functions performed by "MCL" faculty. Most notably, an increasing number of our MCL faculty are now engaged in research (both wet and dry laboratory as well as clinical trials) and about 40% have achieved external peer-reviewed funding. In some cases, the distinctions between the research contributions of MCL and UTL faculty have become blurred. At the same time, there is also wide disparity in the written scholarly contributions of MCL faculty as a whole, in part because the expectations for such have themselves evolved. Furthermore, departments have had varying expectations for MCL faculty, in part because of innate differences among clinical specialties. Moreover, despite the progress that has been made in recognizing the critically important role of the MCL faculty in the School, since my arrival in April 2001, I have heard from many MCL faculty members that they still feel like "second class citizens" within the University. I certainly do not agree with that perception, and I believe that the MCL faculty is an essential and enormously valuable component of the professoriate.

In addition to the UTL, Non-Tenure-Line, and MCL faculty, there are two other groups who are extremely important to the patient care success of the Medical Center and the teaching mission of the School. First are "staff physicians," who are appointed within departments on fixed terms to carry out critical patient care responsibilities. They are regular university staff and are not members of the professoriate. They are currently appointed as members of the "Voluntary Clinical Faculty (VCF)." Their numbers vary across clinical departments but in the aggregate, there are now over 300 staff physicians, although a number of these are part-time appointments. In addition to the important role that staff physicians play in the delivery of patient care, many are also intimately

involved in teaching students and trainees, and a number of them have been highly lauded as among our most valued clinical teachers.

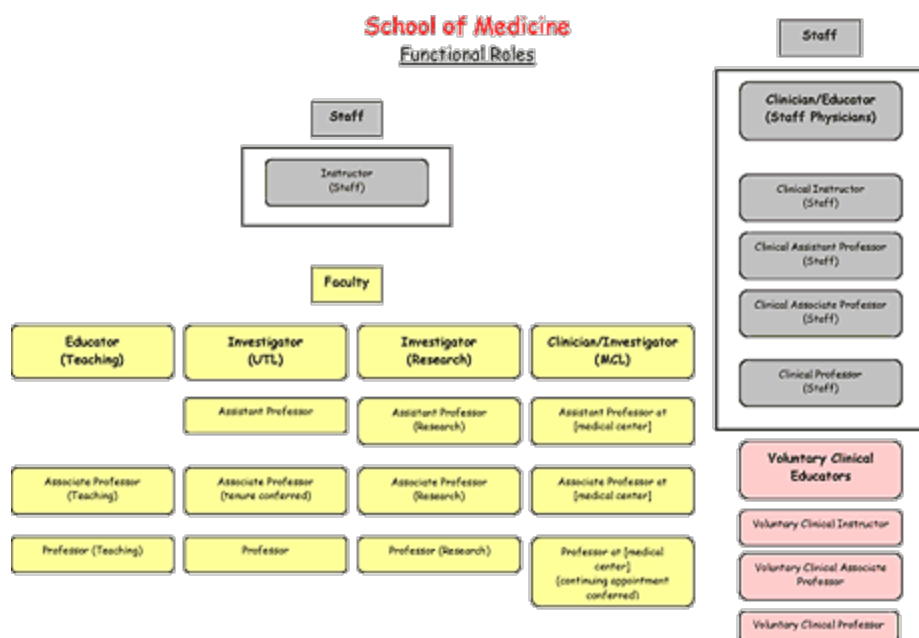

The final group is comprised of community physicians who either practice at Stanford Hospitals or who teach medical students and trainees in their offices or at affiliated hospitals. This group has been referred to as “Voluntary Clinical Faculty.” The VCF have been appointed by clinical departments and have been expected to provide at least 100 hours of teaching per year. While we welcome, value, and benefit from community physician colleagues who contribute to our teaching mission, it must be noted that the number of individuals in the VCF has expanded over the years, reaching in excess of 1500 just over a year ago; there are currently approximately 1035 members. While recognizing their value, I must also point out that the criteria for appointment and promotion of VCF have been without academic criteria; advancement from voluntary clinical assistant to associate to full professor has been based on length of service rather than evidence of scholarship or an evaluation of teaching performance. This represents a point of confusion both within the School and Medical Center as well as to our community of patients and colleagues locally and nationally.

Process for Change and Evolution

The major focus of the Work Group on the Professoriate chaired by Dr. David Stevenson was to address the current and future status of the MCL faculty, Staff Physicians and Voluntary Clinical Faculty. To accomplish this, two subcommittees were appointed, one focusing on the MCL faculty and the second on Staff Physicians, community physicians and the VCF. Both of these subcommittees were chaired by Dr. Maurice Druzin, Associate Dean for Academic Affairs and the Charles B. and Ann L. Johnson Professor of Obstetrics & Gynecology. Both subcommittees had broad representation, including UTL, MCL, Staff Physician and community physician VCF members. The subcommittees worked diligently during the past year and presented updates to the Medical School Executive Committee, Faculty Senate, the Strategic Planning Retreat and, during this past summer, to the Provost. Because the recommendations that were proposed to the Provost represent evolution and clarification, they do not constitute changes requiring review by the Senate of the Academic Council. At the same time, it was imperative that the recommendations have the support of the Provost and his advisory group. Not only did the Provost endorse the Schools recommendations, he also helped to clarify and improve a number of them. Accordingly, these changes became effective November 1, 2002.

A General Framework

Based on the issues and challenges described above, our overarching goal has been to develop and clarify our faculty and physician lines to better make sense in the current era and to better align available career paths to the functions carried out by faculty and physicians. To this end, we have devised a framework that encompasses all of our lines. Within this general framework we have made the specific revisions in the MCL, the staff physician, and the VCF categories that are described below.

The general framework is illustrated in the shown above. It consists of four groupings. The first is the faculty, which consists of the Academic Council and Medical Center Line. We have further designated the ranks within these two groups using the following names: the UTL and Non-Tenure-Line faculty are designated as Investigators, the Non-Tenure-Line Teaching faculty as Educators, and the MCL faculty as Clinician/Investigators. The purpose of these names is to highlight the distinguishing, core functions of the members of these groups; they are not meant to imply that members of a particular group do not engage in the activities of the other groups. For instance, faculty in all of these groups are engaged in the teaching enterprise.

The second and third groups are regular staff groups. One is the staff physician group, which we have designated Clinician/Educators, and the other is a new staff rank of Instructor. The fourth group, previously known as the Voluntary Clinical Faculty, has been given the new designation of Voluntary Clinical Educators.

Revisions in the MCL, Staff Physician, and VCF Lines

1. Designation of Medical Center Line faculty as Clinician/Investigators

Given the increasing role of MCL faculty during the past decade in clinical research and the mission of the School to promote translational research in medicine, this group of faculty is optimally poised to carry out these important functions. The new Clinician/Investigator designation is meant to highlight the research role of MCL faculty and to incorporate it into the criteria for appointment, reappointment, and promotion. MCL faculty will be expected to participate in clinical research and to produce written scholarship. The revised criteria for appointment, reappointment, and promotion, which make this expectation clear, will be available in the Faculty Handbook (www.med.stanford.edu/academicaffairs/handbook) in the near future.

We recognize that some current members of the MCL faculty may have entered their present positions with a somewhat different understanding of the criteria for scholarly productivity. For such individuals, the School and the Provost are prepared to consider extensions of appointment prior to the reappointment or promotion review to allow the opportunity for additional scholarly work. Faculty who believe they may fall into this group should be in touch with their department chairs. Requests for extensions of appointment will be considered on a case-by-case basis. The revised criteria apply immediately to all faculty appointed on or after November 1, 2002. They will be implemented for all current faculty over the next several years.

In the context of the new Clinical/Investigator designation, Dr. Stevenson and I have undertaken efforts to review the rights of PI-ship for MCL faculty. During this past year, we have achieved the ability to grant a “blanket waiver” for MCL faculty for research being conducted in the same general area. We are currently working with the Provost and the Committee on Research of the University Faculty Senate to pursue this important query.

We are also examining the role that MCL faculty have at different affiliated hospitals as well as the differences in rewards and benefits that may apply in different settings.

2. Designation of Staff Physicians as Clinician/Educators.

Recognizing the important role that Staff Physicians play in the delivery of patient care and to the education of medical students and trainees, we are seeking ways to better affirm the contributions these physicians make to our clinical care and education missions. The new designation of Clinician/Educator is meant to recognize these roles and provide a more meaningful career path for these individuals at Stanford. Because Staff Physicians are University staff, employed by clinical departments, they will no longer carry the term “voluntary” as an appellation to their academic title. Rather, they will be referred to as “clinical assistant, associate or full professors” based on their performance and contributions.

Written scholarship will **not** be required for promotion in the Clinician/Educator line. Individuals in this line can be reappointed for repetitive terms. We will also entertain the transfer of current MCL members to the Clinician/Educator line if they feel that the functional criteria are more appropriate for the activities they are carrying out. Because we recognize that this line does not currently carry housing benefits (but, does, as a category of regular staff positions, carry eligibility for the tuition grant program according to the University’s policies about this program) we are working with Hospital leaders to address this matter and are hopeful that a resolution will be achieved.

3. Designation of the prior Voluntary Clinical Faculty as Voluntary Clinical Educators

The respected and valued role of community physicians emanates from their collegiality and from the educational contributions they can offer to students and trainees based on their knowledge and experience. Accordingly, this is not a formal faculty line per se but a means of acknowledging and rewarding community physicians who volunteer their time to advance the School and Medical Center's education mission. The new designation of this group as Voluntary Clinical Educators is meant to recognize this important role.

Because changes were anticipated in the VCF, all new appointments were put on hold last year and all current members were extended for a year. This extension was reinstated in September of 2002 and extends through August 31, 2003. During this time, all community physicians who do not have current appointments in the previously designated VCF and who wish to have an appointment as a Voluntary Clinical Educator (VCE) must apply to the department chair. Those who do hold current appointments in the previously designated VCF will be grandfathered into the Voluntary Clinical Educator group and sustained at their current ranks with the requirement to add the word "Voluntary" to all titles and with evidence of continued service meeting the department's criteria for continued appointment.

The initial appointment in the VCE will henceforth be at the rank of "Voluntary Clinical Instructor." These appointments will be made by the clinical departments and will be based on criteria and procedures developed jointly by the department and the School. However, all other appointments and all promotions will require a review by a School-wide Voluntary Clinical Educator Committee. In addition, the rank of "Voluntary Clinical Assistant Professor" has been eliminated for new appointments.

As has been the case, in addition to being a physician in good standing who actively admits patients to Stanford Hospital & Clinics or Lucile Packard Children's Hospital or as a staff member at a major affiliate (Palo Alto VA Medical Center or Santa Clara Valley Medical Center), members of the VCE will need to make a commitment to engage in at least 100 hours of teaching annually. We recognize that this is a significant commitment for individuals who are very busy with full-time patient care responsibilities, and we deeply appreciate their generosity.

Importantly, all individuals must use the term "Voluntary" affixed to their title in order to make clear that they are volunteering their time and that they are not employed by the University and/or the Medical School

I want to underscore how much we value our community physician colleagues and how much we hope that these revisions will clarify and convey the value of an appointment as a Voluntary Clinical Educator.

Establishment of the Instructor Position

In order to smooth the transition from training to a path that leads to a faculty career in academic medicine we are introducing the title of Instructor. This is a regular University staff position. We envision that it will largely apply to individuals who are completing their clinical training and who may be candidates for “K awards”. The Instructor position will permit individuals to complete their training, assume where appropriate PI-ship, and compete for junior faculty positions at academic medical centers nation-wide.

I want to thank the many individuals who have worked hard to bring these important evolutionary changes to fruition. In particular, my thanks go to Drs. David Stevenson and Maurice Druzin along with Mrs. Linda McLaughlin. I also want to acknowledge the important input that we received from the Executive Committee, Faculty Senate, and Provost’s Office. It is important to note, of course, that these changes are aimed at making the process of appointment and promotion as fair and clear as possible and that this is a work in progress, with additional changes surely to follow in the months and years ahead.

Update on the Hiring Freeze

By now you have surely heard about the announcement of the Hiring Freeze at Stanford University that was recently announced by Provost John Etchemendy ([link to Stanford Report Oct 30th](#)). This is a University-wide mandate and thus includes the School of Medicine. Although we are cognizant of the potential impact of a hiring freeze we remain very optimistic that the School will sustain the progress we have been making and meet our important goals and objectives, especially those related to the School of Medicine Strategic Plan. Although the School of Medicine has had a number of challenges during the past years, and while we share the same concerns as the University regarding future forecasts based on the current economy, we have been managing our finances in very thoughtful, planned ways. That said, we believe that the University-directed hiring freeze provides us with an opportunity to review various personnel positions and determine if we might be able to save on expenses by doing things differently.

I wanted to update you on the way we will be handling the review of positions and requests within the School of Medicine. It is important to remember that this process applies to all positions, regardless of the source of funding. We have recently distributed to department chairs and DFAs the materials that must be completed to request an exemption to the freeze. These requests will be reviewed at least twice per week by a group led by Mr. Mike Hindery, Senior Associate Dean for Finance and Administration, that includes Ms. Cori Bossenberry, Director of Human Resources, Carole Buffum, Assistant Dean for Finance and Administration and Perry Everett, Controller. This group will determine whether the positions being requested are critical to the missions of the School and whether there might opportunities to do things differently, or more collaboratively. The criteria that will be used include the source of funding, the function

served, and the financial and staffing conditions of the unit requesting the position. Once this review has been completed, the recommendations will be forwarded to the Dean for a decision based on the process established by the Provost.

We recognize that this process will delay the posting of positions for several days. However we believe it will provide the most effective way of carrying out this process. Naturally, based on the experience that is gained, we will seek ways to further streamline the steps involved as this process continues.

We also recognize that while the announcement of a hiring freeze is not without significance and consequences, we remain optimistic that the University and we will remain successful in meeting our programmatic and mission-based objectives that our so vital to our collective future.

Updated Statement On Sexual Harassment at Stanford University

During the past week, an updated statement on sexual harassment has been circulated that addresses consensual relationships. As you know, I have underscored in previous communications and actions that a “respectful workplace” is one of my highest priorities. Accordingly, I am taking the liberty of reprinting the Statement from the University below:

CONSENSUAL SEXUAL OR ROMANTIC RELATIONSHIPS: 2002 Revision

- ***In General*** - There are special risks in any sexual or romantic relationship between individuals in inherently unequal positions, and parties in such a relationship assume those risks. In the University context, such positions include (but are not limited to) teacher and student, supervisor and employee, senior faculty and junior faculty, mentor and trainee, adviser and advisee, teaching assistant and student, coach and athlete, and the individuals who supervise the day-to-day student living environment and student residents. Because of the potential for conflict of interest, exploitation, favoritism, and bias, such relationships may undermine the real or perceived integrity of the supervision and evaluation provided, and the trust inherent particularly in the teacher-student context. They may, moreover, be less consensual than the individual whose position confers power or authority believes. The relationship is likely to be perceived in different ways by each of the parties to it, especially in retrospect.

Moreover, such relationships may harm or injure others in the academic or work environment. Relationships in which one party is in a position to review the work or influence the career of the other may provide grounds for complaint by third parties when that relationship gives undue access or advantage, restricts opportunities, or creates a perception of these problems. Furthermore, circumstances may change, and conduct that was previously welcome may become unwelcome. Even when both parties have consented at the outset to a

romantic involvement, this past consent does not remove grounds for a charge based upon subsequent unwelcome conduct.

Where such a relationship exists, the person in the position of greater authority or power will bear the primary burden of accountability, and must ensure that he or she - and this is particularly important for teachers - does not exercise any supervisory or evaluative function over the other person in the relationship. Where such recusal is required, the recusing party must also notify his or her supervisor, department chair or dean, so that such chair, dean or supervisor can exercise his or her responsibility to evaluate the adequacy of the alternative supervisory or evaluative arrangements to be put in place. Staff members may notify their local human resources officers. To reiterate, the responsibility for recusal and notification rests with the person in the position of greater authority or power. Failure to comply with these recusal and notification requirements is a violation of this policy, and therefore grounds for discipline.

- ***With Students*** - At a university, the role of the teacher is multifaceted, including serving as intellectual guide, counselor, mentor and advisor; the teacher's influence and authority extend far beyond the classroom. Consequently and as a general proposition, the University believes that a sexual or romantic relationship between a teacher and a student, even where consensual and whether or not the student would otherwise be subject to supervision or evaluation by the teacher, is inconsistent with the proper role of the teacher, and should be avoided. The University therefore very strongly discourages such relationships.

If you would like additional information, please review "Understanding Stanford's Policy on Sexual Harassment and Consensual Relationships" or at: <http://harass.stanford.edu>. In addition, if you feel you need advice or personal consultation, please feel free any of the individuals listed in the October 21st issue of the Dean's Newsletter.

Stanford Medical Alumni Association

The Stanford Medical Alumni Association (SMAA) was founded in November 1932 in San Francisco and extended membership to all graduates of Cooper Medical College (which became enjoined with Stanford in 1908) and Stanford Medical School. In 1950 the SMAA became incorporated as a non-profit organization and subsequent evaluations of the role of the Alumni Association led, in 1996-1997, to a restructuring led by the then Dean Gene Bauer. That resulted in the current close association of SMAA with the Office of Medical Development (OMD) and a strengthening of the role of the Associate Dean for Alumni Affairs that is now so ably held by Dr. Ross Bright. At the same time, the SMAA and its governing board maintains direct oversight over the programs and funds for alumni outreach as well as for a number of vitally important programs that support our students today. We are also fortunate in having very engaged officers elected to leadership in SMAA and I have benefited, since my arrival, from the efforts of Dr. Joshua Prager and, most recently, Dr. Newton Harband.

The SMAA long played an important and vital role in supporting students. In 1965, the SMAA was instrumental in establishing an endowment fund to support medical students that, by 1975 was focused on scholarship and loan programs. In 1980, the SMAA played a major role in the creation of the Medical Student Scholars Program. Both of these areas of support have had a major impact on the success of Stanford Medical School today.

Today, SMAA supports a number of the most important activities for introducing our medical students to Stanford and for welcoming them back once they leave. Included among these are:

- The Stethoscope Dinner (in conjunction with the Office of Student Affairs).
- Match Day Ceremony
- Medical School Graduation Picnic
- Health Careers Opportunity Program (HCOP) graduation event.
- Reunion Weekend, which includes special symposia, Reunion Dinners, the Annual JE Wallace Sterling Award Event and more.
- “On the Road” series, during which SMAA leadership, the Dean and others visit with alumni in various cities to inform them about the exciting events and happenings taking place at Stanford.

Clearly, the SMAA plays a vital and important role in the life of Stanford students and alumni. In order to provide greater connectivity of alumni to the activities on the campus, a new Website has been created that will bring news of events to our graduates in a timely way. You can access the website <http://www-med.stanford.edu/alumni/>. In addition to bringing information to our alumni, we are extremely eager to have input, comments and suggestions from our alumni – and I hope we will hear from you (or them) very often.

Important Upcoming Events

- ***This Wednesday, November 6th, will be the First Fall Forum on Community Scholarship and Service and will be held at the Arrillaga Alumni Center from 5:00 – 7:30 pm.*** This important event will feature poster and oral presentations by students and a keynote address by Dr. Robert Ross, President and CEO of the California Endowment. Please make every effort to attend.
- ***Mark your calendar for December 6th at 4:30 pm in the Fairchild Auditorium.*** **Dr. Freeman Hrabowski, III**, President of the University of Maryland, Baltimore County will give the first annual symposium on diversity in graduate education. Dr. Hrabowski is a scholar and educator who has won national recognition for his work on increasing minority participation in math and the sciences. For additional information please contact Kimberly Griffin at kgriffin@stanford.edu or at 724-2815.

Recognition

The recent Infectious Disease Society of America meetings in Chicago featured work from a number of Stanford faculty but two individuals deserve special recognition. **Dr.**

David Relman, Associate Professor of Medicine gave a wonderful special plenary presentation on “Infectious Diseases in the 21st Century: The ‘Omics’ Revolution is Coming”. In addition, **Dr. Ann Arvin**, Lucile Salter Packard Professor of Pediatrics and Professor of Microbiology and Immunology, Chief of the Division of Pediatric Infectious Diseases and Associate Dean of Research at Stanford University was the recipient of the prestigious John F. Enders Award and delivered a wonderful lecture on “Varicella-Zoster Virus Infections: Genetic Ingenuity encounters the Human Host.”

Appointments and Promotions

Jeffrey Axelrod has been reappointed as Assistant Professor of Pathology at the Stanford University Medical Center from 12/1/2002 to 2/28/2005.

Barry Behr has been reappointed as Assistant Professor of Obstetrics and Gynecology (Reproductive Endocrinology and Infertility) at the Stanford University Medical Center from 11/1/2002 to 7/31/2006

Sung Chun has been reappointed as Assistant Professor of Medicine (Cardiovascular Medicine) at the Stanford University Medical Center from 11/1/2002 to 8/31/2006.

Jessica Donington has been appointed as Assistant Professor of Cardiothoracic Surgery at the Stanford University Medical Center from 11/1/2002 to 10/31/2005.

Kenan Garcia has been reappointed as Assistant Professor of Microbiology and Immunology and of Structural Biology at the Stanford University Medical Center from 11/1/2002 to 4/30/2006.

Paul Heidenreich has been reappointed as Assistant Professor of Medicine (Cardiovascular Medicine) and, by courtesy, of Health Research and Policy at the Stanford University Medical Center from 11/1/2002 to 8/31/2006.

Noreen Henig has been reappointed as Assistant Professor of Medicine (Pulmonary and Critical Care Medicine) at the Stanford University Medical Center from 11/1/2002 to 8/31/2006.

Bradley Hill has been reappointed as Assistant Professor of Surgery (Vascular Surgery) at the Stanford University Medical Center from 11/1/2002 to 8/31/2006.

Mahmood Razavi was promoted to Associate Professor of Radiology at the Stanford University Medical Center, effective 11/1/2002 to 10/31/2007.

Audrey Shafer was reappointed as Associate Professor of Anesthesia at the Palo Alto Veterans' Affairs Health Care System from 11/1/2002-8/31/2007.

Melanie Smitt was promoted to Associate Professor of Radiation Oncology at the Washington-Stanford Radiation Oncology Center, effective 11/1/2002 to 10/31/2007.

Paul Utz has been reappointed as Assistant Professor of Medicine (immunology and Rheumatology) at the Stanford University Medical Center from 12/1/2002 to 8/31/2006

Isidra Veve has been reappointed as Assistant Professor of Anesthesia at the Stanford University Medical Center from 11/1/2002 to 3/31/2006.

Ching Wang was appointed as Associate Professor of Neurology and Neurological Sciences at the Stanford University Medical Center, effective 11/1/2002 to 10/31/2007.

Ann Weinacker has been reappointed as Assistant Professor of Medicine (Pulmonary and Critical Care Medicine) at the Stanford University Medical Center 11/1/2002 to 5/31/2006.

Congratulations to all.

Dean's Newsletter November 18, 2002

HIPAA in the School of Medicine

Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology has indicated that the first in a series of public forums will be held Tuesday, November 19th from 1:00-2:00 PM in the Fairchild Auditorium. As you know, the Health Insurance Portability and Accountability Act (HIPAA) privacy regulations become effective on April 14, 2003. These regulations provide significant new privacy protections for the health information of patients and research subjects. As an academic medical center, Stanford University School of Medicine is implementing significant changes to address the management of health data in research, education and clinical care.

The School-wide assessment and planning phase is nearing completion. A School of Medicine HIPAA Steering Committee is being formed to spearhead the implementation effort in the departments and divisions. Among the important issues that will be addressed are:

- What are these changes and how will your work be affected? What is the timeline for implementation?
- Who is involved in making the changes?
- How can you be certain that your voice is heard? Where can you get answers to your questions?

You are invited to attend the first in a series of public forums on November 19th in the Fairchild Auditorium at 1:00 p.m. At the forum the effort currently underway to

achieve HIPAA compliance will be presented and discussed. Please click <http://reggie.stanford.edu/Signup.asp?638> to register.

Women in U.S. Academic Medicine

The Association of American Medical Colleges (AAMC) just recently released a report entitled “Women in US Academic Medicine Statistics, 2001-2002. The data show some progress and some areas where improvement is needed - including at Stanford. The report includes aggregated data as well as comparative data among US medical schools.

Across the country, women now constitute 48% of applicants and 47.6% of new entrants to US medical schools. At Stanford, approximately 45% of the applicants are women and 55% of the entrants are women. With respect to postgraduate training, the proportion of women has grown to 38% in 2001. Obstetrics & gynecology (71% women) and pediatrics (66% women) are in first and second place respectively. They stand in sharp contrast to surgical specialties, e.g., general surgery (24%), urology (13%) and orthopedic surgery (9%). Clearly, given the proportion of women now enrolling in medical school, there will be serious work-force issues in the years ahead if the trends do not change so that greater proportions of women elect to commit to the surgical specialties.

On a national basis, the proportion of women faculty is 28% nationally and 25% at Stanford. The proportion of tenured women faculty is 15% nationally and 14% at Stanford. Further, at Stanford 23% of women faculty are tenured compared to 40% of men. Perhaps not surprisingly, the proportion of women faculty is lowest in departments of orthopedic surgery (11%) and surgery (13%) and is highest in pediatrics. At Stanford these proportions are 18% for orthopedic surgery, 26% for general surgery and 28% for pediatrics.

Leadership positions on a national basis as measured by division chiefs and department chairs are 16% and 8% respectively. At Stanford, 11% of the division chiefs are women as are 23% of our department chairs.

Although progress has been made for women in medicine during the last decades, much more remains to be accomplished. For additional information, you can review the paper by Janet Bickel et al entitled “Increasing Women’s Leadership in Academic Medicine: Report of the AAMC Project Implementation Committee” and Commentary by Lois Margaret Nora, MD, JD in **Academic Medicine** 2002; 77:1044-1066. Continuing progress and opportunities for women students and faculty must be one of our highest priorities at Stanford in the years ahead.

Council of Clinical Chairs

At the Council of Clinical Chairs meeting on Friday, November 8th, the approach to planning new clinical programs was discussed with the goal of establishing a template for business planning. Given the missions of Stanford Hospital & Clinics and the School of Medicine, it is clear that integrated planning is essential. Critical components include an

assessment of the current state of operations for the proposed clinical program (e.g., recent trends in clinical volume, outcomes, service satisfaction, comparative market position compared to academic or other providers, financial contribution to the hospital and faculty practice, operational constraints), the future goal (i.e., what is being sought to improve the current situation in the areas noted above), strategies to bridge from the current to the future status (including the methods and rationale for volume growth, outreach, improving patient satisfaction, faculty/physician and capital needs along with other resources to support the faculty and staff, impact on other departments and on the School of Medicine, information technology requirements, etc.) and overall financial performance.

Given the size and scope of Stanford Hospital & Clinics, it is imperative that areas for potential growth and development be carefully planned and rigorously assessed both for strategic investment and for likely impact on the hospital, faculty and School. Currently, planning is underway in several clinical programs, including cardiac, cancer, solid organ transplantation, and neurosciences. At the November 8th COCC meeting, a preliminary presentation on the Cardiac Center program was presented by Dr. Robert Robbins, Associate Professor of Cardiovascular Surgery, based on work that he and Dr. Alan Yeung, Associate Professor Medicine (Cardiology) have been carrying out with at SHC. Drs. Robbins and Yeung have been recently appointed to serve as co-directors for the Cardiac Center and have been making significant progress in defining the scope of this important area of clinical medicine.

While developing plans for multidisciplinary centers is a vital component of the strategic initiatives of SHC, LPPH and the School of Medicine, it is also important to underscore that equally critical is the excellence of other important clinical programs, including those in various medical and surgical specialties as well as the novel and important diagnostic and support services that help make institutions great. Accordingly, the leadership is open to suggestions and input from all members of the medical community.

Update from the Executive Committee

At the School of Medicine Executive Committee meeting on Friday, November 15th, we continued our series of reports from basic and clinical departments and heard an excellent update on the Department of Anesthesia by Dr. Ron Pearl, Professor and Chair. Dr. Pearl alerted the Executive Committee to the workforce problems that have impacted departments of anesthesia in the 1990's following erroneous forecasts of an oversupply of anesthesiologists. This resulted in a dramatic decline in the numbers of medical students who applied for training in anesthesia, reaching a nadir in 1996. Since then, with the recognition that the assumptions guiding the workforce projections were incorrect, there has been a national shortage of anesthesiologists, and the numbers of applicants to training programs have increased accordingly. However, these remarkable swings in trainees have had a significant impact on the field of anesthesia. According to Dr. Pearl, these events, coupled with the consequences of managed care and the challenges facing anesthesia departments in predicting the correct size of their workforce since they do not

control the schedule of patients or clinical programs, have eroded considerably the academic underpinnings of departments of anesthesia across the country.

Thankfully, the department of Anesthesia at Stanford has been able to weather this storm, and under Dr. Pearl's leadership, is well functioning and much valued. Indeed, considerable praise for the excellent clinical service provided by the faculty and physicians in the Department of Anesthesia was offered by the chairs of surgical departments following Dr. Pearl's presentation. Nonetheless, Dr. Pearl presented a critical assessment of the challenges at Stanford related to the rapid expansion of both adult and pediatric surgical programs during the past couple of years. These are made more difficult by some of the unique structural anomalies that exist at Stanford that impact further on optimizing efficiency and effectiveness of clinical operations. Equally importantly, Dr. Pearl outlined the special difficulties in training and developing clinician-scientists in anesthesia research but also underscored the importance of doing so and of finding ways to accomplish this at Stanford. There was concurrence, which I certainly endorse, that this must be a priority for both the Department and the School.

We also heard a presentation from Dr. Gabe Garcia, Director of Medical Student Admissions and Associate Professor of Medicine, on the current admissions process at Stanford Medical School. His presentation engaged considerable discussion and interest by the Executive Committee. Dr. Garcia outlined the procedures followed to select the 86 students entering each medical student class from the well over 5000 applicants. A particular area of focus was the solicitation of a broader engagement of senior faculty from both basic and clinical science departments both on the selection committee and in interviewing applicants. There was a consensus that the basic and clinical science chairs would work with Dr. Garcia to identify both junior and senior faculty members in their respective departments to participate in file reading, interviewing and selection of medical students. I am very appreciative of this support since it is clear that the work of the Admissions Committee is among the most important activities of the School. Indeed, it helps define the future of Stanford Medicine.

Labor Strike at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital

As you undoubtedly know by now, the Service Employees International Union (SEIU) Local 715 staged a 24-hour labor strike that began at 5 am on November 13th. Hospital CEO's Martha Marsh (SHC) and Chris Dawes (LPCH) worked diligently to reach an accommodation and resolution to avert this strike. They have each placed excellence in clinical care and support for employees, who provide the service to the hospital and to patients, as their highest priorities. Indeed, it was made abundantly clear how very valued the clinical services are at SHC and LPCH. Without question, assuring a quality work environment for employees in a setting that offers outstanding clinical care and service is a priority that we all share. Thankfully, although the strike did compel the hospitals to reschedule elective surgeries on November 13th, six emergency surgeries were preformed during the day. Moreover, the inspection team from the Department of Health

Services that was on-site during the strike noted the quality of care, teamwork and dedication that was evident among the staff at both SHC and LPCH.

Events Past

Fifth Anniversary Celebration of the Lucile Packard Foundation for Children's Health (LPFCH). On Wednesday evening, November 13th, the LPFCH celebrated its Fifth Anniversary with board members and community leaders and supporters. In five short years, the LPFCH, led by Mr. Stephen Peeps, President and CEO, has made remarkable progress in improving the health and well-being of children in northern California and, by extension and example, throughout the world. LPFCH's tripartite missions include fundraising, grantmaking and information, and they have succeeded in all three. In partnership with the David and Lucile Packard Foundation and the community, they have emerged as the Lucile Salter Packard Children's Hospital's largest source of philanthropy and have provided the highest level of grant support ever achieved for a pediatric effort.

Because of the work and commitment of the LPFCH, the Packard Children's Hospital has emerged, during its 10-year history, as an outstanding community resource as well as a superb center of excellence for the care of children facing the challenge of serious illness. In addition, the LPFCH has supported various community-based programs that improve the lives of children and their families and provide valuable and important knowledge and information to improve the health of children in our community. The wonderful work of the LPFCH has also provided much appreciated support to the School of Medicine and its Department of Pediatrics, further enabling and enriching opportunities in pediatric education, research and clinical care. I am pleased to extend my sincere appreciation and congratulations to the Lucile Packard Foundation for Children's Health.

The Fall Forum on Community Scholarship and Service. On Wednesday evening November 6th, thanks to the efforts of the PriSMS (Public Service Medical Scholars) program, the First Fall Forum on Community Scholarship and Service took place at the Arrillaga Alumni Center. The PriSMS program, originally based on the ideas and creative energy of Stanford medical students Steven Chen and Noemi Steiner, became official in 2000. Since its inception, PriSMS has helped to nurture physician leaders, who will help re-shape the way medicine, research, and service are theorized, practiced and delivered, in public service. The program is directed by Dr. Timothy Stanton along with Ann Banchoff, Associate Director and Michaela Kiernan.

The program included oral and poster presentations by medical students and covered a range of community and international topics. The evening's Keynote Speaker was Dr. Robert K Ross, President and CEO of the California Endowment, who spoke on "The Power of the Community".

In addition to congratulating each of the students who delivered excellent poster and oral presentations, I want to give special thanks to **Shari Chevez** (SMS III) and **Nicole Marsico** (SMS III) for their tremendous work and dedication in organizing this First Fall Forum. I do hope it will be followed by many others in the years to come.

Dean's Staff Recognition Banquet. Also on Wednesday evening, November 6th, the Annual Dean's Staff Recognition Banquet was held in the Faculty Club. Attended by over 230 staff who have worked at Stanford for five or more years, the evening proved to be a wonderful tribute and affirmation to the tremendous work and dedication of those who have truly helped make Stanford the wonderful institution it is today.

Special acknowledgement goes to those who have worked for 20 or more years. These include the following:

Employees with 20 years of service

- Wendy Lee Baumgardner, Radiology
- Pamela Bernstein, Dermatology
- Cecelia Coker, Surgery
- Linda Deasy McLaughlin, Dean's Office/Academic Affairs
- Susan Dejbakhsh-Jones, Medicine/Immunology
- Lawrence Fagan, Medicine/SMI
- Elizabeth Gananian, Pathology/Blood Center
- Gloria Garcia, Medicine/Oncology
- Susan Goodrich, Radiation Oncology/Radiation Biology
- Joyce Hages, Medicine/Cardiovascular
- Stephanie Johnson-Gray, Dean's Office/Controller's Office
- Lisa Joo, Dean's Office/Academic Affairs
- Julia Kraemer, Visual Arts Service
- Lucile Lopez, Medicine/Infectious Diseases
- Margaret Malone, Communications & Public Affairs
- David O'Brien, Dean's Office/Institutional Planning
- Susan Perkins, Pathology
- Elizabeth Pope, Cardiothoracic Surgery
- Holly Schrandt, Pathology/Blood Center
- Georgette Stratos, Medicine/General Internal Medicine
- Behnaz Taidi, Medicine/Oncology
- Eva Vasquez, Dean's Office/Graduate Student Support
- Janice Vierra, Visual Art Services
- Rosario Villacorta, Medicine/Infectious Diseases
- Kuo-Mei Wang, Pathology
- Claudia Weber, Genetics
- Reese Zasio, Comparative Medicine

Employees with 25 years of service

- Joan Bialek, Medicine/Nephrology
- Marie Elaine Casey, Molecular & Cellular Physiology

- Ella Doyle, Microbiology & Immunology
- Perry Everett, Dean's Office/Controller
- Shirley Feldman, Psychiatry
- Dolly Kagawa, Surgery/Emergency Medicine
- Sheryl Ann Kendall, Dean's Office/Planning & Budgeting
- Peggy Kemper, Pediatrics/Neonatology
- Mahmonir Keyhan, Microbiology & Immunology
- Paula Louie, Radiation Oncology/Radiation Therapy
- Frances Monroe, Comparative Medicine
- Rosella Morefield, Medicine/Gastroenterology
- Mary Palmer, Dean's Office/Research Management Group
- Hung Mihn Pham, Surgery, Plastic & Reconstructive
- Diane Rapacchietta, Radiation Oncology/Radiation Biology
- Debra Scheuch, Dean's Office/Controller's Office
- Laural Sledge, Office of Medical Development
- Sharon South, Microbiology & Immunology/Baxter Laboratory

Employees with 30 years of service

- Geraldine Derby, Medicine/Nephrology
- Σ Lucino Hidalgo, Pathology
- Barbara Jean Hill, Biochemistry
- Nancy Houston-Miller, Medicine/Cardiovascular Medicine
- Wendy Leong, Pathology/Blood Center Laboratory
- Melchor Madrigal, Comparative Medicine
- Zera Murphy, Student Affairs, Dean's Office
- Richard Stovel, Genetics

Employees with 35 years of service

- Marjorie Weesner, Genetics

Employee with 45 years of service

- June Hoshi, Biochemistry
- Darla Wilson, Visual Arts

Employee with 45 years of service

- Gene Celis, Comparative Medicine

As the contributions of various individuals were highlighted, it was clear how each played a vital role in providing vital functions to one or more of the missions of Stanford School of Medicine. From student services to animal care or research technology to operational support to clinical or basic science departments, the functions and achievements of the School and its faculty are clearly the result of the contributions of these wonderful employees. Equally impressive to me is the fact that so many of these individuals have had long years of dedicated service to Stanford, clear evidence of their commitment to the School and its value to them.

In addition to the remarkably dedicated members of the Stanford Medicine community, two individuals were selected to receive the SPIRIT Award. This is the second year this award has been given. SPIRIT stands for Service-orientation,

Initiative, Resourcefulness/Reliability, Innovation and Teamwork. While these valued extend across our community, they apply this year to two individuals:

2002 SPIRIT Award Winners

- **Ally Starrett**, Library Specialist/Lane Library
- **Michelle Ferrari**, Research Nurse/Urology

Congratulations and thanks to all of these wonderful employees - it is because of your efforts that we have such a successful School of Medicine.

Berry Foundation Visit. On November 8th, the Directors of the Berry Foundation visited Stanford. The Foundation is named after Walter V. and Idun Y. Berry who initiated a program to support nine post-doctoral fellows each year who are conducting research related to children's health. Since its inception in 1991, Berry Foundation has supported both basic and clinical science post-doctoral scholars thus permitting a score of young investigators to establish and launch productive research careers. A Committee led by Dr. Charles Prober, Professor of Pediatrics, along with Professors Linda Giudice, Mark Kay, Alan Krensky, James Nelson and David Relman, select the Berry Fellows. We are deeply appreciative to the Berry Foundation for this very valuable support.

Moonlighting. On Saturday night, November 9th, I was pleased to discover that our medical students put aside their studies, research and clinical activities to have a wonderful time at the Annual Moonlighting Semi-Formal Event, held this year at the Great American Music Hall in San Francisco. I was also pleased to attend - at least for a little while. Very impressive indeed.

Congratulations

Dr. Kelly Skeff, Professor of Medicine, was honored by the 113th Annual Meeting of Association of American Medical Colleges (AAMC) at a Black Tie event on Saturday November 9th where he received the **Abraham Flexner Award for Distinguished Service to Medical Education**. This award was established in 1958 by the AAMC "to recognize extraordinary individual contributions to medical schools and to the medical education community as a whole". During the past 25 years Dr. Skeff and his colleagues have established a remarkably successful program to help train physicians to become better teachers. Clinicians from throughout the country have enrolled in this program and have taken the skills and knowledge back to their home institutions. In doing so, they have trained others to become better teachers. More recently, Dr. Skeff has begun working with basic science faculty to help improve and extend their teaching skills as well. We are fortunate indeed to have Dr. Kelly Skeff at Stanford.

Communications and Public Affairs. At the AAMC Annual meetings, the Office of Communications and Public Affairs was highly praised and the recipient of several awards. Among these were:

- **Robert Fenley Writing Award for Medical Science Writing:**
- **Ruthann Richter** took the top prize (the Award of Excellence) for the story in the winter/spring 2001 issue of Stanford Medicine titled "Making the Case for Trials."
- **Krista Conger** received the Award of Distinction for "The Hunt is On" in the fall 2001 issue of Stanford Medicine.
- In the category Publications-External Audience Periodicals -- Stanford Medicine was one of three publications to receive an **Award of Distinction**. Rosanne Spector and several other staff were recognized.
- **Special Projects-Public Relations** - The efforts of the Stanford Office of Communications & Public Affairs in promoting the medical center's bioterrorism preparedness plan received one of three **Awards of Distinction**. The entire staff played a direct role including Ruthann Richter, Michelle Brandt, Susan Ipaktchian and M.A. Malone.

Honoring Dr. Richard E. Behrman

Dr. Richard Behrman is one of the pioneering leaders in American Pediatrics. His impact on neonatology, academic pediatrics, community service and pediatric policy has been extraordinary. This past week Dr. Behrman was honored, on the occasion of the Fifth Anniversary Celebration of the Lucile Packard Foundation for Children's Health (see above), by the inauguration of the Richard E. Behrman Lecture Series in Pediatrics. The first speaker in this series was Dr. Paul Newacheck, Professor of Health Policy at UCSF's Institute for Health Policy Studies and the University of California-Berkeley School of Public Health.

In addition, Dr. Behrman learned at the LPFCH Anniversary Event that an endowed professorship at the Stanford School of Medicine was being established in his name.

Congratulations to Dr. Richard Behrman and thanks to the LPFCH for honoring him in such important and significant ways.

Dr. Richard Myers, Professor and Chair, Department of Genetics, has been awarded a renewal of his grant entitled "Production of High-Quality Finished Human Genomic Sequence" from the Department of Energy. This award is for \$38,604,800 over the next 5 years. Congratulations to Dr. Myers and his colleagues.

Appointments and Promotions

Liqun Luo has been promoted to Associate Professor of Biological Sciences, effective 12/1/2002.

Thomas Rando has been promoted to Associate Professor of Neurology and Neurological Sciences, effective 12/1/2002.

Congratulations!

Dean's Newsletter

December 2, 2002

First Annual Presentation on Diversity in Graduate Education

On Friday, December 6th at 4:30 p.m. in the Fairchild Auditorium. Dr. Freeman Hrabowski, III, President of the University of Maryland, Baltimore County will give the First Annual Symposium on Diversity in Graduate Education. Dr. Hrabowski is a scholar and educator who has won national recognition for his work on increasing minority participation in math and the sciences. His presentation is entitled "Modeling for Success."

For additional information please contact Kimberly Griffin at kgriffin@stanford.edu or at 724-2815.

Moving Toward Curriculum Renewal

We are moving toward a renewal of the Medical Student curriculum designed to permit Stanford students to benefit as optimally as possible from the exceptional faculty and resources that exist at the Medical School and the University. The three guiding principles for the curriculum renewal include, first, defining the essential knowledge that students need for lifetime learning in medicine and bioscience and, as much as possible, to teach this in an integrated manner. Second, we are eager for students to begin learning clinical medicine in parallel with basic science at the outset of their medical education and to keep basic and clinical science closely aligned throughout medical school and through post-graduate education. Thirdly, we are eager for our students to pursue in-depth learning in a specific area of medicine or science through a "scholarly track" or "major and/or concentration." We believe this type of scholarly experience will enable them to become uniquely proficient and poised for leadership and a career of significance.

Needless to say, making curriculum changes is always a challenge, especially given the various constituents and stewards who are involved. Moreover, it is a process that is continually unfolding and evolving. Although a number of committees have been working diligently during the past months on this process, it seemed prudent to hold a leadership meeting to reaffirm our commitment to this important process. Accordingly, on Monday night, November 25th, a group of basic and clinical science course directors,

members of the Faculty Senate, Dean's Office, and students gathered to review the vision for the new curriculum and the accomplishments that have occurred to date – as well as the significant obstacles and challenges that remain ahead. This important meeting was co-chaired by Dr. Ted Sectish, Assistant Professor of Pediatrics and Chair of the Committee on Courses and Curriculum and Dr. Neil Gesundheit, Associate Professor of Medicine and Associate Dean for Medical Education. The group had a spirited discussion and crafted a process and timeline that would permit the initiation of changes to begin for the class entering in 2003. These principles were also articulated by a Charge to the CCC on April 24, 2002. While ambitious, the agenda is doable, although it will surely require accommodation, adjustment and compromise.

I am excited by the progress that has been made and do very much believe that we have the opportunity to develop a revitalized learning environment for our students and faculty that will impact on generations of future Stanford Medical Students. I want to add my personal commitment to affirming the importance of this process and the need for the current momentum to be sustained and enhanced during the months ahead.

Accessing and Tracking Faculty Appointments and Promotions

I am pleased to let you know that Ms. Linda Deasy McLaughlin, Assistant Dean for Academic Affairs, and her colleagues in Academic Affairs have announced the launch of *Faculty Appointment Tracking* on the web. This will permit Department Chairs and their designates to access updated information on the status of faculty actions on the web. Hopefully this will make the information more accessible to faculty within their departments.

The Dean's Office is actively working on ways to further streamline the appointment and promotion process for faculty and staff physicians. Details about this will be forthcoming in future Newsletters.

Remote Access to Online Lane Library Resources at the VA

The Office of Information Resources and Technology is pleased to announce that Stanford users at the Palo Alto VA can now receive access to online library content. Lane Library has completed extensive software testing and negotiations with publishers to create a secure and robust method for viewing online library content from off campus. For details connect to: <http://lane.stanford.edu/online/remotearchive.html>.

Please note some titles are still restricted to on campus use only per license restrictions. This list is constantly being updated. Contact laneinfo@lanelib.stanford.edu or 723-6831 for assistance

World AIDS Day 2002

Thanks to the efforts of Brent Kobashi, SMS I, and the Stanford World AIDS Day Committee, a moving Forum was held on Monday evening, November 25th. Despite the fact that AIDS has now passed the 20 year mark, its impact on human life remains

significant, especially in developing nations. Although much progress has occurred in the past two decades in both basic science and the clinical care of HIV/AIDS, the disparity of treatment and prevention strategies globally remains significant and is in some ways further deteriorating. It is imperative that we not become complacent about this devastating disease and that we serve as advocates for the delivery of care, treatment and preventive regimens on global basis.

Staff Seminar Series Begins December 4th

In order to engage as many members of our medical school community in the exciting advances that are taking place in medicine and science, we are introducing a *Staff Seminar Series*. The purpose of this seminar series is to give administrative staff an opportunity to hear faculty talk about the science and research that is being done in the School of Medicine, and to give staff a better understanding and closer connection with the research and teaching mission of the School of Medicine

On Wednesday, December 4, 2002 in the Munzer Auditorium, Beckman Center, from 4-5 PM, Dr. James Nelson, Rudy J. and Daphne Donohue Munzer Professor in the Department of Molecular and Cellular Physiology and Senior Associate Dean for Graduate and Postdoctoral Education, will be the first speaker. **Registration is required. To register, click on the web site, <http://reggie.stanford.edu/signup.asp?648>**

Town Hall Meeting Regarding the Professoriate

On Thursday, December 19th at 5:30 p.m. in the Fairchild Auditorium, a Town Hall Meeting on the Professoriate will be hosted by David K. Stevenson, M.D., Senior Associate Dean for Academic Affairs. The topic for the Town Hall Meeting is to clarify the criteria for appointment and promotion in the Medical Center Line (MCL) – Clinician-Investigator Line. This forum will allow faculty to ask questions on all related matters. All faculty are invited to attend.

Congratulations

Judy Illes, Senior Research Scholar at the Center for Biomedical Ethics, and a member of the Department of Radiology, was recently honored by the *Women in Neuroscience*, by being elected President-Elect. *Women in Neuroscience* is an international organization of about 900 members, associated with the Society for Neuroscience. It was founded in 1980 with the chief purpose of fostering the development and career advancement of women scientists, particularly in the field of neuroscience.

Appointments and Promotions

- **Joachim Hallmayer** has been appointed Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 12/1/2002 – 11/30/2008.
- **Thomas Rando** has been promoted to Associate Professor of Neurology and Neurological Sciences effective 12/1/2002.

- **Philip Tsao** has been appointed Assistant Professor (Research) of Medicine (Cardiovascular Medicine), effective 12/1/2002 – 11/30/2005.

Dean's Newsletter

December 16, 2002

Holiday Wishes

I want to extend to each of you my very best wishes for the Holidays and New Year. It has been a privilege to have served you and the Stanford community during this past year (my first full calendar year) and I look forward to many more years of collaboration and partnership. I hope in particular that you have a Happy Holiday Season and New Year.

Translating Discoveries: The 2002 Annual Report of the Stanford School of Medicine Strategic Plan

The year 2002 began with the compilation of our Strategic Plan for the Stanford University School of Medicine. By now all of the faculty in the School should have received “Translating Discoveries”, which details the strategic plan and crafts a road map for the future of Stanford Medicine. This represents the first attempt by the Medical School in over 30 years to establish a shared and compelling vision of its future and a systematic and comprehensive plan to achieve that vision. Coming at a time of profound change in academic medicine and the biomedical sciences, and during a period of severely constrained resources across the University and Medical Center, the strategic plan provides the school with a critical guide for helping to define the future of academic medicine.

The essence of the Medical School's strategic plan is captured in the school's mission statement, *“To be a premier research-intensive medical school that improves health through leadership and a collaborative approach to discovery and innovation in patient care, education, and research.”* Among the key elements in this statement are leadership, collaborative discovery and innovation that will impact on our core missions in clinical care, research, and education. We believe that this will emerge largely through our focus on translational research and on medicine that brings together basic and clinical scientists to improve health, better educate our medical and graduate students, and develop novel approaches to research.

In addition to the published version of “Translating Discoveries,” an executive summary and a full text version of the strategic plan can be viewed and downloaded from the strategic plan website at <http://medstrategicplan.stanford.edu/>. This will of course be updated on a regular basis in the months and years ahead.

It is important to recognize that some of the goals and accomplishments defined below are directly related to the strategic plan, whereas others are natural extensions of our

regular operations. Understandably there is a natural blending of what we are currently doing and what will drive our agenda in the years ahead. It is also important to note that the inclusions are selected from a larger list of operational and strategic initiatives and accomplishments. Most importantly, these goals and accomplishments are the result of hundreds of hours of work by faculty, staff and students. I am indebted to one and all for helping to make Stanford a better medical school.

In addition to the programmatic planning that embodies our Strategic Plan, we have also been very much engaged in long-range facility planning within the School and Medical Center and in relation to the University. An important aspect of this involves developing our facilities master plan not only for the next decade but for the 10-30 years that follow.

MEDICAL EDUCATION

The strategic plan for Medical Education affirms the school's commitment to excellence in the clinical training of medical students through curriculum reform and student scholarship and innovation. The most significant Medical Education strategic plan activities in 2002 involved the initiation of a comprehensive curriculum reform effort and the initiation of the Medical School's project for new educational facilities.

In addition, during 2002 significant progress was achieved on a number of key Medical Education goals and initiatives. These include:

Goal #1: To recruit, admit and retain a diverse group of students destined to become innovators in medicine and closely related disciplines.

- The Medical School Faculty Senate and Executive Committee approved changes to faculty involvement in the applicant interview and evaluation processes. These changes will help to ensure that our best applicants are identified and that they are left with a positive impression of the Medical School.
- An initial review of the school's applicant evaluation criteria was undertaken in light of anticipated curriculum revisions.

Goal #2: To foster and facilitate teaching, advising and mentoring among our faculty.

- Under the direction of the Senior Associate Dean for Medical Education, a "Teaching Incentives Committee" was established. This committee will develop specific recommendations for incentives programs to improve faculty teaching and pedagogy.
- The Medical School Executive Committee approved the development of a departmental planning process that will ensure the explicit recognition of education as an essential element of each department's mission.

Goal #3: To ensure a rigorous and robust curriculum that assures outstanding clinical skills and promotes in-depth scholarship.

- In conjunction with the Medical School Faculty Senate and the Committee on Courses and Curriculum, *ad hoc* Dean's committees on the "Core Curriculum" and "Scholarly Tracks" were established. Through these committees, the Medical School

began the development of a new medical curriculum based on the realignment, resequencing, and improved integration of basic and clinical education and on the introduction of “scholarly tracks” as a new essential element of student scholarship. We anticipate that the first significant change in the medical student curriculum will commence in the Fall of 2003.

- A new medical student pre-differentiation program was proposed and approved, allowing new students an early opportunity to explore the scholarly and curricular opportunities of the reformed curriculum.
- The Medical School began the process of developing new educational facilities by establishing an executive committee for the Stanford Medical Information and Learning Environment (SMILE) project. Separate programming committees were also established and activated in the areas of Instruction and Learning Technology, Lane Library and Information Services Technology Infrastructure, Student Services, Student Amenities, Public and Event Spaces, and Dean’s Office.

Goal #4: To promote opportunities for community service and patient advocacy.

- A joint Committee on Community and Public Service was established through the Dean’s Office to develop recommendations for a comprehensive Medical School program.

Goal #5: To provide support for a successful transition to a career in academic medicine.

- Discussions were initiated between the Medical School Dean’s Office, Department Chairs, and Hospital management regarding the missions, programs and management of residency and fellowship programs.
- The annual “Dean’s Letter” was revised to provide residency programs with more informative assessments of student skills and performance.

GRADUATE EDUCATION

The strategic plan for Graduate Education affirms the school’s continuing commitment to an interdisciplinary approach to graduate education and to the school’s responsibility to prepare its students for careers in science. The most significant Graduate Education strategic plan activities in 2002 involved the initiation of a new graduate student recruitment and career counseling programs.

In addition, during 2002 significant progress was achieved on a number of key Graduate Education goals and initiatives. These include:

Goal #1: To ensure that biosciences students are the highest-quality students available and that they are offered an unsurpassed quality, depth and breadth of graduate research opportunities.

- A new position of associate director for graduate student recruitment was created and filled by Ms. Kimberly Griffin. Included within this position’s responsibilities is the development of effective programs to support the recruitment of under-represented minorities to Stanford.

- To ensure that their educational facilities needs are met, biosciences graduate education programs representation was included in the SMILE project executive committee and in the separate programming committees.
- Graduate student housing opportunities were enhanced through the increased allocation of Stanford West units to graduate student populations.
- Graduate student childcare program enhancements were developed and recommended to the University for future implementation.

Goal #2: *To provide high quality training programs that feature innovative, multi-disciplinary and student-initiated course offerings.*

- A joint School of Medicine-School of Engineering Department of Biomedical Engineering was approved by the University Trustees in June, 2002. A joint graduate program and undergraduate program will unfold over the course of the next 2-3 years.

Goal #3: *To provide and encourage opportunities for scientific interchange and student-initiated cross-disciplinary training and to provide continued individualized guidance for each student's research and education.*

- A new graduate student pre-differentiation program was approved, allowing new students an early opportunity to explore the breadth and diversity of graduate program offerings through the Fall Forum: *Pre-differentiation in the Biosciences*.

Goal #4: *To provide support to optimize opportunities for further training and a successful transition to a career in the biosciences.*

- A new joint biosciences and postdoctoral professional outreach center was approved, providing graduate students with career counseling support by knowledgeable professional staff.

POSTDOCTORAL TRAINING

The strategic plan for Postdoctoral Training reaffirms the school's continuing commitment to supporting and facilitating the development of postdoctoral scholars into independent scientists while acknowledging the critical role that postdoctoral scholars play in the medical school's success. Key to the continued success of the Medical School's Postdoctoral Training programs is renewed attention to the economic environment of postdoctoral training. The most significant Postdoctoral Training strategic plan activities in 2002 involved enhancement to postdoctoral scholars' compensation programs and new institutional guidelines for training program quality.

In addition, during 2002 significant progress was achieved on a number of key Postdoctoral Training goals and initiatives. These include:

Goal #1: *To ensure that the intellectual, research and work-life environments at Stanford attract and retain the highest quality postdoctoral scholars.*

- A revised minimum compensation scale was implemented, providing significant compensation increases for most postdoctoral scholars, particularly those in the early years of their training.
- Substantial postdoctoral scholars benefits plan enhancements including disability life insurance and dental insurance benefits adopted.
- Postdoctoral scholars childcare program enhancements were recommended to the University for future implementation.
- A postdoctoral scholars' housing subsidy program was recommended to the Dean's Office for future implementation.

Goal #2: To recognize the contributions of postdoctoral scholars to the success of the University's research and teaching missions.

- The Provost approved the designation of "Postdoctoral Scholar" for all postdoctoral trainees.
- A Dean's committee was proposed to address the issues of program curriculum, quality, accountability and support for clinical fellows.

Goal #3: To provide postdoctoral scholars with an appropriate balance of freedom and support.

- A new policy establishing a maximum duration of training of five years for the Medical School's postdoctoral scholars (except for clinical fellows) was approved.
- The Medical School adopted the COSEPUP guidelines for postdoctoral mentoring.
- Staffing enhancements in the Office of Postdoctoral Affairs were approved in order to provide added support for the effective communication and dissemination of information on training program and educational opportunities.

Goal #4: To provide support for postdoctoral scholars to pursue the career paths of their choice.

- A new joint biosciences and postdoctoral professional outreach center was approved, providing postdoctoral scholars with career counseling support by knowledgeable professional staff.

RESEARCH PROGRAMS

The strategic plan for Research Programs recognizes the critical role of unique investigator-initiated research in tandem with collaborations and interdisciplinary programs in successful pursuit of new scientific areas. It also acknowledges the Medical School's resource limits and supports the more efficient allocation of research resources. The most significant Research Programs strategic plan activities in 2002 involved the development of guidelines for the creation of Medical School Institutes and the development and organization of data on the school's research resources.

In addition, during 2002 significant progress was achieved on a number of key Research Programs goals and initiatives. These include:

Goal #1: To ensure scientific excellence, innovation, and leadership through the recruitment and retention of outstanding faculty.

- Policies for the reassignment by the Dean's office of space to be vacated by Clark Center faculty were established and communicated.
- An inventory of Medical School "Centers" and other non-traditional academic units developed.
- Guidelines for the establishment of "Institutes" at the Medical School were developed and will be presented to the School's Executive Committee in January.
- A faculty demographic model forecasting future faculty turnover and recruitment opportunities was developed.

Goal #2: To be a world-leader in the translation of knowledge and scientific innovation to clinical applications.

- An inventory of all existing research core facilities and associated financial support and conducted a user survey to evaluate satisfaction and future needs was developed.
- "Translational Research and Medicine" was established as a dominant consideration in founding new Institutes. On December 10th we announced the formation of the Stanford Institute for Cancer/Stem Cell Biology and Medicine with Dr. Irv Weissman as the Director and Dr. Karl Blume as the Associate Director for Clinical Investigation. This Institute is being initiated with a founding gift of \$12M from an anonymous donor. This new Institute attracted considerable attention in the national media this past week.

Goal #4: To identify and foster strong interdisciplinary research efforts based on individual disciplinary strengths.

- Website design and redesign were initiated to better communicate faculty research interests and Medical School research initiatives.

CLINICAL PROGRAMS

The strategic plans for both the Adult and the Pediatric and Obstetric Clinical Programs recognize the critical role a robust, efficient, flexible and financially sound clinical practice plays in the success of the Medical School's education, research and clinical care missions. Clinical Programs strategic plan activities in 2002 addressed the fundamental issues of faculty practice organization and faculty physician staffing. It is also important to underscore that planning in this area requires a special alignment with the hospitals. Of these, Stanford Hospital & Clinics underwent new leadership this past year when Martha Marsh became President and CEO on April 2nd. It is anticipated that even more robust clinical planning will unfold during the next year.

Important goals achieved for 2002 include:

- Continued collaborative development of a formal faculty practice organization for Pediatric and Obstetric services under the leadership of Dr. Ken Cox, Senior Associate Dean for Obstetric and Pediatric Clinical Affairs. Our intent is to implement this organization in early 2003

- The “Council of Clinical Chairs” was established with SHC to provide advice and support by the clinical faculty leadership to institutional clinical initiatives. This committee is co-chaired by Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs and Mr. Mike Peterson, Chief Operating Officer, SHC.

ACADEMIC AFFAIRS

The strategic plan for Academic Affairs (the Professoriate) addresses the need to create and maintain a unified community of faculty that is able to support with excellence the broad range of academic responsibilities associated with the Medical School’s goals in education, translational research, and medicine. Academic Affairs strategic activities in 2002 were focused largely on the necessary revisions to the Medical School’s professoriate.

In addition, during 2002 significant progress was achieved on a number of key Academic Affairs goals and initiatives. These include:

Goal #1: To promote a professoriate that values equally the activities and contributions of all scholars, including researchers, educators and clinicians.

- A revised structure for the Medical School’s professoriate based on the functional roles of Educator, Investigator, Clinician/Investigator, and Clinician/Educator and Voluntary Clinical Educator was implemented.
- Revised and clarified appointment and promotion criteria for faculty in the Non-tenure line (Research) and Non-tenure line (Teaching) were implemented.
- Revised and clarified appointment and promotion criteria for Lecturers and Staff Physicians were implemented.

Goal #2: To support the continued professional growth of each faculty member through clear faculty role definitions and focused and effective career development programs.

- The development of a Medical School protocol for career development, goal setting and tracking for assistant and associate professors was initiated.
- Discussion with the University’s Office of Training and Organizational Development to develop a program for faculty as managers was initiated.

Goal #3: To maintain effective programs of future faculty development and outreach that recognizes the value to the medical school’s mission of a diverse faculty across all ranks.

- The Dean’s Committee on Women in Medicine and Science was established.
- The Dean’s Committee on Faculty Diversity was established.
- The Dean’s Joint Committee on Community and Public Service was initiated.

INFORMATION RESOURCES AND TECHNOLOGY

Following the Spring 2002 appointment of Dr. Henry Lowe as the Medical School’s Senior Associate Dean for Information Resources and Technology, an IRT strategic

planning group was established. The resulting IRT Strategic Plan outlines a comprehensive program for collaborative and local efforts and investments in IRT resources. Among the most noteworthy of the initiatives proposed in the IRT Strategic Plan are:

- Establish a joint School of Medicine, University, and Hospital information technology planning process to ensure that IT initiatives and architecture are interoperable and complementary.
- Develop a secure, standards-based wireless network for the School of Medicine that integrates with the wireless infrastructure of the University and the Hospitals.
- Develop a secure, Web-based intranet, supporting single sign-on, authentication and digital signature, to support the administrative, clinical, research, and educational needs of the School of Medicine.
- Promote and support the development of high-performance computing and network resources for Medical School users.
- Develop, in collaboration with the hospitals, a standards-based, large-scale clinical research data repository that will serve as a single point of secure access to integrated clinical research data.
- Develop a secure infrastructure using the School's data center, security, network and database initiatives to support the School of Medicine's translational research mission, including clinical trials data acquisition and management.
- Develop and implement a Learning Technologies Strategic Plan that integrates with the overall information technology strategic plan for the Medical School.
- Develop and implement a Biomedical Library Strategic Plan that integrates with the overall information technologies strategic plan for the School.
- Develop collaborative mechanisms to ensure that University and Hospital information systems meet the School's needs, offer high quality service, and integrate well with the School's IT infrastructure.

FINANCE AND ADMINISTRATION

The strategic plan for Finance and Administration fosters and reinforces the role of the administrative staff as partners with the faculty and students in the pursuit of the Medical School's mission. Finance and Administration's strategic activities in 2002 were focused largely on the continuous alignment of the administrative structure and financial mechanisms to the needs of the school's mission-based activities.

In addition, during 2002 significant progress was achieved on a number of key Finance and Administration goals and initiatives. These include:

Goal #1: To create a responsive administrative organization that effectively provides the resources, infrastructure and incentives required to support the School's education, patient care and research activities.

- The breadth and diversity of non-traditional academic units within the Medical School were surveyed and documented.
- A Dean's committee was initiated to develop recommendations for revisions to the Medical School's Operating Budget allocation methods.

Goal #2: *To ensure the optimum utilization of the School's resources.*

- A Medical School Office of Institutional Planning was created to develop and manage a continuous planning and evaluation function.
- The development of a departmental planning process was approved to augment the Medical School strategic plan and to replace the departmental review process. This planning process is currently being assessed in conjunction with the Department of Medicine.

Goal #3: *To ensure that administrative decisions and processes are understood by those affected.*

- The development of a Finance and Administration website was initiated.

Goal #5: *To continuously promote a culture that clearly recognizes and values the role of staff as partners in the success of the School's core missions.*

- A staff seminar series was initiated to better connect the school's administrative staff to its mission. The first such session was held on December 4th and was led by Dr. James Nelson, Senior Associate Dean for Graduate Education and Postdoctoral Affairs.

ADVOCACY, PUBLIC POLICY AND PHILANTHROPY

The strategic plan for Advocacy, Public Policy and Philanthropy establishes a new and prominent role for the School of Medicine as a national leader and advocate on issues germane to academic medicine. Advocacy, Public Policy and Philanthropy's strategic activities in 2002 were focused on the development of a medical school expertise in government relations and on the conceptual development of the medical school's needs within the broader University context.

In addition, during 2002 significant progress was achieved on a number of key Advocacy, Public Policy and Philanthropy goals and initiatives. These include:

Goal #1: *To communicate the medical school's excellence and accomplishments in education, patient care and research.*

- The Medical School's strategic plan was published and broadly distributed.
- A new communication strategy for the medical school based on the priorities and needs of the strategic plan was developed.

Goal #2: *To advance the mission of the School of Medicine by maximizing the generation of private philanthropic support.*

- A conceptual estimate was developed for the objectives and costs of a Medical School campaign. The coordination of this plan with Stanford Hospital & Clinics, Lucile Packard Children's Hospital, Lucile Packard Foundation for Children's Health and the University was begun, with the goal of developing an integrated strategy for 2003.

Goal #3: To actively engage the public to foster an appreciation for the importance of academic medicine to the health of the community and the nation.

- A Medical School Office of Government Relations was established with a recruitment nearly completed at the time of this report.

CONCLUSION/SUMMARY

During 2002 we have made progress in establishing a road map for Stanford Medicine under the banner of Translating Discoveries. Equally importantly, we have made progress in implementing some of these strategies. At the same time, there remains an enormous agenda to fulfill during the next year and those that lie ahead. But each step should bring us closer to fulfilling our mission as a *premier research-intensive medical school that improves health through leadership and a collaborative approach to discovery and innovation in patient care, education, and research.*

Again, I want to thank the enormous number of individuals who have worked to bring the Strategic Plan to its current stage – and, of course, the even greater number who will help us fulfill in the years ahead.

Material Transfer Agreements

I would like to inform you that effective immediately, all Stanford personnel who wish to share human tissue or blood products with an individual or organization outside of the university must do so using a Material Transfer Agreement (MTA). There should be a brief scientific justification for the sharing of material provided with the MTA. Exchange of tissue or blood products for remuneration is not a sufficient justification. For additional information on how to complete an MTA, contact the Office of Industrial Contracts in the Office of Technology Licensing (OTL) or go to the website at <http://otl.stanford.edu/industry/resources.html>.

Special Thanks

The Dean's Office would like to acknowledge and thank the Web & Multimedia Services of the Medical School's MedIT division for their assistance, technical abilities and guidance in publishing and distributing the Dean's Newsletter. Their lead web designer, Kevin Boyd, has been especially helpful in all aspects of producing the Newsletter.

Announcement

Pay Library Fines with Food Donations: The Lane Medical Library is accepting food for unpaid fines through December. Donations will go to the Second Harvest Food Bank. The Library will accept non-perishable foods, e.g.: powdered milk, peanut butter, pasta, tuna, cereal, canned foods (stew, chili, soup), and 100% fruit juices (in single serving boxes). No glass or perishable items, please. The Library will award \$1.00 credit for each

donated item. The Library will gladly accept food donations from patrons without fines as well. Donations will go to the Second Harvest Food Bank.

Appointments and Promotions

- **Paul Khavari** has been promoted to Professor of Dermatology, effective 1/1/2003.
- **Norman Silverman** has been appointed as Professor of Pediatrics (Pediatric Cardiology) at the Lucile Salter Packard Children's Hospital, 1/1/2003 to 12/31/2007

Congratulations!

Dean's Newsletter January 6, 2003

Happy New Year

Although the University has been relatively quiet during the past two weeks, the Medical School and Medical Center have been humming at its usual brisk pace since prior to the New Year. January 1st already seems long ago – but not so distant as to evoke a wish for Happy New Year to all.

We can surely look forward to an exciting and busy year. As we do so, I hope that each of you will also have time to pursue your additional personal interests, to enjoy your family and friends and rejoice of the benefits of living and working in such a beautiful and stimulating environment.

It has been a privilege for me to get to meet a large number of you during the past year and I look forward to additional opportunities in 2003. Best wishes to all for the New Year.

Translating Discoveries: The Stanford School of Medicine Strategic Planning Objectives for 2003

During the latter half of 2001 and throughout 2002, the School of Medicine has worked hard to develop its strategic vision, initiatives and plans for the first part of the 21st Century. To do so we have focused on our core missions in education, research, patient care, and service to our communities, locally and globally. We have formulated an action

plan that is codified in “*Translating Discoveries*” which readers of this Newsletter should have received by mail and which is also available as a downloadable PDF file at <http://medstrategicplan.stanford.edu/>. If you have not received a copy of “*Translating Discoveries*” and would like one, please contact us.

In the December 16, 2002 issue of the Dean’s Newsletter, I summarized some of the work we have carried out this past year in both launching and implementing our strategic plan for the Stanford University School of Medicine. While some of our short-term objectives have been fulfilled, many of our most important longer-term ones will take years to fully achieve. These include changes in education, new directions in research, and enhancements of clinical programs. These programs will require the efforts of many and ultimately involve needs for new programs and facilities. To be successful, it is important that the core goals are understood and supported by the School’s leadership and, equally importantly, by our faculty, students and staff. I hope that you will take the time to review *Translating Discoveries* and offer your comments to me or one of the cognizant Deans. I also hope that you will participate directly in our planning and help us to make Stanford a role model among research-intensive schools of medicine.

I am taking the liberty of highlighting below some of the key objectives we are setting for 2003. Clearly this is a high-level sampling; it does not include the many important initiatives that will be conducted through the basic and clinical science departments and by our faculty, students and staff both in conjunction with the School’s strategic plans and/or as an extension of them. Further, we will refine and develop these and other initiatives during and following our Second Strategic Planning Retreat that is scheduled for January 30 – February 1, 2003.

As always, I welcome your feedback.

Interrelatedness

It is important to underscore first that quite purposefully our Strategic Planning efforts have simultaneously engaged our multiple missions and support structures. From the onset it was clear to me that the manner in which we shaped our plans for education should have consonance with our research and clinical care missions. Similarly, the changes we make in one mission area will surely impact others, making it essential that we look at the interrelatedness of the threads that form the fabric of our academic medical center. Furthermore, aligning our strategic plans and initiatives with the resources we need to achieve them – through administration and finance, information technology, communications and philanthropy – is equally essential. Indeed our ultimate success will rest heavily on how able we are to move forward together, as Stanford Medicine, to fully achieve our mission of being *a premier research-intensive medical school that improves health through leadership and a collaborative approach to discovery and innovation in patient care, education, and research.*

Medical Education

The rejuvenation of a contemporary medical curriculum is a delicate and complex undertaking. Yet, it is among the most significant activities a medical school can pursue. Our strategic plan for medical education is centered on the alignment of the Medical School's mission—to translate research into clinical practice — with its medical curriculum.

Building on the momentum we gained in 2002, the medical education strategic plan activities for 2003 will focus on three major areas:

1. The continued definition and implementation of a “translational” medical education curriculum;
2. The development and implementation of effective mechanisms to honor, promote and facilitate teaching;
3. The continued development of a medical education facilities program for the planned Stanford Medicine Information and Learning Environment (SMILE).

The curriculum reform efforts in 2002 have focused on the overall structure, teaching methods, and content of a contemporary Stanford medical curriculum. To this end, the Dean's Office has worked with the Faculty Senate who has defined several important curricular objectives:

1. The development of “scholarly tracks” as described in the Medical School's plan;
2. Better integration of clinical and basic sciences throughout the curriculum;
3. An enhanced introduction to clinical medicine early in the curriculum;
4. A decrease in our currently hefty lecture time.

With these mandates, and with a project governance and approval process now in place, our goals for 2003 are to have a new “Year 1 Curriculum” in place in September 2003. Concurrent with this effort will be the definition of the core elements and structure of the remaining years of the curriculum. These will be rolled out sequentially in the following years. These years will again be constructed to fit the objectives outlined by the Faculty Senate.

Recognizing that any curriculum can only be as good as those who teach, our 2003 efforts will include completion of recommendations by a Teaching Facilitation Committee that will develop mechanisms to facilitate high-quality teaching, teaching innovation and collaboration, and interdisciplinary teaching between departments.

The SMILE project progressed, in 2002, from a facilities “problem” to an acknowledged facilities “project.” In 2003, this project will further progress from its current conceptual status to a Board-approved project with a defined program, site, and budget. The goal of medical education in 2003 is to work through the SMILE project team to clearly define an affordable facilities program for our core educational/teaching areas, for our student administration functions, and for our other student-focused amenities.

Graduate Education

The strategic plan for the Medical School's Graduate Education programs for 2003 will leverage the advantages from our existing strengths in programmatic flexibility and educational opportunity. In 2002, our efforts were largely focused on the elimination or mitigation of barriers to choice at the initiation and completion phases of the graduate program experience.

In 2003, the graduate education programs strategic plan activities will focus on the creation of enhanced educational opportunities within the graduate curriculum in three areas:

1. Interdisciplinary programs within the Medical School;
2. Interdisciplinary programs with other professional schools;
3. Collaborative opportunities within the local biotechnology industry.

The strategic plans of both the Medical Education and Graduate Education programs recognize the added value that each can bring to the other. Working initially with the Cancer Biology/Tumor Biology Program and the Stanford Brain Research Center, our goal for 2003 is to enhance collaboration of graduate programs with the clinical sciences in order to establish novel research-oriented courses in human health and physiology and disease mechanisms designed for biosciences students. The ultimate goal is to develop programs that engage and expose graduate students to the challenges of clinical medicine and translational research.

Currently, the Graduate Biosciences Program already includes numerous inter-school opportunities, particularly with the School of Humanities and Sciences. Significant additional inter-school opportunities are anticipated with the School of Engineering as a result of the newly established joint Department of Bioengineering. In 2003, opportunities for additional novel educational programs will be explored with other professional schools at Stanford, including Education, Law and Business.

To better prepare our graduates for careers that may bridge academia and industry, we are also committed to strengthening our programmatic relationships with the biotechnology community. In 2003, our goal is to develop program recommendations for joint seminars, workshops and internships with biotechnology partners.

Postdoctoral Scholar Training

Although additional progress is needed, some advances were made in 2002 in the mitigation of some of the major financial/economic barriers to our recruitment and retention of the highest quality postdoctoral scholars. In 2003 the postdoctoral training programs strategic plan activities will focus on two areas; continued strategies and options to address outstanding economic issues faced by postdoctoral scholars and the further development and documentation of institutional programs and guidelines for training program quality. In addition, one of our goals for 2003 is to continue to work

with the Provost's Office to develop affordable and effective housing and childcare programs for postdoctoral scholars for inclusion in the FY04 budget.

Recognizing that there are important differences in the goals and needs of clinical fellows associated with the School's Clinical Departments, Dr. Charles Prober has agreed to chair a committee that will advise the Dean's office one how to enhance the training of this important and vital group of postdoctoral scholars.

With the recent implementation of the Medical School's maximum duration of training policy, effective and high-quality mentoring and career management programs become even more important. In 2003, we will develop and distribute a "Best Practices" mentoring manual and we will develop and implement mentoring guidelines for "Exit Strategies" for postdoctoral scholars.

Research Programs

It is recognized that the best research is investigator-initiated and follows creative new directions supported by peer-reviewed funding. We clearly want to do everything possible to enhance basic research and, in addition and wherever possible, to foster an environment that engages basic and clinical faculty in collaborative research activities, ideally to translate research from the laboratory to the patient. Accordingly, our goals for research for the School of Medicine include:

1. Fostering and supporting an environment that values and promotes basic research;
2. Assessing what is needed to promote translational research among basic and clinical investigators;
3. Developing a small number of "Stanford Institutes of Medicine" that will bring together basic and clinical scientists and physicians, in a virtual manner, to facilitate and augment basic and translational research in selected, complex, multidisciplinary areas that are not fully encompassed within existing departmental structures;
4. To determine the space requirements for wet and dry laboratory research for the School of Medicine during the next decade within the comprehensive long-range facilities planning activities currently ongoing within the Medical Center and University.

During the latter months of 2002, we developed the draft guidelines for Institutes in the School of Medicine – which will be reviewed by the Executive Committee in January and discussed at the SoM Strategic Planning Retreat on January 30- February 1st. Of note, we announced the first of these efforts, the Stanford Institute for Cancer/Stem Cell Biology and Medicine in December of 2002, with Dr. Irv Weissman as Director. As you likely know from prior communications, this announcement generated significant interest and had considerable coverage within the lay and scientific press during the past weeks. During the next couple of years we envision the additional development of 2-3 Stanford Institutes of Medicine that will also follow important multidisciplinary directions.

While the aforementioned Stanford Institutes of Medicine are an important part of our agenda, even more important is the support for basic and translational research that permeates the entire School – without any specific organizational umbrella. Accordingly, in 2003 we will be examining a variety of ways to better support basic and clinical collaborative research initiatives and cross-disciplinary seminars featuring the work of Stanford faculty. We will also examine better ways to support clinical research and explore a model of developing a clinical research unit to support non-NIH sponsored clinical research in a manner analogous to the NIH funded GCRC.

One of the greatest challenges we face in 2003 and the years ahead is the limitations in research space. A significant aspect of this includes the aging space in the Grant, Always, Lane and Edwards buildings as well as the Fairchild Science Building. We are deeply engaged in evaluating space requirements for research and education during the next 10-20 years based on improved models to better forecast our short and long-term space needs. This will also require a better understanding of current space utilization, including the rationale for differences in space assignments among various departments. For the immediate future, developing facilities plans for the Stanford Medicine Information and Learning Environment (SMILE) and the Stanford Institutes of Medicine will be among our highest priorities. Our facilities planning activities are being conducted within the framework of both the medical center as well as within the university. Details about this will be forthcoming during the next several months.

Clinical Programs (Adult)

In 2003 the clinical programs strategic plan activities for our adult services will be coordinated with Stanford Hospital & Clinics and will focus on:

1. The continued refinement and implementation of an effective physicians' practice management structure that is aligned with SHC;
2. The development of an effective clinical strategy with SHC to address areas of clinical excellence and patient satisfaction within the local, regional, and national areas. These will be guided by carefully constructed business plans;
3. The enhancement of translational medicine as a feature that distinguishes Stanford from other providers and medical centers.

The establishment in 2002 of the Council of Clinical Chairs represented an important initial step toward an effective and collaborative management structure for the Medical School's clinical chairs and the SHC leadership. Among the significant challenges for 2003 will be the development of management information and reporting processes that will better support informed discussions and decision-making by the Council and the development of a more streamlined and empowered management process.

While the Medical School and SHC have worked our way through some critical organizational and leadership changes during 2002, the local healthcare market continued to evolve. Among our goals for 2002 was the development of an effective market strategy to address provider and health care system consolidations in the local area. We did not meet our goal for 2002, and the local market continues to present consolidation

threats. It is critical to the success of our faculty's practice and the success of SHC that we now address this issue. Recent revisions in the structure of our professoriate and improved clinical practice management processes should prove helpful in this regard.

The recent articulation of a congruent relationship of Clinical Centers of Excellence within SHC and Institutes within the School of Medicine provides us with an opportunity to jointly develop the details of these units with a clear and shared purpose. Much remains to be done before any of these areas can be fully operational. In 2003 we will work collaboratively to further develop the specific programs within these areas, to clearly articulate their defining characteristics, to bring forward for discussion and resolution any outstanding operational or organizational issues, and to develop a comprehensive business plan for the defined units.

Clinical Programs (Pediatrics/Obstetrics)

In 2003, the clinical programs strategic plan activities for our pediatric and obstetric services will focus on two major areas:

1. The continued refinement and implementation of an effective physicians' practice organization structure;
2. The continued implementation of the programmatic priorities identified in the LPCH Strategic Plan (including the Children's Health Initiative).

During 2002, the leadership of LPCH and the School of Medicine committed to the joint development of a Faculty Physicians' Organization (FPO) for the Pediatric and Obstetric clinical services. The faculty, School and LPCH leadership have developed the operating principles as well as management and governance structures for the FPO. The goals for 2003 are to implement the governance structure and, to work with LPCH to create the requisite financial reports to guide the practice, establish FPO performance goals and incentive models, and to have the FPO assume responsibility and accountability for the success and performance of the clinical practice.

As is the case with the strategic plans for the School of Medicine and SHC, the Children's Health Initiative includes a commitment to the development of interdisciplinary and comprehensive centers that are programmatically consistent across the Medical Center. During 2003, we will be working collaboratively to prioritize these initiatives in order to bring them forward in partnership with the hospitals and maximize their potential for success, especially in translational medicine.

Academic Affairs

The revision in the Medical School's faculty structure that was achieved in 2002 was a significant accomplishment in its own right and is critical to the success of the Medical School's strategic plans. To ensure that we fully realize the long-term benefits of these changes, however, it is imperative that we actively manage their implementation.

In 2003, the strategic plan activities for academic affairs will focus on three major areas:

1. The refinement and continued management and implementation of the approved and outstanding revisions to the faculty;
2. The further refinement and implementation of an effective faculty recruitment and career mentoring programs;
3. The implementation of recommended initiatives for the recruitment and retention of under-represented minority faculty and women in medicine and science.

A key element of the strategic plan for academic affairs was the creation and promotion of a faculty that recognizes and values the activities and contributions of all of its' members, be they investigators, clinician-investigators/scholars, clinician-educators, or voluntary clinical educators. Our goal for 2003 is to manage the details of the implementation of these changes within our appointment and promotion process while also promoting and monitoring our success in achieving a true community of faculty.

In 2003, we will undertake a comprehensive review of the faculty recruitment and appointment process in order to reduce the time and effort required for successful completion of the appointment/promotion process. More specifically, we will seek to identify mechanisms and opportunities to streamline the process while also working to optimize the candidate pools. We will also continue our efforts to refine and implement effective mentoring programs for our junior faculty. Through these two related efforts we expect to become more effective in finding and recruiting the best new faculty and to be more effective in supporting their success as faculty at Stanford.

Among our greatest and continuing challenges is our ability to recruit under-represented minority faculty to Stanford and to retain and promote those under-represented minority and women faculty we do recruit. Our goals for 2003 include the development and implementation of the approved recommendations from the Dean's Task Force on Minority Faculty and the Dean's Task Force on Women in Medicine and Science.

Information Resources and Technology

During 2002 we launched a new effort within the Dean's Office in Information Resources and Technology (IRT). Under the leadership of Dr. Henry Lowe, a strategic plan has been developed, including efforts for Learning Technologies. In 2003 the IRT strategic plan activities will focus on four major areas:

1. Active participation in the continued programmatic refinement of the "Information Center" and IT infrastructure elements of the SMILE (Stanford Medicine Information and Learning Environment) project;
2. The development of collaborative relationships and projects within the University and the hospitals (this includes meeting the HIPAA requirements and developing an informatics infrastructure for the new Clinical Cancer Center);
3. The continued definition and implementation of critical IT infrastructure improvements;
4. The continued implementation of the IRT organization structure and governance.

The role of IRT in the SMILE project is critical. Our goals for 2003 include the development of clear and affordable programs for the Information Center and Learning Technologies and the development of specifications for the facility's IT infrastructure. These will be particularly challenging goals in light of the rapid pace of change in all three of these areas.

A major strategic initiative within the IRT plan is the development of effective collaborative relationships with our IT partners across campus and in our affiliated hospitals. In 2003, we will establish with the University and SHC a joint IT planning group. We will also begin, in partnership with SHC to develop an informatics infrastructure to support the needs of the new Clinical Cancer Center. We will also pursue an "Integrated Advanced Information Management Systems (IAIMS)" grant from the National Library of Medicine. And we will work with SHC to develop a single Clinical Research Data Repository.

The Medical School's IT infrastructure needs are large. In 2003, we will continue the phased implementation of the School's secure wireless network, we will complete the development and implementation of a secure data center for the Medical School, and we will develop a conceptual model and architecture for a new Medical School public website. In addition, April 2003 is the deadline for compliance with the new federal HIPAA privacy regulations and we will be working to meet this deadline and to ensure ongoing improvements in the School's overall data security infrastructure.

We also hope to complete the recruitment of a new Library Director early in 2003. We will then quickly pursue the development of a strategic plan for the Medical School's Information Center.

Finance and Administration

The essence of the Finance and Administration strategic plan is the provision of service to faculty and students. Through effective and collaborative partnerships with the School's faculty and students and the staff of the University and our affiliated hospitals, the School's staff seeks to support the pursuit of excellence and innovation in education, patient care, and research. In 2003, the Finance and Administration strategic plan activities for will focus on four major areas: Funds Flow, Resource Allocation, Organizational Structure, and Staff Development.

The Finance and Administration strategic plan commits to the review and revision/rationalization of current funds flow mechanisms between the School of Medicine, and the University (the "formula"), between the School and its affiliated hospitals (SHC and LPCH), and between the Dean's Office and the School's academic units (the Operating Budget formula). Our objectives are to ensure the alignment of these methodologies with the School's mission and priorities and with the costs or values of the underlying transactions. Our goals for 2003 include the completion and implementation of the current Operating Budget reformulation project and the implementation of the revised University formula model. We are also committed to work with the Hospitals in 2003 to clarify and, if necessary, revise the funds flows between our organizations.

Improvements in the allocation of resources will be achieved through two significant continuing initiatives. In 2003, we will bring forward a Medical Center Long-Range Development Plan that will provide the University, the School of Medicine and the Hospitals with the land use strategies and facilities that are required to support our strategic plan. In addition, with the creation in 2002 of the Office of Institutional Planning a locus was established for coordinating the School's planning activities with those of the School's academic units. Our goal for 2003 is to implement the departmental planning process, including its application to the School's non-departmental units.

Critical to the success of the School's translational research and medicine vision will be an ability to create and support an adaptive organization, one that is able to accommodate an increasing array of formal and informal cross-disciplinary arrangements of varying durations. Our goal for 2003 is to create the criteria, nomenclature, and process for the establishment and recognition of non-departmental academic units, to define their associated program and administrative responsibilities, and to allocate the appropriate resources to them.

The administrative work processes of the School are greatly influenced by the University. The workload impacts on School staff of new University financial and information systems have been profound and have severely limited our ability to support effectively the School's on-going mission-based activities. Our goals for 2003 are to realign our administrative processes and models in order to better support our missions and use our resources. To that end, we will develop management information systems appropriate to the School's administrative model, evaluate and adapt the School's administrative model to the fixed requirements of University systems, engage the University in an evaluation of University-wide work processes, and initiate a process to evaluate periodically the School's administrative model.

Fundamental to the success of the School's strategic plan and its many associated initiatives will be the continued support of a well-trained and motivated staff. The Finance and Administration strategic plan promotes a coordinated set of staff training and development initiatives through which this essential staff support will be ensured. Among the most critical of these slated for 2003 are the implementation of the School's Management Training Program, the enhanced representation of School staff on University and School committees, the full implementation of the new Staff Seminar Series, and development of improved rewards and incentives mechanisms.

Advocacy, Public Policy and Philanthropy

The strategic plan for the Medical School's Advocacy, Public Policy and Philanthropy programs is focused on the articulation of a positive and progressive identity for the Medical School consistent with its strategic vision as a research-intensive medical school promoting the translation of discoveries.

In 2003, the Medical School will focus its strategic activities in three areas:

1. The implementation of a comprehensive and effective communications strategy appropriate to the School's mission;
2. The development and implementation of a Medical School-based government relations program;
3. The further refinement of and preparation for a major development campaign encompassing the School's strategic needs in conjunction with Stanford Hospital & Clinics, the Lucile Packard Children's Hospital, and the University.

The implementation of a comprehensive and effective communications strategy appropriate to the School's mission and role in the reformation of academic medicine will be essential to the success of our major strategic planning initiatives. Our goal for 2003 is to refine our message and define the means by which it is regularly communicated.

In order to actively engage the public to foster an appreciation for the importance of academic medicine to the health of the community and the nation, a Government Relations position was created within the Dean's Office. This position will soon be filled. Our goal for 2003 is, through this position, to develop jointly with the University and our hospitals a coordinated program of government relations that will reinforce the role of the Medical School as an active and engaged asset to the local and national community.

The successful pursuit of the Medical School's strategic plans and other program needs must be supported with substantial development. Throughout this process, the Medical School, the University, and the Hospitals have been actively engaged in the definition of the elements for a comprehensive and effective campaign. Our goal for 2003 is to continue these discussions, leading to the announcement in 2004 of a campaign.

In Summary

While we have made progress in 2002, much remains to be accomplished in 2003 and beyond. Indeed, the plans we are constructing will help shape Stanford Medicine for the next decades. While planning is important, it cannot replace the excellence of the work accomplished by our students, faculty and staff. Your individual efforts and successes, together with an alignment of our goals and mission, can truly make a difference. In the end, the work done by each member of our Stanford community will determine our future. I look forward to continuing to work with each of you to achieve both individual and collective goals and objectives.

Leadership Changes

- **Dr. Minx (Margaret T.) Fuller**, Professor of Developmental Biology and of Genetics, has become the Chair of the Department of Developmental Biology beginning January 1, 2003. Dr. Fuller has been a member of the Stanford faculty since 1980. Her research has focused on the regulation of stem cell behavior and on how the developmental program remodel fundamental cellular functions like the cell cycle, the cytoskeleton, and the general transcription machinery to give rise to specialized cell types during cellular differentiation. I am very pleased to welcome Dr. Fuller as a new Department Chair.

I also want to take this opportunity to thank Dr. Roel Nusse who stepped down as Chair of Developmental Biology. He did a wonderful job for the Department and for the School and it has been a true privilege to work with him.

Dean's Newsletter

January 20, 2003

Update on Medical Education

During the past months considerable activity has been underway on the School of our Medical Education Curriculum. This important effort has been lead by Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, with enormous help and contributions from numerous faculty, students and staff. As you will recall, the fundamental underpinning of the curriculum restructuring has been to develop a new path for training future physician-scholars and leaders. Central to the restructuring is the creation of ***Scholarly Concentrations***, which will “define an area of academic focus within the overall medical school curriculum that provides an opportunity for students to engage in an in-depth study of an area pertinent for the practice or science of medicine and to develop analytical skills required for the critical evaluation of the scientific literature. As part of this program, students will engage in an original project or creative endeavor...”

Dr. Parsonnet presented the Request for Proposals for Scholarly Concentrations to the Medical School Faculty Senate on Wednesday January 15th and received both enthusiasm and unanimous approval to proceed. Accordingly, the RFP is now being sent to all Medical School Faculty with the goal of receiving “Letters of Intent” by February 7th and then full proposals by April 1st. Final decisions will be made by the Scholarly Concentration Committee by April 30th. This time frame will enable this exciting new program to be initiated in the Fall of 2003 for the next incoming class.

As described in the RFP, possible areas of scholarly concentration include, but are not limited to: Molecular and Genetic Medicine; Bioengineering; Community and Public Service Medicine; Health Services, Outcomes and Policy Research; Infectious Diseases and Microbiology; Medical Humanities and Ethics. Within each scholarly concentration, students can elect to pursue an original research option or an investigative scholarly option.

- In the ***Original Research Scholarly Concentration Option*** students must complete the course requirements of the concentration, participate with graduate students in the research seminar program of the relevant department or consortium, and engage in an original research project directed by a member of the concentration faculty. Research projects will be reviewed and approved by a thesis committee. For some concentrations, additional work that would fulfill the requirements of a Masters degree may also be proposed. Students electing the

Original Research Scholarly Concentration Option will ordinarily complete both the requirements of a regular medical school curriculum and the research component of the concentration in a minimum of five years.

- In the *Investigative Scholarly Concentration Option* students will fulfill the requirements by completing the designated concentration course requirements and by an independent study culminating in a scholarly paper that pertains to an original question developed by the student but that need not involve the collection of original data. Students who select the *Investigative Scholarly Concentration Option* can ordinarily complete both the standard medical school curriculum and the requirements of their elected concentration within four years if they so desire.

In parallel with the creation of the Scholarly Concentrations, the curriculum restructuring also addresses revising the traditionally dichotomized pre-clinical and clinical curriculum to one that includes parallel learning of both basic and clinical science and medicine throughout medical school. This requires redefining the essential knowledge that students require during their first and second years along with determining which basic science courses or mini-courses are better taught during the time when students are doing their clinical rotations. This restructuring also permits the creation of the necessary time-blocks to enable the Scholarly Concentrations to be successfully conducted.

In order to make the necessary changes for the class entering in the Fall of 2003, considerable work, accommodation and compromise is needed by faculty, students and staff. To a great degree this is being accomplished by the very successful partnership that has been forged between the Dean's Office and the Faculty Senate. I want to particularly thank Dr. Oscar Salvatierra, Chair of the Faculty Senate, and Dr. Ted Sectish, Chair of the Committee on Courses and Curriculum, whose leadership has been instrumental in assuring that the curriculum agenda stays on schedule. In addition, I want to also thank Dr. Neil Gesundheit, Associate Dean of Medical Education and Betsy Moreno, Office of Academic Research, for their major efforts. I also want to thank Dr. Gary Schoolnick and the members of the Scholarly Concentration Committee for their impressive work. Although much remains to be done, the work that has been accomplished to date is enormously gratifying and will serve well future generations of Stanford medical students.

Update on Education Facilities

In addition to curriculum restructuring, considerable work has also been underway in the planning for new education facilities and for the renovation of existing ones. The following update has been prepared by Maggie Saunders, Education Programmer/Project Planner in our Office of Facilities Planning and Management.

Stanford Medicine Information and Learning Environment (SMILE)

The Programming and Feasibility Phase of the SMILE project is fully underway. Initial discussions and planning have been initiated in each of the major program areas including: Learning Environments, Information Center (Lane Library), Office of Student

Affairs, Student Life, Conference Center, and Dean's Offices. Additionally, exciting discussions have emerged related to the creation of an Immersive Learning Center, which would provide a hub for the integration of state of the art simulation technologies into the teaching and learning of clinical skills.

The focus of the current effort is to understand the types, number and relationship of spaces that would accomplish the goals of each of these program elements. Parallel to the programming effort, a second set of activities has been initiated to understand the engineering and site complexities of the current SMILE site located where Fairchild Auditorium is today (to be demolished and then replaced in SMILE) and southwest of Fairchild Science Building (currently a parking lot) in terms of the evolving program information. The combined result of these efforts will be the first and most preliminary definition of a building complex and a cost estimate. These two preliminary phases are anticipated to be completed sometime in April. An update is planned for a future Town Hall meeting. In the meantime, the Office of Facilities Planning and Management is eager to receive your thoughts and ideas. Please communicate your ideas to Maggie Saunders, madaca@stanford.edu.

Fleischmann Lab Renovation

The Fleischmann Lab renovation project is also progressing as planned. Construction drawings are complete and initial bids, which are within range, have been returned. In addition, technology specifications, furniture selection, and project schedule are being refined. Demolition of the current teaching labs is scheduled to begin May 15th with project completion planned for early September.

A primary goal of the renovation is to enable the Fleischmann Labs to be more flexible and technology-capable spaces. To accomplish this goal additional electrical service will be provided in the floors of the Labs. To complete this electrical work and to enable the installation of new technologies in the M-Wing classrooms in the Alway building, the classrooms (with exception of M104) will also be pulled out of operation during the summer of 2003, beginning June 16 through end of August. An announcement has been distributed to the course directors, faculty and staff that we anticipate will be effected during the Spring and Summer terms. Primary surge space for courses and events taught during the summer term will be in the Herrin Lab building on main campus. A few larger events are being accommodated in other main campus facilities. Meetings with individual course directors are underway to accommodate the Spring courses taught in the Fleischmann Labs that will be disrupted from May 15 - June 13. Should you have any questions about this project or surge space for your course or event, please contact Maggie Saunders, madaca@stanford.edu or Linda Gibson, lindah@stanford.edu.

Responsible Conduct in Clinical Research

Thanks to the efforts of Dr. Ellen Porzig, Associate Dean for Graduate Education, Dr. Mildred Cho, Senior Research Scholar, Center for Biomedical Ethics, and Michael Cowan, Associate Dean for Post-Doctoral Affairs, an important course for graduate students and post-doctoral scholars entitled "Responsible Conduct of Research"

commenced on January 8th and extends through March 5th. Held on Wednesday evenings at 5:30 PM, in the Fairchild Auditorium, the course features presentations on scientific conduct, misconduct and mentorship; scientific record keeping; authorship, intellectual property and peer review; conflict of commitment, conflict of interest and relationships with industry; use of human subjects; social responsibility of biomedical scientists; and vertebrate animals in research.

This is an important program because it emphasizes our School's institutional commitment to fostering an environment that values scientific integrity. Indeed, as a community of scholars we are responsible not only for our individual actions but also for how they impact on and can be affected by the actions of others. Thus the interrelationship between integrity at the individual and at the institutional level is critically important. So too is the recognition that integrity in science is on a continuum with our personal and professional lives. Indeed, it is hard if not impossible to separate them. In 2002, the Institute of Medicine of the National Academies published an important monograph entitled ***Integrity in Scientific Research: Creating an Environment that Promotes Responsible Conduct.*** I would encourage you to read this monograph, which can be accessed at www.nap.edu

The cover of the aforementioned monograph contains a quotation that I believe accurately captures the essence of scientific integrity: “*Many people say that it is the intellect which makes a great scientist. They are wrong; it is character.*” – Albert Einstein.

When Does Clinical Care Become Research?

There can sometimes be a blur between clinical care and clinical research. This has important implications for deciding when approval from the Institutional Review Board should be sought before initiating a project or inquiry. The following information is provided by Vicki Jones with input from Kathy McClland and Dr. Ann Arvin.

"Clinical Research"--Gray Matters

Investigators, both junior and senior, need to be aware that Institutional Review Board (IRB) review and approval must be obtained **prior** to collecting and analyzing patient data for purposes of research. These activities are different from the clinical care of the individual patient, even though the same clinical information may be used for research purposes. A lack of understanding of the human subjects regulations and what constitutes human subjects research can lead to violations of Stanford policy and federal regulations.

The IRB offers the following advice and information to assist investigators with their obligations to comply with Stanford's requirements for the protection of human research subjects. Stanford's Human Subjects Manual (<http://humansubjects.stanford.edu/manual/>) states that research activities involving human subjects must be reviewed by a Human Subjects Panel (part of the IRB). To determine if an activity involves human subjects research, ask yourself:

1. *Are human subjects involved in any aspect of the activity?*

2. *Is this activity direct clinical care of an individual patient only, or is it a research analysis of data from this and other patients?*
3. *Is the activity within Stanford's jurisdiction?*

Whether an activity represents research may fall into a gray area. What starts out as basic medical practice designed to help an individual patient can gradually develop into a systematic investigation to improve the quality of care for a small group of patients, and ultimately turn into a full research project intended to produce a significant body of sharable, transmittable, publishable data. The purpose of medical or behavioral practice is to provide diagnosis, preventive treatment or therapy to particular individuals. By contrast, the term *research* designates an activity designed to test an hypothesis, permit conclusions to be drawn, and thereby to develop or contribute to generalizable knowledge (expressed, for example, in theories, principles, and statements of relationships). Research is usually described in a formal protocol that sets forth an objective and a set of procedures designed to reach that objective.

The following case study is offered to assist answering the question: *When does clinical practice end and "research" begin?*

Dr. Smith notices what he believes is a correlation between a patient's symptoms when on a relatively new prescription medicine and a food supplement some of his patients are taking. Dr. Smith asks a Resident to search the medical records of his patients to identify those who have both been prescribed the new medication and who have complained of certain symptoms. *Does this constitute research that requires IRB approval?*

The Resident's review of the files nets about 15 records. Dr. Smith then asks the Resident to contact those patients and ask them if they have ever taken the food supplement in question. *Does this constitute research that requires IRB approval?*

The patient information gathered by the Resident points to a strong statistical correlation between taking the prescription medication and the food supplement concurrently, and the symptoms observed by Dr. Smith, even in the small group of patients contacted. Dr. Smith then asks some of his colleagues to review the records of their patients who have been prescribed the medication and to keep track of their symptoms and dietary supplements. ***Is this research that requires IRB approval?***

Research, as officially defined by the Department of Health and Human Services http://humansubjects/manual/chapters/ch6_1_review_pro.html is: *...a systematic investigation, including research development, testing, and evaluation, **designed** to develop or contribute to generalizable knowledge.* So, whether an activity is research, becomes a matter of **intent**. At the point where Dr. Smith discovers a correlation that might *develop or contribute to generalizable knowledge*, his efforts become research-oriented. It may be that the investigation commenced with the idea of helping Dr. Smith's individual patients, but somewhere along the line Dr. Smith decided to explore the correlation further with the possible intent of contributing to general medical knowledge.

Therefore, when Dr. Smith asked the Resident to review the medical charts, if his intent was to analyze the data and eventually publish the results or use them in a larger, formal investigation, then this was research requiring IRB approval. If, on the other hand, Dr. Smith's intent was simply to help his own patients, then his actions were part of clinical practice.

The purpose of medical or behavioral practice is to provide diagnosis, preventative treatment, or therapy; and interventions are designed solely to enhance the well being of the individual patient or client. Research constitutes activities designed to contribute to general knowledge. Once a study begins, new relationships are created. Patients become subjects, doctors become researchers, students, as subjects, become respondents. The line between practice and research is often a blurred one, and confusion can arise on the part of the investigator, as well as the subject. It is the responsibility of the investigator to understand and maintain the distinction between practice and research and to inform study participants of their role as research subjects versus their role as patients.

The most efficient solution at every step of the *Dr. Smith* scenario described above would have been: *When in doubt, ask the IRB*. The IRB, in the Research Compliance Office, is available to answer questions concerning the use of research subjects and to help investigators submit research protocols for IRB approval. Stanford has four IRBs that each meet monthly to review protocols covering all aspects of human subjects research. For general information and assistance related to Human Subjects in Medical Research, please visit the Human Subjects web site <http://www.stanford.edu/dept/DoR/hs/>. For answers to questions, contact Jon Schwaiger (Jon.Schwaiger@Stanford.edu or 650-723-0082). For general information and assistance related to Human Subjects in Non-Medical Research, please visit the web site and then contact Juli Espinoza (Juli.Espinoza@Stanford.edu or 650-723-4526) concerning any questions

Inauguration of the Stanford Medicine National Advisory Council

I am pleased to announce the inauguration of the Stanford University School of Medicine's National Advisory Council. Given the many changes impacting academic health centers, it is imperative that the School and University periodically assess its strategic initiatives and direction. The School of Medicine's National Advisory Council will meet annually to review School-wide initiatives and strategic plans, including future programs and capital development. The NAC will report its findings and recommendations to the Dean and the Provost. The following list includes the individuals who have agreed to serve on this new Council:

Edward Benz, M.D.
President
Dana Farber Cancer Institute
Harvard Medical School

Elizabeth Blackburn, Ph.D.
Professor, Department of Biochemistry &
Biophysics
University of California, San Francisco

Thomas F. Boat, M.D.

Mr. William A. Halter

Professor and Chair, Dept of Pediatrics
Children's Hospital Medical Center
Cincinnati, OH

Stanford University, Board of Trustees
Washington, D.C.

Donald A.B. Lindberg MD
Director, National Library of Medicine
National Institutes of Health

David Satcher, M.D., Ph.D.
Director, National Center for Primary
Care
Morehouse School of Medicine

Susan Lindquist, Ph.D.
Director, Whitehead Institute
Massachusetts Institute of Technology

Carla Shatz, Ph.D.
Professor and Chair, Department of
Neurobiology
Harvard Medical School

Daniel H. Lowenstein, M.D.
Professor of Neurology
Department of Neurology
University of California, San Francisco

Samuel A. Wells, Jr., M.D.
Department of Surgery
Duke University Medical Center School
of Medicine

William A. Peck, M.D.
Dean, School of Medicine
Washington University

I am enormously pleased by the quality and depth of the individuals who have agreed to serve on this Council. They represent a breadth of knowledge and expertise that spans the School of Medicine's missions in education, research, patient care and community service.

We are planning our first meeting of the National Advisory Council for November 2003.

Congratulations

- **Dr. Stanley Falkow:** This past week, the National Academy of Sciences (NAS) has selected 18 individuals to receive awards honoring their outstanding scientific achievements. Among these is Dr. Stanley Falkow, Professor of Microbiology and Immunology, who will receive the **Selman A. Waksman Award** "for his many contributions to understanding the mechanisms by which bacteria cause infection and disease." The award is supported by the Foundation for Microbiology and has been presented since 1968. Congratulations to Dr. Falkow.
- **Dr. Carlos Esquivel:** The Northern California Chapter of the American Liver Foundation will honor Dr. Carlos Esquivel for his outstanding contribution to biotechnology and medical innovation at a gala event in San Francisco in March. Congratulations Dr. Esquivel.
- **Stanford Medical Center** has received among the highest scores in California on the first comprehensive report on hospital performance publicly released by a health plan. The Pacificare Quality Index, released this past week, evaluated 200 California hospitals on more than 60 measures of quality and affordability.

Stanford achieved an overall quality score of 95%, with an overall patient safety score of 98%. Given the complexity of the cases cared for at Stanford, these results are excellent and compare favorably to other academic medical centers (e.g., UCSF Medical Center had a score of 79% and UCLA Medical Center scored 58%). While these are gratifying, by all accounts considerable work remains in further improving the quality of patient satisfaction at Stanford – a matter that is high on the priority list of hospital leaders.

Announcements

2nd School of Medicine HIPAA Public Forum to Focus on Research

The second in the series of HIPAA Public Forums sponsored by the School of Medicine is slated for Wednesday, January 29 from 1:00pm – 2:30pm in Fairchild Auditorium.

In response to many requests for more information regarding the HIPAA privacy rules and research, this Forum will focus on research compliance and the impact of the new HIPAA regulations. A panel representing HIPAA staff from the School, Hospitals, and University will provide the most current information regarding Stanford research policies, answer faculty and staff questions, and solicit input for future training needs. Investigators and research staff are encouraged to attend.

Due to space limitations, participants are asked to pre-register for this event by using the following link: <http://reggie.stanford.edu/SignupForm1.asp?670>

Prior to the Forum, participants are encouraged to submit questions they would like the panel to address. Please submit general questions and common concerns to HIPAA@med.stanford.edu.

Stanford University Minority Medical Alliance's (SUMMA) Twelfth Annual Premedical Conference

As you probably already know, SUMMA is a coalition of African American, Latino, and Native American medical students committed to recruiting and retaining underrepresented medical professionals. Every year, SUMMA hosts the largest minority premedical conference on the west coast, typically drawing 400-600 attendees each year. The goal of the conference is to increase the number of minority applicants to the health professional fields so that we can better serve our communities.

Our opening speeches begin at 8 a.m., with the conference ending at 4:30 p.m. In line with our goal of increasing the numbers of underrepresented minorities in medical school, SUMMA will focus on the pre-medical process by providing workshops targeted at specific aspects of the application process, a newly revamped booklet with 65 pages of facts, advice, and tips, and invaluable interaction with medical students, physicians, and recruiters from around the country.

Please join us on Saturday, February 1, 2003 at Fairchild Auditorium. Further details about this exciting event can be found at: <http://www-med.stanford.edu/osa/summa>

Appointments and Promotions

- Craig T. Albanese has appointed to Professor of Surgery at the Lucile Salter Packard Children's Hospital and Professor, by courtesy, of Pediatrics at the Lucile Salter Packard Children's Hospital and Professor, by courtesy, of Obstetrics and Gynecology at the Stanford University Medical Center, effective 1/1/2003 to 12/31/2007.
- Natalie Rasgon has been appointed to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 1/1/2003 to 12/31/2007.

Dean's Newsletter February 3, 2003

Strategic Planning Retreat 2003

From January 30th to February 2nd some 76 members of the School of Medicine and Medical Center gathered at the Carmel Valley Ranch for the Strategic Planning Retreat 2003. Attendees included basic and clinical science department chairs, senior deans, faculty leaders, students and postdoctoral scholars, alumni, hospital CEO's and their strategic planning staff, university representatives and trustees. Although the group was diverse, it became united in seeking how to make Stanford University School of Medicine a transforming agent for academic medicine. It is, of course, difficult to capture the excitement and enthusiasm that emerged at the Retreat for those who were not in attendance. However, it is our hope that we can engage and enlist as many of you as possible in the new bold vision we believe is emerging for Stanford Medicine.

Last year's Strategic Planning Retreat in February 2002 (my first at Stanford) laid out the rough outlines of our agenda. Recognizing the interrelatedness of our core missions, Work Groups of faculty, students and staff, each lead by a Senior Associate Dean, had carried out critical reviews and analyses in key areas of the School. These were: medical student education; graduate student education; postdoctoral scholar training; research; clinical care; the professoriate; finance and administration; advocacy; communication; government relations and philanthropy. We came to the 2002 Retreat with over a hundred strategic initiatives and emerged with a core mission and a more defined set of goals. Our defined mission is *to be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovations in patient care, education and research*. Our overarching goals included:

- To become a leader in the movement to reform and rejuvenate the education and career development of biomedical innovators;

- To transform the future of biomedical, translational, clinical research and education by fostering novel collaborative alignments between basic and clinical scientists, clinicians, and educators throughout the University, as well as with public and private partners worldwide;
- To earn the public's trust and respect as a premier medical school through outstanding patient care and academic medicine.

During the past year, considerable progress has been initiated in each of our mission critical areas. Some of these were codified in the end-of-the-year summary included in the December 16, 2002 issue of the Dean's Newsletter (<http://deansnewsletter.stanford.edu/>). Further, we recently published and distributed the first draft of our strategic plan and objectives in "Translating Discoveries," which is also available at (<http://medstrategicplan.stanford.edu/>). In addition, in the January 6, 2003 Dean's Newsletter (<http://deansnewsletter.stanford.edu/>), I summarized our objectives for 2003.

While our goals and their implementation are key to our success, even more important is our ability to come together and work closely as a community committed to each other and to the future of Stanford Medicine. Of course this is a difficult challenge given the many demands and economic forces affecting academic medical centers and their various internal and external communities. Traditionally, it is not infrequent that fracture lines develop among basic science, clinical science and clinical care communities. Indeed, it is well recognized that this has been true at Stanford in the past and that there is still very much the perception that these communities are not well aligned today. I fully recognize the important and unique differences that apply to each group, but I am also cognizant of their inextricable interrelatedness. More importantly, it is clear that alignment is critical if our "sum is to be greater than the whole of our parts" or, put another way, if we are to achieve the excellence we are capable of as an academic medical center and, even more importantly, to serve as a role model among research-intensive schools of medicine.

I felt that the 2002 Retreat helped to build some new bridges between our various communities based on improved understanding of how intertwined our communities truly are – and how they are each important to achieving our overarching goal of "translating discoveries". While this spirit has been sustained during the past year, it is of course fragile and requires frequent reinvigoration. The 2003 Strategic Planning Retreat held at the end of last week helped secure and significantly amplify our alignment and commitment to changing the "culture of medicine" and to working together so that Stanford could transform the future of academic medicine. I will not attempt in this report to review each element of the Retreat but will focus on some of the most important interlocking highlights and conclusions that we reached. We will post the presentations from the Retreat on the website (<http://medstrategicplan.stanford.edu/>) and will hold a Town Hall Meeting on Tuesday, February 18th at 5:30 p.m. to discuss the outcomes of the Retreat further. Perhaps most importantly, I hope that each department chair, faculty, student and staff leader will give an update on the Retreat to her or his department, group or constituency.

Following are some selected highlights.

1. There was strong concurrence that the **curriculum changes** being led by Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, and her colleagues are important, exciting and transformational. The intersections between programs training future physician leaders and scholars and those training graduate students were highlighted, and efforts to develop shared opportunities (e.g., a joint medical and graduate student “pre-differentiation experience”) were discussed with considerable enthusiasm.
2. There was considerable appreciation for the changes that have already taken place for **graduate students and postdoctoral scholars** that was presented by Dr. James Nelson, Senior Associate Dean for Graduate Education and Postdoctoral Affairs. However, there was a recognition that much greater inclusion of residents and clinical fellows into the curriculum and under the broader umbrella of the School was important – and should be a major goal for this next year. A committee led by Drs. Charles Prober and Larry Shuer has recently been appointed to address how to better engage residents and clinical fellows into the missions of the School. This committee will provide at least an introduction to this important initiative.
3. There was praise for the changes that have occurred during this past year in the **professoriate** lead by Dr. David Stevenson, Senior Associate Dean for Academic Affairs and his colleagues. The more functional characterization of faculty roles and expectations for appointment and promotion was especially noted. In addition, the recent and unanimous support of the University Faculty Senate to grant PI-status to MCL faculty was especially appreciated as an important step to better aligning faculty groups and dissipating the perception of “second-class status” for our clinician investigator scholar community. An important objective for 2003 is to more fully develop the role of the “clinician-educator” as an important member of the medical center team and to do our best to clarify the important role and nomenclature for our “voluntary clinical educator faculty”. In addition, and in recognition of the value the School is placing on interdisciplinary team-based efforts, a strong plea was made to address the promotion criteria to better acknowledge and reward such important efforts – something that should be done over this next year.
4. There was recognition that our plans for the School of Medicine are closely linked to the future success of the **clinical programs** of our major affiliated hospitals, especially Stanford Hospital & Clinics (SHC) and the Lucile Packard Children’s Hospital (LPCH) as well as the Palo Alto VA Hospital and the Santa Clara Valley Medical Center. Dr. Ken Cox, Senior Associate Dean for Pediatric and Obstetric Clinical Affairs presented a report on the clinical programs at LPCH, which was followed by comments from Chris Dawes, CEO for LPCH. The strategic plan for LPCH is reasonably well developed. It focuses on the delivery of outstanding tertiary and quaternary care along with continuing to service to its communities

for primary and secondary care. A number of partnerships with LPCH and community hospitals and practices have been established over the past decade that will be sustained and enhanced in the coming years. The importance of alignment of the physicians and the hospital in carrying for these missions is essential, and Dr. Cox reviewed the progress to date in developing a faculty practice organization that is part of a “physician-hospital” structure. Implementation of this organization during the next months is one of the highest priorities. At the same time, the success of clinical programs at LPCH has now put an enormous strain on its bed resources, and one of the most significant objectives before LPCH is the creation of additional bed capacity both on and off the medical center footprint. These important needs are being captured and developed as part of a long-range medical center facilities planning effort. This will be an important topic for discussion during the next several months.

5. Together with the new leadership at SHC being developed by Martha Marsh, CEO, the important clinical strategic objectives for **enhancing adult patient care** were reviewed by Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs. Central to this effort is improving the position of SHC as a “value leader” whose expertise is both concentrated in certain areas (e.g., cancer, cardiovascular, neuroscience, transplantation) and broad in secondary care delivery. While considerable attention has focused in the past on inpatient services, much more effort is needed to develop ambulatory services both within the SHC complex and off-site in the community. One of the overarching needs is to expand the depth and “market-share” of clinical services; this will require an expanded clinical workforce. Important to this effort will be clarification and enhancement of the role of clinician-educators. In tandem with this will be the formation of strategic partnerships with community hospitals and physician groups, which will be coupled with efforts to improve patient care services at SHC. The value of translational medicine in further distinguishing SHC and LPCH from its competitors in the community was highlighted repeatedly. This further underscored the benefits of a close partnership and association with the School of Medicine, SHC and LPCH. Important to this goal is a transparent and close working relationship among Hospital and School leaders, and it was pointed out repeatedly that this seems to be working successfully with the current Dean and CEOs. Such collaborations will also need to extend to new ways of organizing our clinical care and research interface. The creation of the Stanford Institutes of Medicine will be one means for bringing basic research, translational medicine and clinical care under overarching umbrellas. While we have announced one such effort in Cancer/Stem Cell Biology and Medicine, we are also envisioning a small number of additional Institutes that align our communities in mutually important topics such as cardiovascular medicine, neuroscience, immunology and infectious diseases. We also can envision the development of additional interdepartmental clinical centers (e.g., vascular center) to provide a more seamless interface to the patients we serve and the care we deliver.

6. **Translating Research and Medicine** was among the key conclusions and derivatives of the 2002 Strategic Planning Retreat. To further our discussion of this vitally important topic, Senior Associate Deans for Research John Boothroyd and Harry Greenberg organized a panel discussion that touched on a range of topics related to translational and interdisciplinary research. These included updates on the Children's Health Initiative, the newly announced Stanford Institute for Cancer/Stem Cell Biology and Medicine, the Bio-X/Clark Center programs and an update on the "multidisciplinary research program" supported by the Dean's Office. Among the most exciting efforts was the initiative started by Drs. Judy Swain, Chair of Medicine, and Lucy Shapiro, Director of the Beckman Center. Following last year's retreat, they created a cooperative effort to jointly fund and support interdisciplinary projects involving collaborations between physician-investigators and basic and/or applied scientists. This very exciting project is not only valuable in its own right; it also demonstrates how faculty leaders and departments can use their creativity, energy and resources to further our shared vision for "translating discoveries". Another important facet of this presentation was to define the resources needed to further foster translational research throughout the school – including support personnel and informational technologies. While it is recognized and understood that great fundamental basic research will always be the distinguishing feature of Stanford, it is also clear that translational research will help to unify our communities and enable us to bring forth knowledge from the laboratory to help benefit our adult and pediatric patients.
7. At last year's retreat, the only area in which a report was not presented was in **Information Resources and Technology (IRT)**. With the appointment ten months ago of Dr. Henry Lowe as Senior Associate Dean for IRT, a bold and exciting plan for state-of-the-art information resources at Stanford has been developed. This plan was outlined by Dr. Lowe. It is closely linked to our efforts in education, research, clinical care, community outreach – and virtually everything else that will enable us to be successful. Accomplishing this will require enormous coordination and cooperation between the School, Departments, Hospitals and University. These technologies will be expensive but there is the opportunity to develop strategic partnerships with community leaders. The goals of our IRT plan include: Enabling ubiquitous access to information; assuring data privacy and security; developing our library as a "knowledge-management center"; optimally using the internet as a communications medium; innovating learning through information technologies; enhancing research through "translational informatics." In addition, we hope to develop a "clinical informatics center" at the School level to work with Departments and Institutes to develop domain-specific informatics programs with the Hospitals that would assist in the effective implementation of clinical systems. During the next year Dr. Lowe and his colleagues will work on the following projects, among others: optimize IT planning between the School and Hospitals; develop the Clinical Informatics Center; secure a wireless network for the School; plan for a clinical research data repository; further the goal of developing our library as a "knowledge-

management center”; assure the data security and compliance with HIPAA; and develop a new School Website. There was an enormous amount of enthusiasm for the plans presented by Dr. Lowe. Clearly the challenge now will be to develop the resources to achieve and implement them.

8. Bringing our ongoing and new initiatives to fruition requires optimal use of our current **financial and administrative resources** as well as the creation of new ones. Simply put, we will need considerable new dollars to support the programmatic and capital requirements that will enable Stanford Medicine to achieve the full potential we envision. At the Retreat, Mike Hindery, Senior Associate Dean for Finance and Administration, reviewed the current financial status of the School. He also discussed the various changes that have been occurring in the important funds-flow relationships between the School and the University, School and Hospitals and, within the School, between the Dean’s Office and the Departments. Each of these has historical precedents and all have various perceptions surrounding them. Mike and his colleagues have recently completed a redefinition of the formula between the School and the University, and work is underway to address the funds-flow process between the SHC and the School of Medicine. During the past year a number of important steps were taken in rationalizing the funding expectations and relations between the Dean’s office and Departments, and a review of the School’s operating budget is currently moving toward completion. While each of these carries considerable challenge and shared risks, they are all important to better defining how resources are used to support our missions in education, research and clinical care. Although each of these areas have their complexities, the important theme which emerged was an appreciation that “transparency” is a guiding principle being used by Mike Hindery and his colleagues – and that this will help us to make progress in better realizing our shared objectives.
9. Being able to achieve our goals for the future will require a renewal and further development of our physical resources. I reviewed the 10-year **facilities plan** for the School of Medicine as well as the 15-year plan, recognizing that these are closely connected to the long-term facilities master plan being developed for the Medical Center as a unit and within the University. I am particularly grateful for the important work that Ms. Nancy Tierney, Director of Facilities Planning for the School, and Mr. David O’Brien, Director of Institutional Planning, have done to help develop our long-term plans. We are also working closely with the University as part of the Science-Engineering-Medicine West Campus Plan that will unfold during the next decade. For the School the primary focus will be on our SMILE (Stanford Medicine Information and Learning Environment) project and the first of our Stanford Institutes of Medicine. Although the details of these plans are not yet available, I do believe we now have in place a strategy that will enable the School to best optimize its facilities during the next 10-15 years. Central to this is the conceptual view that we are best served by remaining physically contiguous to the Hospitals (to best ensure translational research and medicine) and to the rest of the university (to best optimize interdisciplinary

research and education). Finding the support to develop these programs and facilities is our biggest challenge – and this requires a clear alignment of our faculty with the School, Hospitals and University.

10. **Communications, Advocacy, Government Relations/Public Policy and Philanthropy** also comprised an important aspect of the Retreat. During the past year, Ritch Eich, Director of Communications and Public Affairs, and his colleagues have been developing a communication strategy for the School and Medical Center. This requires the continued refinement of our message, the development of “thought-leaders” who can represent the School and Medical Center, and improved relations with our neighbors and community – both within the University and with our neighbors locally, regionally and nationally. This will enable us to better communicate the excellence and accomplishments of the School in education, research and patient care and, through that, to better foster the public’s appreciation for the contributions of academic medical centers to the health of our community and the nation. Through this communication, we will better engage the public’s trust and support – in both the public and private sectors. I announced at the retreat that the Office of Government Relations that we planned last year has a newly appointed leader: Mr. Ryan Adesnik. Ryan will join the School as Director of Government Relations in mid-March. Of interest, Mr. Adesnik was able to attend and participate in the recent Retreat.

Of course one of the major goals of our Strategic Planning Activities will be the Campaign for Stanford Medicine – an effort we plan to begin this year. Ms. Jackie Brown, Director of the Office of Medical Development, reviewed the background for the capital plan that she has worked on with the School and Hospitals. We envision this will be an integrated campaign for Stanford Medicine and that it will also be part of the University Capital Campaign. Mr. John Feidenrich, who attended the Retreat, will be serving as the Chair of the Stanford Medicine Leadership Council. During the next months we will be enlisting volunteers for the Council and will further craft the bold vision that characterizes our efforts for the future of Stanford Medicine.

There is no question that achieving some of the goals we set last year is enormously important and that this has helped to sustain the thrust of our strategic planning. However, perhaps even more important is building the community of excellence that shares a common vision and that seeks to work collaboratively to achieve it. As the Retreat drew to a close it was clear that the leaders who were present were united. They expressed a commitment to the vision of Stanford School of Medicine and Medical Center as being the leader in the movement to reform and rejuvenate the education and career development of biomedical innovators. They were united in the goal of having Stanford transform the future of biomedical, translational and clinical research and education by fostering novel collaborative alignments between basic and clinical scientists, clinicians, and educators throughout the University as well as with public and private partners worldwide. They shared a commitment of earning and ensuring the public trust and respect for Stanford as a premier medical center that delivers outstanding

patient care and that serves as a global model among research-intensive schools of medicine.

Equally important was the commitment of these leaders to value each other for the collective future of Stanford Medicine. While there is no doubt that achieving the goals we set before us will be challenging, there is no question in my mind that we can do so if we are united and collaborative. While a number of individuals expressed the notion that this might not have been possible in the past, the unifying theme of our discussion was that it is achievable now and that we must accomplish it. I know it is hard to capture these strong sentiments in words – especially for those who were not part of the shared activity of the recent leadership Retreat. But more important than words will be our deeds, and I am confident and committed to bringing those to fruition in the months and years ahead.

I also want to thank a couple of people for making the Retreat so operationally successful. First is Ms. Sharon Olsen who worked through virtually all of the logistics and coordination. Second, is David O'Brien for all his efforts in moving our plans forward and for helping to assure that all the presentations were clear and informative. I also want to thank all the Senior Associate Deans and their staff and colleagues for developing and implementing far-reaching plans. And finally, I want to thank the Department Chairs, faculty, medical center leaders, students and staff for the time, energy and commitment that they put into the Retreat – and that I will hope they will continue to put the goal of making Stanford a truly outstanding *research-intensive medical school that improves health through leadership and collaborative discoveries and innovations in patient care, education and research*.

Congratulations

Dr. Debra Ikeda is the recipient of the Editor's Recognition Award for her significant contributions as an editorial board member of the *Journal of Women's Imaging*.

Announcements

- **Town Hall Meeting:** February 18, 2003 at 5:30 p.m. in the Fairchild Auditorium.

Dean's Newsletter
February 17, 2003

*****Town Hall Meeting Reminder*****

This is to remind you that there will be Town Hall Meeting tonight at 5:30 p.m. in the Fairchild Auditorium. If you are unable to attend, please note there will be a second meeting as follows:

- **Thursday, February 27th at Noon in the Fairchild Lobby.** Feel free to bring your lunch.

Again, the purpose of these meetings is to update faculty, staff and students of the outcomes of the recent School of Medicine Strategic Planning Retreat. You are encouraged to attend one of these meetings to gain a better understanding of the goals of the Medical School and of your important role achieving them.

Safety and Security

World events dominate our attention, and heightened security alerts have raised questions of what we, as individuals, can do to get ready for unanticipated, emergency situations. David H. Silberman, Director, Health and Safety Programs for the School of Medicine, has provided the following guidance, which is appropriate to review for any potential emergency.

The School's Health and Safety Programs Office strongly recommends a review of your department's emergency plan and your role in it. Make sure you are familiar with established procedures and emergency numbers: 286 (School), 211 (Hospital and Clinics) and 9-911 (University). Check the accuracy of telephone call lists and ensure that you know both the School's Emergency Hotline Number: 723-7233 (7BE-SAFE) and that of your department. In the event of an emergency, the School's new, paging alert system will allow us to provide information to key department staff who can pass it along via the department hotline.

It is important to emphasize preparedness over panic. We have a robust plan in place at the School of Medicine, as do the University, Hospitals and Clinics; it has been exercised in drills and in real events with positive outcomes demonstrating that we can be safe if we follow the appropriate guidelines. **It is also critically important that physicians and other members of the community participate in the disaster drills.**

Questions and concerns within the School of Medicine can be communicated to the School's Health and Safety Program's Office by email: somsafety@stanford.edu.

More About Stem Cells

With legislation now being introduced in the House and Senate to either protect or ban research on nuclear transplantation to produce human pluripotent stem cell lines (which is also referred to by the less precise and more emotionally and politically-charged names of “therapeutic cloning”, “research cloning” or “cloning for biomedical research”) it was appropriate to provide an update to the University Board of Trustees Committee on the Medical Center about our new Stanford Institute for Cancer/Stem Cell Biology and Medicine. At the Board’s recent meeting on Monday February 10th, Dr. Irv Weissman,

the Karel and Avice Beekhuis Professor of Cancer Biology and Director of the Cancer/Stem Cell Institute, and I reviewed the events that had transpired since our announcement of the Institute on December 10, 2002.

You may recall that, on the day of the announcement, international attention was focused on Stanford when an Associated Press wire story headlined that Stanford planned to “clone human embryos”. This erroneous story triggered a media eruption and rekindled the national debate over stem cell research in general and Stanford’s new Institute specifically. During the days and weeks that have followed, new articles and broadcast reports have appeared throughout the nation along with a number of editorials and Op-Ed pieces, including coverage in *Science*, *Nature* and *Nature Medicine*. Coverage in the *Wall Street Journal*, *LA Times*, *New York Times*, *Chicago Tribune*, *San Francisco Chronicle*, *San Jose Mercury News*, *Sacramento Bee* and *USA Today* were well balanced. So too were editorials and OpEd pieces in numerous national newspapers – although some pieces (e.g., *Wisconsin State Journal*, *Weekly Standard*, *Poughkeepsie Journal* and *Washington Post*) were more critical of the new Institute.

Central to the matter is the debate over whether nuclear transplantation to produce pluripotent stem cell lines is equivalent to “cloning”. We, along with the National Academies of Sciences, have indicated that the use of the word cloning is misleading and creates confusion in the public’s mind with reproductive cloning – the latter being something we believe should be banned.

We have indicated that the experiments that occur in the new Institute will follow all research guidelines, including those of the NIH, and that when research moves from preclinical to clinical studies, it will be carefully monitored by ethical oversight and institutional review. We maintain, however, that the line of inquiry that employs nuclear transplantation to study diseases like cancer is important and we very much hope it can be pursued.

For additional information regarding stem cell research and the new Institute for Cancer/Stem Cell Biology and Medicine, I refer you to the newly released Q&A section on the Medical Center’s Web Site at <http://mednews.stanford.edu/stemcell-index.html>.

Clinical Program Planning and Development

The strategic plans for both pediatric and adult patient care activities for the Medical Center were discussed and reviewed at our recent Strategic Planning Retreat on January 30-February 1st (<http://deansnewsletter.stanford.edu/>), at the Board of Directors meeting for Lucile Packard Children’s Hospital (LPCH) on February 7th, and at the Board of Directors Meeting for Stanford Hospital and Clinics (SHC) on February 14th. While there are overlapping themes, there are a number of differences between the timelines and agendas for LPCH and SHC.

Pediatric patient care agenda: During the past decade, the pediatric programs at LPCH have evolved, initially in general medical specialties and more recently in

surgical specialties and centers of excellence. The governing themes for LPCH and the Children's Health Initiative have been preeminence and sustainability. To accomplish these goals, the LPCH leadership, in collaboration with the School of Medicine and in partnership with CHI and the Lucile Packard Foundation for Children's Health, has developed a plan to focus on key areas of concentration (including newborn medicine/obstetrics [through the Johnson Center]), cardiac, cancer, pulmonary, transplantation, and brain & behavior. The past couple of years have witnessed dramatic progress in achieving or sustaining preeminence in several of these areas thanks to important new recruitments as well as the support of already extant programs. In past Newsletters, I have addressed the accomplishments achieved in the Heart Center. At the February 7th Board meeting, Dr. Michael Link, Professor of Pediatrics, gave a stellar presentation on the progress that he and his colleagues have made in bringing the LPCH/Stanford Cancer Center to preeminence in pediatric cancer care and research. Importantly, he also discussed how this pediatric program should be aligned to the future development of the Stanford Institute for Cancer/Stem Cell Biology and Medicine.

In addition to developing centers of excellence within LPCH, the Hospital and faculty have also developed an impressive regional network of satellites and joint programs in neonatology and specialty care throughout the Bay area as well as more distant sites (e.g., Oregon, Nevada, Alaska, Hawaii). This adds to the sustainability of the pediatric clinical programs and further assures that LPCH serves as both a community/regional resource as well as a referral center for children facing serious health challenges.

Also at the February 7th Board of Directors meeting, Dr. Ken Cox, Senior Associate Dean for Pediatric/Obstetric Clinical Affairs and Dr. William Feaster, gave an update on the Pediatric/Obstetric Faculty Practice Organization (FPO) that is being designed to further enhance the clinical programs by aligning the goals of the faculty, LPCH and the School of Medicine. Although the FPO will not be a new corporate entity, it is being designed so that faculty will be responsible and accountable for the financial, quality and service outcomes of the pediatric/obstetric clinical practices. The plan is to implement the FPO management and committee structures during this year and to have the FPO assume responsibility and accountability for the operations of the pediatric practice. This will include budget planning for FY04 as well as the development and implementation of an integrated statement of revenues and expenses for the practice along with performance goals and related incentive models. Clearly, it is hoped that these processes will help the pediatric practice to become more successful and, accordingly, to play an ever-important role in allowing LPCH, the School and pediatric faculty to achieve excellence in the care of patients – and in the preeminence and sustainability of pediatric programs at LPCH/Stanford.

Adult patient care agenda: At the SHC Board of Directors Meeting on February 14th, Martha Marsh, CEO, and Michael Calhoun, Vice President for Strategic Planning and

Marketing, presented an update on the Hospital's strategic plan. As with LPCH, the goal is to achieve preeminence and sustainability. To do so will require growth in the overall clinical enterprise, distinction in clinical quality overall as well as leadership in selected services, distinction in patient service and satisfaction, and a strong alignment with the School of Medicine. Although there is little doubt about the excellence of the faculty as well as clinical and professional staff at SHC, there are a number of important issues that must be addressed if sustainability and preeminence are to be assured.

Among the most significant challenges facing SHC (and other academic medical centers) is changing revenue patterns since more patients are being cared for in the ambulatory setting, requiring specific plans and objectives are required to better optimize ambulatory care delivery both at the Medical Center as well as in the community. Further, the patterns of health care payments are continuing to change based on both regional and national trends. Locally, lower-cost systems, like Kaiser, command a large portion of the patient base and offer options to employers that are attractive compared to the rising rates of health care at teaching hospitals, including Stanford. This becomes particularly problematic given a down-turned economy in which rising health insurance costs are increasingly challenging to employers. This has led to a national trend of shifting more of these costs to employees by both employers (e.g., GE has attracted national attention because of its position on this issue) as well as by insurance companies that may charge patients larger co-payments if they seek care by more expensive providers. While the health care provided by Stanford is state-of-the-art and highly innovative, both employers and employees may make decisions based on cost rather than on the perceived advantages of receiving care at Stanford or other academic medical centers. Obviously the impact of such trends has enormous consequences and ultimately will need to be addressed by national or regional reforms rather than local market force dynamics.

In addition to these challenges, SHC also faces local competition for patients and a less secure referral base than desired. Recent data shows that in-patient volumes are down compared to budget and prior year actuals, notably in some key areas (e.g., cardiovascular surgery). Addressing these changes in volume, especially in key selected services is essential, and will be the focus of upcoming meetings of the Council of Clinical Chairs. Coupled with this is the fact that overall size of SHC is small compared to peer institutions across the country, and opportunities for increasing bed capacity and ambulatory services on-site are difficult because of land-use politics as well as funding support.

Based on the dynamic changes in the health care marketplace locally and nationally, it is imperative that SHC expand its regional referral relationships and achieve a more optimized scale of inpatient and outpatient facilities for both financial and service performance. In addition to seeking excellent clinical services throughout, areas of special focus will include cancer, cardiovascular, neurosciences, transplantation. These are consonant with the already established Stanford Institute of Medicine in Cancer/Stem Cell Biology and Medicine, as well as those being considered:

Cardiovascular Institute, Neurosciences Institute and Immunology and Infectious Disease Institute. Aligning SHC, the School and LPCH in these areas will create a powerful interface that fuses basic research, translational medicine and clinical care for adults and children.

Further optimizing clinical care delivery will require facilities improvements both within the current SHC footprint as well as community based outpatient facilities. Options are currently being explored to facilitate these programs. Clearly financial limitations and competing capital demands will impact the available choices.

It is clear that the success of SHC depends on its ability to deliver outstanding clinical care in a manner that makes it an essential offering for employers and that is a hospital that is attractive to payers and to patients. This not only requires more effective hospital management and the availability of electronic data to better inform decisions, but also the increased collaboration of clinical faculty and leaders. Since the information currently available demonstrates that many of the clinical practices are busier than last year, it is likely that additional physician capacity will be needed in some key areas. This will likely require the expansion of our clinician-educator staff, especially in selected services and ambulatory sites. Assuring that our clinical staff is valued and successful is an enormously high priority for the School and the Medical Center.

Bicycle Safety on Campus

In previous Newsletters and communications I have raised serious concerns about bicycle safety on campus. This issue was also addressed by Laura Wilson, Chief of the Department of Public Safety, at a meeting of the University Faculty Senate on Thursday February 6th (see Stanford Report, February 12th). I was encouraged by the actions being taken to address the problems of students and other cyclists who fail to use lights at night or who ignore basic rules such as stop signs. Since I drive on campus virtually every night I am horrified by the numbers of students who simply cannot be seen since they have neither head or tail lights, or who proceed through stop signs without pausing for cars that may make right-hand turns.

Although Chief Wilson presented data to demonstrate that progress was being made, my informal sampling suggests that relatively few bike riders have lights at night and that a large portion still ignore stop signs or the rules of the road.

I hope that efforts to further improve bicycle safety on campus can be further accelerated. I hope that each of you who ride a bicycle on campus do so with attention to safety – and with headlights and rear lights at night. I also encourage each of us to take a more proactive role in informing riders without lights or who ignore stop signs that they are at risk for serious harm. We have a responsibility to assure that the School of Medicine serves as a role model for bicycle and health safety for the Stanford campus.

Innovations in Biomedical Research

On Saturday February 15th, the Stanford University Medical Alumni Association sponsored the first symposium for alumni, graduate students, and postdoctoral scholars in the biomedical sciences. One of the goals was to strengthen connections between graduate students and postdoctoral scholars with the School of Medicine. Since Stanford has nearly the same number of medical students as graduate students, along with a very robust program for clinical and research postdoctoral scholars, this outreach is both appropriate and welcome.

The first symposium on Innovations in Biomedical Research was also outstanding and included presentations by MD, PhD and MD/PhD degrees as well as individuals who carried out their postdoctoral training at Stanford. Included in this stellar group were:

Irv Weissman, Director of the Institute for Cancer/Stem Cell Biology and Medicine and the Karl and Avice Beekhuis Professor of Cancer Biology

Linda Giudice, Stanley McCormick Memorial Professor of Obstetrics and Gynecology

Seung Kim, Assistant Professor of Developmental Biology and of Medicine

Thomas Schall, President and CEO of ChemoCentryx, Inc

Fred Alt, Charles A. Janeway Professor of Pediatrics and Genetics, Harvard Medical School

Thea Tlsty, Professor of Pathology and Director of UCSF Center for Translational Research in Cancer, UCSF

Farhad Imam, MD/PhD Candidate at Stanford

I want to offer my thanks to Mr. Andrew Cope from the Office of Medical Development for his work arranging this symposium. Andrew could not attend this event for a very good reason – the welcoming of his new son who was born on Thursday, February 13th. I also want to thank the Organizing Committee including: Babak Alizadeh, PhD candidate and Lead Volunteer, along with Ross Bright, Michael Cowan, Mignon Fogarty, Lynette Fung, Rosalind Grymes, Grace Park and Ellen Porzig. I hope this is just the beginning of a long series of great lecture series on “Innovations in Biomedical Research”.

Congratulations to Dr. Iris Litt

On the evening of February 4th, a celebratory dinner was held to officially present Dr. Iris Litt as the new Marron and Mary Elizabeth Kendrick Professor of Pediatrics. Dr. Litt has had an enormously distinguished career in pediatrics. She is one of the founders of the field of Adolescent Medicine and has made major contributions to this field during the

past twenty-five years, focusing on the challenging problems of substance abuse, pregnancy, sexually transmitted diseases, compliance with medical therapies and eating disorders. Her work has been internationally acclaimed and she has been the recipient of numerous awards, including election to the Institute of Medicine of the National Academy of Sciences. Dr. Litt succeeds the first two incumbents of the Kendrick Professorship – Dr. Irving Schulman and Harvey Cohen – both chairs of the Department of Pediatrics. The evening was made particularly meaningful by the presence of Professor Litt's family, colleagues and friends.

Please join me in congratulating Dr. Litt as the Marron and Mary Elizabeth Kendrick Professor of Pediatrics.

Commencement Speaker 2003

It gives me great pleasure to announce that Julie Louise Gerberding, M.D., MPH, Director of the Centers for Disease Control and Prevention (CDC), will speak at this year's graduation ceremonies on the afternoon of June 14th, 2003. Dr. Gerberding is the first woman to lead the CDC at a very pivotal time as it addresses bioterrorism (notably smallpox vaccinations), global health, infectious disease, and engages in intense research efforts. She trained in the Bay Area and is an excellent speaker who has testified multiple times before Congress. Dr. Gerberding is also an Associate Clinical Professor of Medicine (Infectious Diseases) at Emory University.

As Acting Deputy Director of National Center for Infectious Diseases, Dr. Gerberding played a major role in leading CDC's response to the anthrax bioterrorism events last fall. She joined CDC in 1998 as Director, Division of Healthcare Quality Promotion, where she developed CDC's patient safety initiatives and other programs in the prevention of infections, antimicrobial resistance, and medical errors in healthcare settings. At UCSF, where she earned her MPH degree, she was Director of the Prevention Epicenter, a multidisciplinary service, teaching, and research program that focused on preventing infections in patients and their healthcare providers.

Dr. Gerberding is also a member of the Society for Healthcare Epidemiology of America (SHEA) and has served as a member of the AIDS/Tuberculosis Committee. She is currently serving her third year as Academic Counselor on the SHEA Board, and will be President of SHEA in 2003. In the past, she served as a member of NCID/CDC Board of Scientific Counselors, the CDC HIV Advisory Committee, and the Scientific Program Committee of the National Conference on Human Retroviruses. She has also been a consultant to NIH, AMA, CDC, OSHA, National AIDS Commission, US Congress OTA, and WHO.

We are privileged and honored to have Dr. Gerberding speak at Commencement, 2003.

Appointments and Promotions

- **Victor Carrion** has been reappointed as Assistant Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 2/1/2003 to 12/31/2006.
- **David Clark** has been reappointed as Assistant Professor of Anesthesia at the Palo Alto Veterans Affairs Health Care System, effective 2/1/2003 to 12/31/2006.
- **Anne Dubin** has been promoted to Associate Professor of Pediatrics (Pediatric Cardiology) at the Lucile Salter Packard Children's Hospital, effective, 2/1/03 - 1/31/08.
- **Jeffrey Feinstein** has been reappointed as Assistant Professor of Pediatrics (Pediatric Cardiology) at the Lucile Salter Packard Children's Hospital, effective 2/1/2003 to 5/31/2006.
- **Michael K. Gould** has been reappointed as Assistant Professor of Medicine (Pulmonary and Critical Care Medicine) and, by courtesy, of Health Research and Policy at the Palo Alto Veteran's Affairs Health Care System, effective 2/1/2003 to 8/31/2006.
- **Christina Mora Mangano** has been promoted to Professor of Anesthesia at the Stanford University Medical Center, effective 2/1/2003.
- **David Rosenthal** has been promoted to Associate Professor of Pediatrics (Pediatric Cardiology) at the Lucile Salter Packard Children's Hospital, effective 2/1/03-1/31/08.
- **Jennifer Raymond** has been reappointed as Assistant Professor of Neurobiology, effective 2/1/2003 to 12/31/2005.
- **Kathryn Stevens** has been appointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 2/1/03 – 1/31/06.
- **David Tong** has been promoted to Associate Professor of Neurology and Neurological Sciences and, by courtesy, of Neurosurgery at the Stanford University Medical Center, effective 2/1/03 – 1/31/08.
- **Sharon Williams** has been reappointed as Assistant Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 2/1/2003 to 12/31/2006.

Dean's Newsletter

March 3, 2003

Town Hall Meetings and Communications

In the past couple of weeks I have held two Town Hall Meetings in order to provide additional opportunities for communication and dialogue with faculty, students and staff about the many changes that are occurring at the School and Medical Center (see coverage in the February 26th issue of the Stanford Report [<http://www.stanford.edu/dept/news/report/>]). In particular, I felt it was important to have the opportunity to communicate with interested members of the community some of the events that have transpired at the Second Strategic Planning Retreat that was held on

January 30 – February 1st. If you are interested, the presentations that took place at the recent Strategic Planning Retreat are also now posted on our Web-Site (<http://medstrategicplan.stanford.edu/>).

I firmly believe that bilateral communication is essential and welcome opportunities for feedback and recommendations from you about how to help Stanford succeed in its mission of being a global role model among research-intensive schools of medicine. I view periodic town hall meetings, along with my meetings with individual departments, small informal gatherings of faculty, students and staff, the circulation of our Strategic Plan “Translating Discoveries” both in hard copy as well as on the Web-Site (<http://medstrategicplan.stanford.edu/>), and this Newsletter, as ways of sharing with you the issues or challenges that I see as important to the future of our School.

While I recognize that much of the work carried out is at the individual level of research, education and patient care, it is my hope that by being informed about the broader directions and challenges of the School, our community will feel more engaged and involved in helping to shape its destiny. I also believe that since no single form of communication is optimal, using multiple venues is best. I am naturally interested in what you think works – or doesn’t – and especially your input, comments and suggestions. Please feel free to send those to me directly.

“Envisioning the Future of Academic Health Centers”: Final Report from The Commonwealth Fund Task Force on Academic Health Centers

In February 2003, the Commonwealth Fund Task Force published its report on the future of academic health centers. The full report is available on the funds website at www.cmwf.org. I would encourage you to read the report since it contains a number of important observations. Of interest, many of the aspects of The Commonwealth Report have been captured in our independently prepared School’s Strategic Plan for the Future of Stanford Medicine – which provides at least some affirmation that we are moving down the right pathway. I am taking the liberty of abstracting some of the recommendations from the Commonwealth Fund Report’s Executive Summary. They are broken down by mission as follows:

Organization, Management and Leadership

- Academic Health Centers (AHCs) should strive to be leaders in the application of information technology to improve health care.
- AHCs should develop organizational structures that are more responsive to the needs of the communities they serve.
- AHCs should dramatically improve their internal accounting capabilities and their abilities to manage the flow of funds supporting routine activities and mission-related work.
- AHCs should develop capabilities for performance measurement and improvement, and should train and lead personnel at all levels to value openness, learning, teamwork, accountability, and patient-centeredness.

- AHCs should develop mechanisms to learn about the work of other AHCs, nonacademic health care organizations, and non-health care institutions to identify best practices that may be usefully incorporated into their own activities.
- AHCs should develop mechanisms to assess continually the health care needs of their own communities and the US population more generally, and should ensure that resulting data are incorporated into strategic planning and management decisions.

Research

- AHCs should develop rigorous, peer-reviewed, accountable procedures to allocate space, internal start-up funds, and other research resources.
- AHCs should develop interdisciplinary research structures and recruit faculty who can lead them.
- AHCs should give higher priority and recognition to new and traditionally undersupported areas of biomedical science, including behavioral science, public health-related research, informatics, management sciences, clinical research, and health services research.
- AHCs should develop the means necessary to translate results of clinical research into practice.
- AHCs should manage their relationships with industry and their research generally in a manner that protects patient participants, maintain academic values, and sustains public trust in the objectivity of the research enterprise.
- AHCs should provide increased support for and academic acknowledgement of the work of the faculty who participate in management of ethical issues in research and practice.
- AHCs should play a leadership role in ensuring that the clinical research enterprise protects the welfare and rights of human participants in clinical investigation.

Education

- The curricula of AHCs should dramatically increase emphasis on lifelong learning, teamwork, continuous improvement, and measurement of clinical performance in addition to command of biomedical information and culturally competent care.
- AHCs should develop capabilities to educate students, residents, and clinicians online and remotely.
- AHCs should develop capabilities to use simulation at all levels of the educational experience, from students' first encounters with clinical care to continuing education and certification of master clinicians.
- AHCs should train and reward educators with the same generosity as researchers and clinicians.
- AHCs should develop systems performance measurement and accountability that promote continuous improvement in education.
- AHCs should provide training to prepare clinical researchers for the challenges of an increasingly complex and accountable research environment.

- AHCs should provide leadership in training a culturally competent research workforce

Clinical Care

- AHCs should act decisively to improve safety, quality, and efficiency of the services they provide as part of a process of continual improvement in their performance.
- AHCs should invest in information technologies necessary to automate all appropriate clinical care processes, provide patients with secure access to their medical records, and help patients with self-care and medical decision-making.
- AHCs that fail to achieve the best obtainable outcomes demonstrated by peer institutions should act decisively to improve outcomes or discontinue those clinical services.

Again, I think the full report is worth reading. Given the many challenges we face at Stanford, it is helpful to know that we have recognized many of the same issues as the Commonwealth Fund Task Force and, more importantly, are well on our way to addressing many of them as well as others that we have identified as important for the future of Stanford Medicine.

Current Visa Problem for Students and Faculty

Following September 11, 2001 a number of Visa challenges have arisen for students, fellows and faculty. To better understand the implications of these changes, we invited, John Pearson, Director of the Bechtel International Center, to present an up-date on the current situation to the School's Executive Committee with respect to F and J visas. He brought three issues to the attention of the February 21st meeting of the Executive Committee that I want to share with you:

1. There will be delays in obtaining visas for the foreseeable future for students and scholars from certain countries and in certain fields. The State Department background checks for these individuals may take as long as 5-6 months, and there is no procedure available to expedite these applications.
2. Information we have always had to keep on file will now have to be submitted electronically to the Student and Exchange Visitor Information System (SEVIS). In addition, we now have to report on dependents as well, and holders of F & J visas must have full-time status.
3. There may be a change that will make getting a Social Security number contingent on having a job rather than the current situation of allowing a Social Security number if the visa holder is eligible to get a job. If this change goes through, it could make it very difficult for our international student to carry out such normal activities as renting an apartment or obtaining a driver's license. However, it is important to recognize that this last change has not yet been finalized.

Clearly, the implications and impact of these policy changes are concerning and very challenging and we are saddened by the way they affect our students and colleagues. Dealing with them is, however, difficult and complicated. Mr. Pearson expressed a willingness to be as helpful as possible and indicated that further information can be found at the International Center's web site, which is <http://icenter.stanford.edu>. The INS also has a web site as well that you may wish to consult. It is <http://www.ins.usdoj.gov/graphics/services/tempbenefits/sevp.htm>.

Update on the Medical Education Curriculum

During the past 18 months considerable progress has been made in the development of an exciting and bold new curriculum for Stanford Medicine. In concert with the School's overall Strategic Plan, "Translating Discoveries," the creation of a medical education curriculum that equips students to face and then lead the challenges of medicine and health care in the 21st Century is essential.

The goals guiding changes in the emerging Stanford Medical Curriculum "Learning to Explore, Advocate and Discover (LEAD Curriculum)" were articulated by the Medical School's Faculty Senate on April 2 2002. These included:

- Restructure the current curriculum to achieve more logical sequencing and integration of related topics, more creative use of learning resources, and more efficient use of time where possible;
- Provide a stronger emphasis on development of clinical skills/clinical reasoning and exploration of physician/patient topics throughout the first two years;
- Create opportunities to introduce or reinforce basic science concepts in the clinical years;
- Create opportunities to pursue scholarly concentrations;
- Create more time in the preclinical schedule for students to engage in:
 - Reflection, independent thought, processing of information
 - Early clinical experiences
 - Course work in other disciplines
 - Independent projects and/or laboratory research

While many challenges remain, considerable progress has been made thanks to the leadership of Drs. Julie Parsonnet, Senior Associate Dean for Medical Education, Oscar Salvatierra, Chair of the Faculty Senate, Ted Sectish, Chair of the Committee on Courses and Curriculum (CCC) and many others. As discussed in the January 20th Dean's Newsletter, progress is underway in the development of the new Scholarly Concentrations that will become available for students entering in the Fall of 2003. At this time, over twenty proposals for Scholarly Concentrations, ranging from Molecular Medicine to Public Policy and Community Service, have been submitted through the recent RFP process. Selection of the first Scholarly Concentration options for the incoming medical school class will be completed by the end of April.

In tandem with the development of Scholarly Concentrations, the CCC has been addressing changes in the sequence, scope and content of the current curriculum. The CCC has addressed a number of important issues, and some general areas of agreement have been reached. These include the fact that beginning in 2003, the Autumn Quarter will be lengthened by beginning classes earlier, thus allowing more time for some of the important curricula changes underway. In addition, it has been recommended that biochemistry should no longer be included in the core curriculum (with the expectation that students will have taken biochemistry before entering medical school) and that, in place, a new course on the ‘molecular foundations of medicine’ will be developed. In order to assure that clinical knowledge and basic science education are synchronized throughout medical school, certain courses now taught in a concentrated fashion in the first two years will be either spread out or introduced as mini-courses during the more clinical years later in the medical school curriculum. These changes will help to better define the core knowledge students require and provide a better road map for life-time learning as well as for the coordinated study of the basic science of human disease. In addition, a goal of the curricula change is to create space during the first years for students to pursue independent study and research through “scholarly concentrations”.

There is no question that the changes that are now being proposed and that are moving toward implementation are significant and challenging. They naturally have their supporters as well as those who would prefer either the status quo or some other pathway. Reaching agreement and consensus is not easy, especially in light of the ambitious timeline underway. Compromise and coordination as well as a tremendous time-commitment have been necessary. Accordingly I want to express my appreciation to the leadership and members of the CCC including: Ted Sectish (Chair) and Pat Cross (Student Affairs), Charles DeBattista (Psychiatry), Maurice Druzin (Ob/Gyn), Jim Ferrell (Molecular Pharmacology), Neil Gesundheit (Office of Medical Education), Sanaz Hariri (Medical Student), Vedant Kulkarni (Medical Student), David Lewis (Neurobiology), Peter Parham (Structural Biology), Julie Parsonnet (Senior Associate Dean for Medical Education), Ellen Porzig (Associate Dean for Graduate Education), Kelly Skeff (Medicine), Ken Vosti (Student Affairs-Emeritus), Elliott Wolfe (Student Affairs), Sherry Wren (Surgery). I also want to thank Betsy Moreno for her many efforts, as well as Steve Keller (SMS I) for creative recommendations and contributions to the dialogue regarding curriculum reform.

While much remains to be done, a significant amount has been accomplished. Our new LEAD Curriculum: The Stanford Plan for Medical Education in the 21st Century, now appears destined to offer exciting innovations that will help students to Learn to Explore, Advocate and Discover and thus improve the lives of adults and children facing the challenge of illness and disease.

New Teaching Physician Guidelines for E&M Documentation

On November 22 2002, the Center for Medicare and Medicaid Services (CMS) revised the rules around the documentation by attending teaching physicians for evaluation and management (E&M) services. Until the implementation of these new rules, attending

teaching physicians needed to separately document the history of the present illness, key portions of the review of systems, past history, family and social history and physical exam in the patient's medical record independent of what was written by the resident. In order to permit teaching physicians to spend more time on patient care and less on documentation, the revised rules, permit the teaching physician to rely on the Resident's note for documentation of this detail. While a note from the teaching physician is required, it does not need to repeat information already contained in the Resident's note. In the new guidelines, the combination of the Teaching Physician and Resident's notes must have the necessary documentation to support the billing code.

Under these new guidelines, effective immediately, the Teaching Physician must include one of the following statements as applicable in the Medical Record:

- I was present and directly participated during the history and examination performed with (Name of Resident) *or* I performed a history and physical exam of the patient (in which case full documentation is needed)
- I have reviewed the resident's note dated ___/___/___ and agree with the documented findings and plan *or* I have reviewed the resident's note dated ___/___/___ and agree with the documented findings and plan, except as documented in my note below.
- I was present and directly participated during the entire procedure or I was present and directly during participated during the key portions as described below, and I was immediately available to return to the procedure.

These changes are very welcome and will certainly help to improve the efficiency of teaching physicians and also eliminate enormous unnecessary redundancy from the medical record.

I want to thank Dr. Al Lane, Chair of the Department of Dermatology, for taking a leadership role in helping to assure the implementation of these new guidelines at Stanford. If you have specific questions please also feel free to contact Ms. Carole Klove, Chief Compliance Officer for SHC and LPCH at 724-1371 or 724-2572.

University Policy on Performance-Based Raises for 2003-2004

As you likely know by now, on February 26th, the Provost sent a letter to all faculty and staff announcing that the University will not be able to provide faculty and staff with performance-based salary increases for next year. On February 27th, Mike Hindery, Senior Associate Dean for Finance and Administration, and I sent a message to the School of Medicine community indicating that we knew that this decision was difficult for all. Also, the School of Medicine, as an integral part of the University, will confront the same challenges and difficult decisions presented by the current economy.

We recognize the outstanding productivity of the School's faculty and staff. We are also cognizant that we are all constantly confronted with the need to do more work. We also recognize the stress and challenges involved with working harder and yet receiving no associated performance-based salary increase.

It is important that we work with the Provost's decision regarding performance-based salary increases for next year at this time. However, we want to make clear that, while accepting the Provost's decision, we will continue to explore and evaluate whatever options we may have or that may emerge. We recognize its impact on you and your families and continue to value you as individuals and as members of the School's community. We will be communicating pertinent information about budget and financial issues as the year goes on and the budget process proceeds.

Biosciences Interviews

From February 27th through March 2nd, some 280 students applying for the Stanford Graduate Program in the Biosciences, visited campus to meet with students and faculty. Each student had six interviews with faculty from the 11 Biosciences Home Programs. There was a palpable energy and excitement as prospective students learned about the extraordinary learning opportunities available at Stanford. Coordinating such a venue is both complex and demanding. I want to thank the chairs, faculty and staff of the Biosciences programs, as well as Ellen Porzig, Associate Dean for Graduate Education and new Assistant Directors of Graduate Education, Suzanne Frasca and Kimberly Griffin for the tremendous amount of work that they did to make the visits so successful.

In a subsequent Newsletter later this Spring, I will give an update of the process and results of the selection of our 2003 Graduate Student Class in the Biosciences.

Learning Technologies Offers Mini-Grants

Learning Technologies in IRT supports the School of Medicine and its faculty in the effective application of education technology to enhance learning. In order to encourage technology integration and evaluation we are pleased to announce the availability of several mini-grants to support course directors and instructors. All applications are welcome. However, priority will be given to applications addressing:

- Integration of educational technologies into existing biosciences graduate courses.
- Use of educational technologies to support preclinical courses and clerkships involved in the curriculum reform effort.
- Evaluation of the impact of educational technologies currently implemented in School of Medicine courses.

Several grants will be awarded, ranging from \$1,000-\$5,000, with \$20,000 total available for all grants. Funds must be used to work in conjunction with Learning Technologies to develop and implement the proposed projects. Development work should be scheduled for the Spring and Summer of 2003 and implemented in the 2003-04 academic year.

Applications are due March 14, 2003 at 5pm. More information and the complete application can be found on the LearningTech website <http://www-med.stanford.edu/olt/> or contact Jenn Stringer, Associate Director, Learning Technologies, jenn@stanford.edu, 723-9688.

HIPAA Update

The Health Insurance Portability and Accountability Act (HIPAA) privacy regulations become effective on April 14, 2003 and will provide significant new privacy protections for the health information of patients and research subjects.

HIPAA Training will be launched in early March. Everyone in the School of Medicine workforce, including volunteers and students, will receive basic training about the privacy regulations. In anticipation of this effort, the Directors of Finance and Business Managers have identified one or more departmental or divisional HIPAA Leads.

All members of the School workforce will be notified with detailed instructions. We anticipate that this will occur during the week of March 10. *If you are not notified, please bring this to the attention of your DFA or Business Manager.*

The first training effort will focus on generalized training. Shortly thereafter, members of our workforce who engage in human research and education will be provided training specific to those topics.

Please review the latest HIPAA project information on the School of Medicine web site <http://www.med.stanford.edu/HIPAA/>

Memorial Service for Dr. Robert Warren Jamplis

On Tuesday February 18th, the Stanford Memorial Chapel was filled with the family, colleagues and friends of to celebrate the life and death of Dr. Robert Jamplis. Dr. Jamplis served as the CEO of the Palo Alto Medical Clinic and played a major role in shaping health care in this community. He was widely admired by all for his drive, charisma, commitment and dedication to improving the lives of the community of Palo Alto.

Appointments and Promotions

- **James K. Chen** has been appointed to Assistant Professor of Molecular Pharmacology, effective 3/1/2003 to 2/28/2006.
- **Ricardo Dolmetsch** has been appointed to Assistant Professor of Molecular Pharmacology, effective 3/1/2003 to 2/28/2006.
- **Donna Peehl** has been reappointed to Associate Professor (Research) of Urology, effective 3/1/2003 to 5/30/2008.

Dean's Newsletter

March 17, 2003

HIPAA Training Update: Basic & Research Training

On April 14, 2003, the Health Insurance Portability and Accountability Act (HIPAA) privacy regulations become effective and will provide increased privacy protections for patients and research subjects. New policies and procedures are being implemented to address the regulations.

Everyone in the School of Medicine workforce, including volunteers and students, will receive training about the privacy regulations. Basic training began the week of March 10 when all members of the School workforce were notified with detailed instructions to access training. *If you were not notified, please contact your DFA, Business Manager, or HIPAA Lead for assistance immediately.*

Training for members of our workforce who engage in human research will begin the week of March 24. A general announcement will be sent to the workforce providing instructions to access the training. If you are a researcher and don't receive instructions, please contact your HIPAA Lead for assistance or go to <http://www.med.stanford.edu/HIPAA/> for more information.

Also, the IRB sent out a month ago a notice requesting protocol directors planning to enroll subjects on or after April 14, 2003, to add HIPAA authorization language to their consent form(s). The template for such language can be found at <http://humansubjects/medical/consent.html#forms>. If you have not received this notice or have not yet responded, please contact the HIPAA-Research staff at 650-725-9834 or hipaa-research@stanford.edu. It is important to underscore that human subjects enrolled in clinical protocols on or after April 14, 2003 must be presented with a HIPAA compliant form. If you have active exempt protocols, please contact the IRB if you intend to continue the research after April 13, 2003. You may need a waiver of individual authorization under HIPAA.

Training for our students and the members of the workforce who interact with them is coming soon. A general announcement will be sent when it becomes available.

Please view the latest HIPAA project information on the School of Medicine web site <http://www.med.stanford.edu/HIPAA/>.

Town Hall Meeting on Cancer Programs

On April 9th we will hold a Town Hall Meeting at 5:30PM in Fairchild Auditorium to review plans regarding the future of cancer programs at Stanford. During this informal meeting, I will be joined by Dr. Irv Weissman, Director of the Stanford Institute for Cancer/Stem Cell Biology and Medicine, and Dr. Karl Blume, Associate Director for Clinical Affairs, to review and update the unfolding plans for cancer care and research at Stanford. We will update the community on our plans to become an NCI-designated Comprehensive Cancer Center. All faculty, staff and students are invited. We are very interested in your comments, questions and recommendations. Please attend.

Additional Changes in the Professoriate

In the November 4, 2002 issue of the Dean's Newsletter (<http://deansnewsletter.stanford.edu/>) I reviewed the changes that have come forth in the Professoriate during the past 18 months. These changes were developed under the guidance of Dr. David Stevenson, Senior Associate Dean for Academic Affairs, in collaboration with faculty committees, the School's Executive Committee and the Office of the Provost. The various changes and clarifications in roles and functions were also presented to the Academic Council and Faculty Senate and discussed in a number of public meetings and in written communications. The major changes focused on the development of function roles for faculty. Included were clarification of the roles as well as appointment and promotion criteria for "Clinician-Investigators/Clinician-Scholars" (i.e., MCL faculty), "Clinician-Educators" (i.e., Staff Physicians) and the "Voluntary Clinical Educators" (i.e., community physicians who play an important role in the education and training of medical students and residents). One of the recent positive outcomes of these changes was the granting of PI-status to our MCL faculty, thus overcoming the need for "PI-waivers" for these faculty members.

Since the announcement of these changes, there has been a considerable amount of concern expressed by our community physician colleagues on what is now perceived to be a lack of recognition of their contributions and a demeaning attitude toward their status. I want to begin by stating that this was surely never our intention. Indeed, the recommended changes were developed through a committee that included representatives from the community and articulated changes that we all thought were fair and appropriate. These included referring to the community physicians as Voluntary Clinical Educators in recognition of the important role that they play in educating residents and students. Although all the appointments that had been made in the VCF prior to these changes were "grandfathered," the revisions will have an impact on future appointments and promotions by taking into account the need and importance of criteria for advancement beyond the length of time in clinical practice (which had been the case in the past). As with at least one other track, the revisions also eliminated the rank of "voluntary clinical assistant professor", meaning that most physicians would enter at the "clinical instructor" rank. It is, however, possible to be appointed directly to the level that is most suitable and appropriate for the individual. Among the most frequent concerns voiced in letters and petitions to the Dean's Office as well as in direct conversations were the change of the title of this group from "voluntary clinical faculty" to "voluntary

clinical educator" and the requirement to include the appellation "voluntary" as part of all working titles in this group. Both of these were seen as quite onerous.

Having heard the concerns from our community we held a series of meetings, discussions and dialogues with representatives from the community. As a result some changes are being recommended. These changes have the concurrence of the Dean's Office, the School's Executive Committee and the University. They include the following two changes, both effective immediately:

1. The appellation "voluntary" will be change to "adjunct". However, it is expected that this appellation will appear whenever the Stanford title is used. Thus, community physician titles will include: Adjunct Clinical Instructor, Adjunct Clinical Assistant Professor (for current holders of this rank; there will be no new appointments to this rank), Adjunct Clinical Associate Professor, and Adjunct Clinical Professor.
2. The term "Voluntary Clinical Educators (VCE)" will be changed to "Adjunct Clinical Faculty (ACF)"

All the other changes that were announced in November will remain. While these changes do not satisfy all the concerns that have been raised, it is our hope that they convey our respect and commitment to our community colleagues, our willingness to listen to the concerns that were expressed, and our attempt to be as responsive as we can be to them at this time.

Launching the Office of Government Affairs

One of the conclusions of our First Strategic Planning Retreat in February 2002 was the importance of establishing an Office of Government Affairs within the School of Medicine (<http://medstrategicplan.stanford.edu/retreat03>). The goal of this office is to create a liaison between the School, Hospitals and University that will forge relations with government leaders at the local, regional and national level in order to better communicate the mission and goals of the School. Further, it is my hope that we will be able to be more proactive in setting public policies that impact academic medical centers like Stanford and that enable us to assume a leadership role as advocates for our programs in education, research and patient care.

I am very pleased to announce that **Mr. Ryan M. Adesnik** will begin today, March 17th, as the director of the new Office of Government Affairs. Mr. Adesnik most recently served as the Vice President of the Carmen Group, Inc in Washington DC where, among other things, he designed and successfully executed innovative strategies to help support academic medical centers and to help represent healthcare coalitions to achieve legislative strategies and objectives. Prior to that Mr. Adesnik served as Senior Legislative Aide to Congressman Benjamin Gilman. Mr. Adesnik holds a BBA degree from Emory University and a JD degree from the University of Miami School of Law.

In this new position Mr. Adesnik will report to the Dean. He can be reached at 650-726-1906 or at radesnik@stanford.edu. Please join me in welcoming Ryan to the School of Medicine and Stanford University.

Formulas, Funds-Flow and Operating Budgets

The School of Medicine is one of two “formula schools” at Stanford University, the other being the Graduate School of Business. This essentially means that medical school is responsible for its own financial support and performance. That said, the School of Medicine and its six sister schools (Humanities & Sciences, Engineering, Earth Sciences, Business, Law and Education) share in common missions in education, research and, for the school of medicine, patient care. Supporting these missions is of course defined by the availability of funding and accordingly by the formulas and operating budgets that delineate the exchange of funds to pay for and support shared services as well as specific functions.

In reality the School of Medicine has three major formulas or funds-flow: one between the University and the School, another between the School and the Hospitals (Stanford Hospital & Clinics and the Lucile Packard Children’s Hospital) and one between the School and its basic and clinical science departments and non-departmental academic units. Because every formula, funds-flow and operating budget has limitations, it is common for special deals or “work-arounds” to occur over time, which often raise concerns and perceptions about equity, fairness and transparency. Accordingly, I felt it was important to revisit these formulas and to develop guidelines and principles to shape them. Quite naturally, in doing so, there is also the risk of creating dislocations of prior funding or support that can inadvertently or actually impact perceived financial interactions and understandings. Despite these risks, I firmly believe that it is best to have a transparent process and to develop formulas, funds-flows and operating budget principles that are clear and simple, and that align goals and objectives as closely as possible. Accordingly, during the past year we have been actively involved in reassessing and redoing the formulas, funds-flow and operating budget between the university, school, hospital and departments. It is important to note that this is a work in progress and that whatever formulas are developed will need refinement and redefinition over time.

Formula between the School of Medicine and the University

The Working Group for reviewing the University-School of Medicine Formula was led by Randy Livingston, CFO for the University, and Michael Hindery, Senior Associate Dean for Finance and Administration, and included, for the University, Paul Goldstein and Tim Warner and, for the School of Medicine, Carole Buffum and Perry Everett. This group presented their results and recommendations to the Provost and Dean. The guiding principles included the following:

- The School of Medicine should pay its fair share of the costs of operating the University.

- The University should allocate and credit to the School of Medicine the revenue it generates.
- It might be appropriate for the School to make some contribution to the University beyond its fair share of the costs.
- The methodology for the allocation of revenue and costs should be simple and easy to explain.
- The formula should capture and clarify all services and activities except for liability insurance and direct legal defense and settlement costs, eliminating the need to negotiate separate programs (i.e., compliance),
- The methodology should be feasible to use for at least several years without extensive recalculation.
- The methodology should be initially reviewed and revised after three years and then as necessary – but at least every five years.

The working group evaluated both a revenue and an expense-based methodology and chose the revenue-based approach. It was felt that this method would require less recalculation from year to year and would be easy to explain as "income tax." Further it was felt that linking the amount to be paid to the University to revenue creates an incentive to keep central costs down. The charge assessed to the School is intended to represent and pay for the costs of services provided by the central campus administration.

The amount charged to the School will be determined by the percentage of revenue generated by the School. The tax rates will be related to the School's portion of the total revenue, including gifts, and will apply to all campus services and expenses, including maintenance/police, fire, etc, central administration, office of development, sponsored projects administration, student services (both graduate and undergraduate).

This new revenue based formula will become operative in FY04. While it will lead to some challenges, it will go a long way to making the process transparent between the University and the School and, importantly, in dissipating the perception that either the University or the School is receiving or paying too much or too little to each other. While that sounds obvious, it is not uncommon for members of the non-medical University community to worry that the University is subsidizing the School of Medicine or conversely, for the Medical School faculty to believe that it is supporting the University. Hopefully, the new formula will provide a transparent means to assure that both the University and the School are being equitably and fairly treated in their financial interactions.

Revised Operating Budget Within the School of Medicine

Also during the past year, a committee chaired by Michael Hindery, Senior Associate Dean for Finance and Administration, has been addressing the operating budget within the School of Medicine. Members of this committee include Eleanor Antonakos, John Boothroyd, Carole Buffum, Brian David, Garry Fathman, Michael Levitt, James Nelson, Julie Parsonnet, Robert Robbins and Judy Swain. This group met intensively over the past many months to define the principles, goals, and methodology for a new School of Medicine Operating Budget.

Among the key objectives of the Committee was to define a formula that provides direct funding for teaching (including both team and interdisciplinary teaching), that recognizes both departmental and non-departmental academic units, and that is simple and easy to calculate. The Committee further wanted to make sure that the revised operating budget formula would accommodate to changing organizational and interdisciplinary models, reinforce local control and decision-making, and permit an understanding of both revenue and costs. Clearly the Committee also sought for a formula that would be fair, transparent and scalable and that permitted data to be shared across the School.

The current formula, which has been in place for decades, is calculated based on a percentage of tuition revenue, indirect cost recovery, and base salary of university tenure line faculty. However, the dollars were pooled and not specifically designated to specific missions or goals. In the new operating budget formula, a specific allocation will be made for education, focusing on course direction and favoring, in particular, small group teaching, including laboratory-based teaching of graduate students. In addition, funds for education innovation and/or transition will be included in the new budget.

In addition to specifically focusing on funding education, the new operating budget formula is calculated based on all faculty members equally – including UTL, MCL, and NTL faculty. Further, the new operating budget formula will recognize space costs and indirect cost recovery as well as modified total direct costs – with further work underway to recognize the varying importance of different types of sponsored research funding.

Although there is still work to be done to finalize the specific allocations to each of the categories, the new formula recognizes the importance of education, acknowledges all faculty equally in the calculation, addresses research space and utilization, and provides a more principled approach to the operating budget allocation with the School to departments and non-departmental academic units.

At the same time we recognize that any new formula runs the risk of unintended negative impact on some departments – which must, of course, be dealt with in a transparent and fair manner. Our goal has been to come up with a methodology that permits us to better align funding to our missions and to underscore the interconnectedness of our research and clinical faculty. Indeed, we can only achieve the excellence we strive for by supporting and valuing the contributions of both our basic and clinical science faculty.

It is our expectation that the new Operating Budget will be implemented for the FY04 budget cycle.

Funds Flow Between the Hospitals and the School of Medicine

Work is also ongoing to finalize the funds flow issues between the hospitals and the School. One important aspect of this flow of funds is the professional services payments that relate directly to the clinical practices associated with both SHC and LPCH. It should be noted that the School has placed a direct tax known as the “Dean’s Tax.” of 6.1% on the clinical practices. This support is essential to help cover general school

expenses including recruitments, retentions, new programs, departmental deficits, etc. In addition to the professional service revenue, clinical faculty also receive funding support for non-reimbursable activities they carry out, including their roles in medical direction. Included also is support for services that the hospital believes it needs despite the fact that they may not be financially viable (e.g., “essential services”) and for new program development. There are other important aspects of hospital-school funds flow hope will be reconciled in the next weeks. Here too the goal is to make this important exchange of funds equitable and transparent – both between the hospitals and the School as well as among the School’s departments and the Dean’s Office.

Special Events

- ***Honoring Dr. Ralph Spiegl.*** On March 4th more than 120 family, friends and former patients gathered in the Faculty Club to honor the nearly four decades of outstanding contributions that Dr. Ralph Spiegl has made to the School of Medicine and Stanford University. Joined by his wife Marilyn, seven children and 12 grandchildren, former colleagues, patients and friends spoke by the remarkable contributions of Ralph Spiegl to their lives, Stanford and the community. I would add that in my nearly two years at Stanford, I have had the opportunity to witness Dr. Spiegel’s dedication and commitment to our students and School in a number of significant ways. It is notable that he was also previously presented with the “Golden Spike” Award, the highest honor for volunteer service at the University. I would like to again extend my thanks and appreciation to Ralph and Marilyn for their kindness and generosity to Stanford and the School of Medicine.
- ***Dwight and Vera Dunlevie Professorship.*** On Monday March 10th, the friends and colleagues of the Dunlevie family joined with the family, friends and family of Dr. Marlene Rabinovitch to celebrate her appointment as the first incumbent of the Dwight and Vera Dunlevie Professorship in Pediatric Cardiology. Dr. Rabinovitch recently joined Stanford from the University of Toronto as Professor of Pediatrics and Research Director of the newly created Vera Moulton Wall Center for Pulmonary Vascular Disease at the Lucile Packard Children’s Hospital and Stanford Hospital and Clinics. Our thanks and gratitude goes to the remarkable generosity of Bruce and Elizabeth Dunlevie and the Dunlevie family for establishing this new professorship. Please join me in congratulating Dr. Rabinovitch as the first incumbent of this newly created endowed professorship.
- ***Helen and Peter Bing Luncheon Series:*** On Wednesday March 12th, we had our final “Bing Luncheon” for the 2002-2003 Academic Year. These special luncheon events represent a tradition extending back well more than a decade thanks to the support of Helen and Peter Bing. They include presentations by leading faculty to a group of Friends of Stanford who reside in southern California. Four events are held each academic year. The March 12th luncheon lecture was given by Dr. Tom Quertermous on the interplay between genes and the environment in relation to heart failure and disease. Thanks again to Helen and Peter Bing for making these events possible.

- ***On the Road in Los Angeles Alumni Event.*** On Saturday March 8th we held our annual “On the Road in Los Angeles” Alumni Event. Thanks to the support of the Stanford Medical Alumni Association under the leadership of Dr. Ross Bright, we visited with alumni and hosted an educational program that included presentations by Dr. D. Craig Miller, Thelma and Henry Doelger Professor of Cardiovascular Surgery, on “Thoracic Aortic Stent Graphs: The Future or a Failed Clinical Experiment?” and by Dr. C. Garrison Fathman, Chief of the Division of Immunology and Rheumatology, Director of the Center for Clinical Immunology, and Professor of Medicine, on “New Directors in Gene Therapy to Treat Autoimmune Diseases”. In addition, I had the privilege of being able to give an update to Alumni on the State of the School.

Congratulations

I am very pleased to announce that Mina Matin, third year Stanford Medical Student, received the “Best Poster” Award from the International Health Medical Education Consortium in New York for her work on the attitudes of Muslim women in the Bay area toward health care. Congratulations to Mina.

I also pleased to announce that Dr. James Hallenbeck, Assistant Professor of Medicine at the Palo Alto Veterans Affairs Health Care System, has been awarded the 2002 David M. Worthen Award for Academic Excellence for his work in education in palliative care. This award is the highest award given by the Department of Veterans Affairs to recognize outstanding achievements of national significance in health professions education. Congratulations to Dr. Hallenbeck.

Appointments and Promotions

* Daniel Arber has been appointed Professor of Pathology, effective 3/1/2003 to 2/28/2008.

* Ting-Ting Huang has been appointed Assistant Professor (Research) of Neurology and Neurological Sciences, effective 3/1/2003 to 2/28/2006.

* John Huguenard has been appointed Associate Professor of Neurology and Neurological Sciences, effective 4/1/2003.

* Peter Jackson has been promoted to Associate Professor of Pathology and of Microbiology and Immunology, effective 4/1/2003.

* Edward Manche has been promoted to Associate Professor of Ophthalmology, effective 3/1/2003 to 2/28/2008.

* V. Mohan Reddy has been appointed Associate Professor of Cardiothoracic Surgery (Pediatric Cardiac Surgery) and of Pediatrics, effective 3/1/2003 to 2/28/2009.

* Samuel K.S. So has been promoted to Professor of Surgery (General Surgery), effective 3/1/2003.

* Roy Soetikno has been promoted to Associate Professor of Medicine (Gastroenterology and Hepatology), effective 3/1/2003 to 2/28/2008.

* Daniel Sze has been promoted to Associate Professor of Radiology, effective 3/1/2003 to 2/28/2008.

Dean's Newsletter

March 31, 2003

Two Years Already

Although I am still often introduced as the “new dean of the School of Medicine” (which is either a good or bad sign depending on one’s perspective), it is remarkable to me that this week marks the end of my second year at Stanford. The days have marched by without pause and have been punctuated by the many changes in our community and, even more importantly, the world around us.

It has been my privilege to meet and interact with countless students, faculty and staff throughout the School, Hospitals, University and Community since coming to Stanford. I am always impressed by the intelligence, commitment and accomplishments that occur within our School and University. Indeed, during my time here, our faculty, students and staff have achieved a number of startling discoveries, innovations, and accomplishments. In addition to individual successes, one of the most important activities at Stanford is the focus in interdisciplinary and collaborative research, education and, within the School of Medicine, patient care. Certainly notable are BioX and the Clark Center, the new joint Department of Bioengineering, the emerging Stanford Institutes of Medicine, our evolving LEAD (Learning to Explore, Advocate and Discover) Curriculum, and our commitment to engaging our faculty in our long-range strategic plan “Translating Discoveries” (<http://medstrategicplan.stanford.edu/>). All of these efforts exemplify our shared commitment to our mission “*to be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovations in patient care, education and research*”.

I want to express my continued appreciation and thanks to all the individuals who have worked so hard during my time at Stanford to help us make progress in helping our school become a role model among academic medical centers. I have appreciated your support. In addition to the important leadership provided by our basic and clinical science department chairs and senior associate deans, I want to also thank the numerous students, faculty and staff within the School and Medical Center for the many ideas, suggestions and hard work they have contributed. Even when we have had disagreements

about issues or directions to pursue, we - and most importantly the School - have benefited from critical debates and refinements of ideas and plans. I also want to thank the support and cooperation of our Hospital CEOs and leaders at Stanford Hospital & Clinics, the Lucile Packard Children's Hospital, the Palo Alto VA Hospital and Santa Clara Valley Medical Center. Perhaps most importantly, I am appreciative of the support the School and I have received from our President, Provost, Deans of other Stanford Schools and our Board of Trustees. Given the many changes around us - both those we have introduced and those emanating from the crisis in health care - this support has been essential and most appreciated.

Of course everyone's attention is now riveted to the changing world landscape that has also been occurring during the same past two years. As a community dedicated to scholarship, discovery, promotion of health and well being, it is most distressing to witness the tragedies that are occurring world-wide and especially in Iraq. I recognize that in a community like ours there are many opinions and positions and that it is important to be respectful to the rights of speech and expression. I do not wish to impose my views but it is hard not to comment on how very tragic I find the decisions that have been made by world leaders, including our own. There is no question that tyranny and terrorism are reprehensible and should be condemned by our global community. But to stray from working with the world community and to operate virtually unilaterally represents, in my opinion, a de-evolution of social progress, and risks further severing alliances that have been formed and forged during the past decades. One can only hope that our leaders will now seek to work more closely with the global community and its leaders to assure the preservation of human freedom and dignity. As physicians and scientists we must speak for the health, freedom and dignity of our community - including our global community. I fear that we are not doing that at this point and hope that future policies will be more embracing - for the health of individuals and for the world.

A Very Successful Match Day

Thursday, March 20th, was Match Day for our graduating medical students. At 9am PST (and noon EST), students were issued the news of where they matched for internship. Although a few disciplines match a bit earlier, all share the excitement of the day.

As I hope you have already heard, this year's Match was enormously successful. Indeed, 80% of students matched at their first choice, and 96% matched at one of their top 3 choices. Among the most frequent sites our students will be serving as residents beginning this June/July are Stanford, UCSF, Harvard, Yale, Columbia, Cornell, Penn and others. A complete listing follows:

2003 Residency Match Results: Stanford University School of Medicine

Yeh, Cory	Harvard Hospital	Otolaryngology
Yu, Grace Chen	San Jose Med Ctr-CA	Family Practice

We should all congratulate our students for their clear success. They should feel proud of their accomplishments. I also want to thank Senior Associate Dean Julie Parsonnet, our Faculty Advisors (Drs. Terry Blaschke, Denise Johnson, Susan Knox, Kuldev Singh), Dr. Elliott Wolfe and all the wonderful members of the Office Student Affairs for their dedicated commitment and work on behalf of our students. Also thanks for support from the Stanford Medical Alumni Association (SMAA). We had the opportunity to celebrate

the accomplishments of our students and their guests at the Eighth Annual Match Day Celebration on the evening of March 20th in the Faculty Club.

You may recall that some months ago I shared some of the anxieties and debates that were unfolding as we began making changes in the Dean's letter. It seems clear that those changes have been beneficial and I am confident that the clarity on performance that we will bring in future years will be even more helpful to our students. That said, most important of all are the accomplishments of the students themselves. Indeed they are easy to write about when they are well accomplished - as was clearly the case for this year's graduates.

I should also add that in addition to our own medical students doing well, each of the Residency Programs at Stanford Hospital and Clinics and the Lucile Packard Children's Hospital also did extremely well in drawing Stanford and other outstanding students to their residency programs, making this a stellar year for the School and for the Medical Center.

Of course it should also be pointed out that although Match Day has been highly successful since its inception, it is currently under challenge by Jung vs. NRMP. Hopefully this matter will be resolved in a manner that permits this important tradition to continue.

Curriculum Reform on Tight Schedule

As I have discussed in prior Newsletters, progress is underway to make substantive and exciting changes in our medical education curriculum - LEAD (Learning to Explore, Advocate and Discover). Thanks to the efforts of Drs. Julie Parsonnet, Neil Gesundheit, Ted Sectish and the Course Directors, the Faculty Senate, and the Dean's Office, who have been working closely to make the required changes that will enable the new curriculum to begin this Fall. The most immediate next step includes an April 9th meeting with Course Directors along with a Town Hall Meeting with students and faculty to review the progress that has been made to date - and the work that remains. Also in April, selections of the Scholarly Concentrations that will be launched this Fall will be made. Understandably this is a most demanding and challenging time for all who are involved in this process - and I want to thank everyone for the tremendous work they are doing on behalf of our students.

Important HIPAA Announcements:

- Training for School of Medicine Researchers
HIPAA research training specific to the Stanford research environment is now available. If you participate in research activities that involve humans, you are required to successfully complete this training. The training will require about one hour and may be accessed at <http://www.med.stanford.edu/HIPAA/training/>

Basic HIPAA training began the week of March 10 when all members of the School workforce were notified of this requirement and given access instructions for the training. *If you were not notified, please contact your DFA, Business Manager, or HIPAA Lead for assistance immediately.* It is recommended that you complete the HCCS basic training before beginning the Stanford-specific research module.

If you have questions, please contact us at hipaa@med.stanford.edu, or telephone the HIPAA Compliance Project at 724-7481.

For the latest information on the School of Medicine HIPAA project, please visit our web site <http://www.med.stanford.edu/HIPAA/>

- Active Research Protocols and Databases, Enrollment of Human Subjects
Active exempt protocols or research databases created prior to April 14, 2003 must be reviewed by the IRB for HIPAA compliance. Please contact the IRB if you intend to continue your research after April 13, 2003. You may need a waiver of individual authorization under HIPAA.

Subjects enrolled on or after April 14, 2003 must be presented with a combined informed consent/HIPAA authorization form. Protocol directors planning to enroll subjects on or after April 14, 2003, need to add HIPAA Authorization language to their consent form(s) and submit this revision to the IRB. Template for such language can be found at <http://humansubjects/medical/consent.html#forms>

If you have not received the notice the IRB sent out a month ago, or have questions about an existing research protocol or database, please contact the HIPAA-Research staff at 650 725-9834 or hipaa-research@stanford.edu

Continuing Review of Medical Human Subjects' Activities

The following requests your attention to a very important matter that requires strict adherence. Human subjects' research activities have grown significantly over the past years and so has the complexity of the regulations governing the protection of human subjects. Our Human Subjects Panels are responsible for initial protocol review, as well as continuing review of ongoing research to ensure that the rights and welfare of human subjects are protected. Continuing reviews must take place, at a minimum, on an annual basis.

To facilitate the continuing review process, the Human Subjects Panels send out reminder renewal applications approximately six weeks before the protocol's expiration date. Given our current volume of over 5000 human subjects' activities per year, this is a substantial undertaking.

It is imperative that you respond to the Human Subjects Panel by the date specified on the Renewal Notice. The continuation of research after expiration of approval is a violation

of federal regulations; human subjects' research activities must stop; no new subjects may be enrolled in the study.

The Human Subjects Panel will **send only one notice** to remind you of your renewal obligations. It is your responsibility to renew your study on time and to comply with Stanford policy and federal regulations to maintain your privilege to use human subjects.

Please feel free to contact Kathy McClelland (**Kathy.McClelland@stanford.edu**) in the Research Compliance Office if you have any questions.

Changes in the Dean's Office

During the past two years, Dr. James Nelson has made enormous and enduring contributions to the School through his work on behalf of Graduate Students and Postdoctoral Scholars. However, because of the increasing demands of his research and teaching responsibilities, he has elected to step down from his position as Senior Associate Dean for Graduate Education and Postdoctoral Scholar Affairs. While I am sorry that we will not benefit from his future work as a Senior Associate Dean, I am pleased that I have had the opportunity to work with Dr. Nelson and that he will remain available for special guidance and consultation. He has done a terrific job and I will miss working directly with him - both professionally and personally. I want to thank him for all that he has done for our students, fellows and the School, and I hope you will also find a way to thank him as well.

I have asked Drs. John Boothroyd and Harry Greenberg to expand the scope of their responsibilities to include graduate education and postdoctoral affairs. You may recall that two years ago we had combined the roles of the Senior Associate Dean of Research to include Graduate Education and Postdoctoral Affairs. That proved to be too large a portfolio for a single individual working part-time in the Dean's Office, so we split the functions of Research and Education. Given that Drs. Boothroyd and Greenberg are working very closely together to cover our basic and clinical research agenda, it seems appropriate to expand and adjust their individual and collective responsibilities to also embrace graduate education and postdoctoral scholar affairs. Specifically, Dr. Boothroyd will assume oversight over graduate education and postdoctoral fellows. Dr. Greenberg will assume responsibility for clinical fellow programs. They will continue to work closely together. To accommodate these new additional responsibilities, Dr. Greenberg will pick up oversight over the animal programs from Dr. Boothroyd.

Our plan is to assess this new model through the end of the year. However, I am quite confident that both Drs. Boothroyd and Greenberg will do an outstanding job, and I am most appreciative of their willingness to serve the School, our students and trainees in this important matter.

New Professorships at the School of Medicine

I am very pleased to report that the Provost has announced the following new endowed professorship appointments for faculty in the School of Medicine. They will be reported to the Board of Trustees on April 7th and I am most pleased to be able to share this news with you now. They include:

- **Stanley Falkow** has been appointed the Robert W. And Vivian Cahill Professor.
- **Roger D. Kornberg** has been appointed the first holder of the Mrs. George A Winzer Professorship.
- **Daria Mochly-Rosen** has been appointed the first holder of the George D. Smith Professorship in Translational Medicine.
- **Kelly M. Skeff** has been appointed the first holder of the George DeForest Barnett Professorship in Medicine II.
- **Lucy S. Tompkins** will be appointed the Lucy Becker Professor in Medicine on June 1st. (Eugene Bauer will become emeritus at that time).
- **Judith L. Swain** has been appointed the first holder of the George E. Becker Professorship in Medicine.

Please join me in congratulating each of these individuals on being appointed an endowed Professor at Stanford.

Town Hall Meeting to Discuss Cancer Research and Care at Stanford

On April 9th, we will hold a Town Hall Meeting at 5:30PM in Fairchild Auditorium to review plans regarding the future of cancer programs at Stanford. During this informal meeting, I will be joined by Dr. Irv Weissman, Director of the Stanford Institute for Cancer/Stem Cell Biology and Medicine, and Dr. Karl Blume, Associate Director for Clinical Affairs at the Institute, to review and update the unfolding plans for cancer care and research at Stanford. We will update the community on our plans to become an NCI-designated Comprehensive Cancer Center. All faculty, staff and students are invited. We are very interested in your comments, questions and recommendations. Please attend.

Council of Clinical Chairs Update

At the March 28th Council of Clinical Chairs meeting Mr. Michael Calhoun reviewed the work being done on the Stanford Hospital & Clinics Budget Priorities for FY'04. Central to these will be initiatives to provide excellent quality of care that achieves national distinction in all areas of medicine and that has national prominence in cancer, cardiovascular health, neuroscience and transplantation. Of interest, these areas are closely aligned to the School's planned Stanford Institutes of Medicine (i.e., Cancer/Stem Cell Biology, Cardiovascular Medicine, Neurosciences, Immunology & Infectious Diseases). In addition, SHC will focus on providing excellent service in both in-patient and outpatient areas that achieve a high satisfaction by patients and employees. SHC will

also focus on achieving excellent financial performance. Mr. Calhoun outlined primary tactical goals and implementation actions in each area. He requested that the COCC and faculty provide feedback about these goals, tactics and implementation steps in the next week.

Upcoming Symposia:

- ***Frontiers in Neuroscience:*** Beginning April 3rd, the Department of Neurobiology will present the first in a weekly series of Frontiers in Neuroscience that will be held in the Munzer Auditorium beginning at 4:15 p.m.. This is an outstanding series.
- ***Show Me the Money! Collaborations, Contracts and Consulting:*** Faculty and senior post docs are invited to a seminar ‘**Show Me the Money! Collaborations, Contracts, and Consulting**’, Wednesday, April 2, 2003, 5:00 p.m.-7:00 p.m. in Munzer Auditorium. This seminar is aimed at those interested in learning how to navigate the research enterprise, enhance their interactions with industry, and eliminate delays in their research activities.

Presenters include Dr. Ann Arvin, Associate Dean of Research; Elizabeth Caplun-Cochrane, Associate Director, Research Compliance; Barbara Flynn, Manager, Conflict of Interest Review Program; Katharine Ku, Director, Office of Technology Licensing; Sally O’Neil, Manager, Industrial Contracts Office; Kathryn Pyke, Senior Contract Officer, Office of Sponsored Research; Kathleen Thompson, Co-Director, Research Management Group; Ted Tussing, Director, Corporate Relations.

To register please contact Shawn Harlan at 725-9037 or email shawn.Harlan@stanford.edu

- ***13th Annual Beckman Symposium and launch of Stanford’s newly established Institute for Cancer/Stem Cell Biology and Medicine.*** Dr. Lucy Shapiro, Director, Beckman Center for Molecular and Genetic Medicine, and Dr. Irving Weissman, Karel H. and Avice N. Beekhuis Professor in Cancer Biology and Director of the Institute for Cancer/Stem Cell Biology and Medicine, invite you to attend this inaugural event for Stanford’s new Institute for Cancer/Stem Cell Biology and Regenerative Medicine.

Speakers include Michael Clarke (Stanford); Fred Gage (Salk Institute); Rudolf Jaenisch (MIT); Seung Kim (Stanford); Ma Surani (UK Institute of Cancer and Developmental Biology); James Thomson (University of Wisconsin); Irving Weissman (Stanford); Hynek Wichterle (Columbia University); Owen Witte (UCLA).

This two-day event will be held in the Fairchild Auditorium, Stanford University School of Medicine:

Monday, April 14, 2003 12:00 p.m. – 6:00 p.m.
Tuesday, April 15, 2003 7:00 a.m. – 8:00 p.m.

Event Coordinator: Belinda Byrne (650-724-0034; bbyrne@stanford.edu)

- **Second Staff Seminar** is scheduled for April 23, 2003. We are pleased to announce that **Dr. Irving Weissman, Karel H. and Avice N. Beekhuis Professor in Cancer Biology and Director of the Institute for Cancer/Stem Cell Biology and Medicine.** The Staff Seminar Series is intended to give administrative staff an opportunity to hear faculty talk about their science and research, giving staff a better understanding and a closer connection with the research mission at the School of Medicine. This seminar will be held from 3:30-4:30, refreshments following until 5:00 on April 23rd.

To register, click on <http://reggie.stanford.edu/signup.asp?720>

Congratulations

- **Dr. Paul Berg** was awarded the Sustained Leadership Award at the National Level by Research America at a gala event held at the National Academy of Sciences on March 18th. Dr. Irv Weissman and I had the pleasure of being at the event with Dr. Berg and his wife Millie. This is another in a very long list of accolades and honors for Dr. Berg, but it does speak specifically to the very significant contributions he has made as an advocate for science and medicine. His leadership in the recent stem cell debate has been particularly noteworthy.
- **Katy (Ekaterina) Gladysheva and Amy Chow**, both first year medical students have been selected to be Fellows of the Paul and Daisy Soros Fellowship for New Americans. Please join me in congratulating Katy and Amy.

Appointments and Promotions

- **Ajay Chawla** has been appointed to Assistant Professor of Medicine (Endocrinology, Gerontology and Metabolism), effective 4/1/2003 to 3/31/2006.
- **John Huguenard** has been appointed to Associate Professor of Neurology and Neurological Sciences, effective 4/1/2003.
- **Peter Jackson** has been promoted to Associate Professor of Pathology and of Microbiology and Immunology, effective 4/1/2003.
- **W. James Nelson**, Professor of Molecular and Cellular Physiology, has also been appointed Professor, by courtesy, of Biological Sciences, effective 1/1/2003 to 12/31/2007.

Dean's Newsletter

April 14, 2003

We're In a HIPAA World Now

Although you may be focused on April 15th as the deadline for filing your income tax, April 14th was the effective date for HIPAA compliance. Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, and his staff have made numerous teaching and presentation materials available to you through a variety of media. If you have not already done so, it is imperative that you complete your training as soon as possible. Please refer to the Web Site <http://www-med.stanford.edu/HIPAA/training/> for the necessary information and guidance.

SARS (Severe Acute Respiratory Syndrome)

Because there have been so many inquiries and expressions of concern regarding SARS, David Silberman, Director of Health and Safety, has prepared the some comments noted below. Specifically, the University is carefully monitoring the situation regarding recent reports of SARS both abroad and locally. University officials have been in contact with public health agencies and have determined that there is no health emergency on campus.

Returning to the Workplace

At present, no directives have been received from the Centers for Disease Control or local Health Departments (Santa Clara, Palo Alto or the California Department of Health Services) advising us to avoid contact with people returning from China and other areas where SARS has been reported, **unless they**:

- have been treated, cared for or been in contact with an individual diagnosed for SARS;
- have stayed in a hotel (especially the Hong Kong Metropole) where the disease has been reported;
- show any signs or symptoms associated with SARS (e.g., temperature or fever), or
- experience any symptoms associated with SARS, upon returning to work.

Individuals who have been in areas where SARS has been reported and feel they are experiencing symptoms of the disease should see their personal physicians immediately. David Silberman is in contact with the Hospital's Infection Control Department who will advise him if there are any changes to the above procedure.

Traveling Related to Work

While employees may choose to proceed with work-related travel plans (i.e. conferences, symposia, etc.) to CDC-identified locations where there has been an outbreak of SARS, I would strongly suggest that they should not do so unless absolutely essential.

For more information about this topic, we refer you to the following web sites:

<http://www.stanford.edu/dept/ucomm/sars/>

<http://www.cdc.gov/ncidod/sars/>

If you have additional questions after reviewing the web site information, please contact David Silberman, Director of Health and Safety at davidhs@stanford.edu.

Ratings: Better But Still Not Right

On Monday April 7th, *US News & World Reports* came out with its annual ranking of graduate schools, including schools of medicine. In this latest report, Stanford was ranked #8 among research-intensive medical schools. While it is gratifying to be listed as a top ten school, the methodology used in this ranking is flawed in my opinion and actually adversely impacts our School.

Here's the problem. *US News & World Reports* weighs most heavily among its criteria the total amount of NIH funding. Stanford has the highest amount of peer-reviewed NIH funding in the nation per principal investigator, but because we are also among the smallest of the research-intensive schools, our total amount of NIH funding is necessarily limited compared to larger Schools of Medicine. Thus, in actuality, *US News & World Reports* values size more than quality.

Last year I wrote to the Editors of *US News & World Reports* about this problem and visited with them in Washington, DC. My message was that they should employ a methodology more akin to that used in schools of engineering whereby they weigh equally the total amount of NIH funding and the NIH funding per PI. That would be much fairer. If this is done for medical schools, it would mean that Stanford would be within the top 5 schools – more accurately reflecting our true ranking.

I intend to continue to try to “educate” the editors of *US News & World Reports* with the hopes that they might revise the criteria for future years. In the interim, it is only fair to say that our ranking this year is better, but still not right!

Making Our Whole Greater Than the Sum of Its Parts

One of the most striking comments I heard on arriving at Stanford was that our collective whole as a school was less than the sum of its parts. Among the most important achievements of the past two years has been the unification of basic and clinical science leaders within the School of Medicine around a commonly shared and valued mission. Equally important has been the increased understanding and appreciation of the significant and unique challenges faced by basic and clinical investigators and clinician scholars and educators – both separately and together. Our ability to work together in education, research and patient care – and in particular in translating discoveries from the bench to the bedside – is and will be one of our most distinguishing features. Indeed, I believe we have come to recognize that translational research and medicine will help define the future of Stanford Medicine for the 21st Century. Needless to say, our success

depends on our willingness and ability to work collaboratively, share ideas and resources and most importantly, to have mutual respect for our individual and collective roles.

Unfortunately, in recent weeks, our unified resolve has been challenged and even shaken by concerns, perceptions and misimpressions regarding the consequences of changes in the School's Operating Budget (see below for additional details). Indeed these have been characterized as indicators of whether one community (e.g., basic or clinical science) is more important or valued than the other; whether one department deserves more or less support than another on a relative or absolute scale; and whether financial support *per se* translates into evidence of greater respect or value within the School and University.

I want to underscore that our ultimate success depends on being a community that values equally the contributions made by basic and clinical scientists and physicians. Our missions in education, research and patient care are interrelated as are the funds that help to support them. Sadly, a number of our missions do not bring sufficient revenue to stand alone without additional institutional support and thus this requires our alignment, willingness to share, and most importantly, respect for and value of each other's contributions. That recognition has resonated loudly at our Leadership Retreats in 2002 and 2003. Only if we work collaboratively and respectfully can our "whole exceed the sum of our parts". Despite the tensions and reactions that have arisen during the discussions regarding the changes in our School's Operating Budget, I am confident that we can all rise above the immediate concerns and put Stanford Medicine first. Our students, colleagues and patients – and the future success of our Medical School and Medical Center – make that essential.

So, What Has Been Going On Regarding the Operating Budget?

In the March 17th Dean's Newsletter (<http://deansnewsletter.stanford.edu/>), I described some of the important changes that have been made in various funds flows between the University and School of Medicine (aka "The Formula"), between the School and Stanford Hospital and Clinics (aka "Funds Flow") and between the Dean's Office and Departments (aka "Operating Budget"). Each of these has been challenging and contentious. As noted above, the changes in the Operating Budget have created some specific rifts between our basic and clinical science departments and leaders. This is not so much around the principles of the Operating Budget but rather about the financial implications and impact of its initial application.

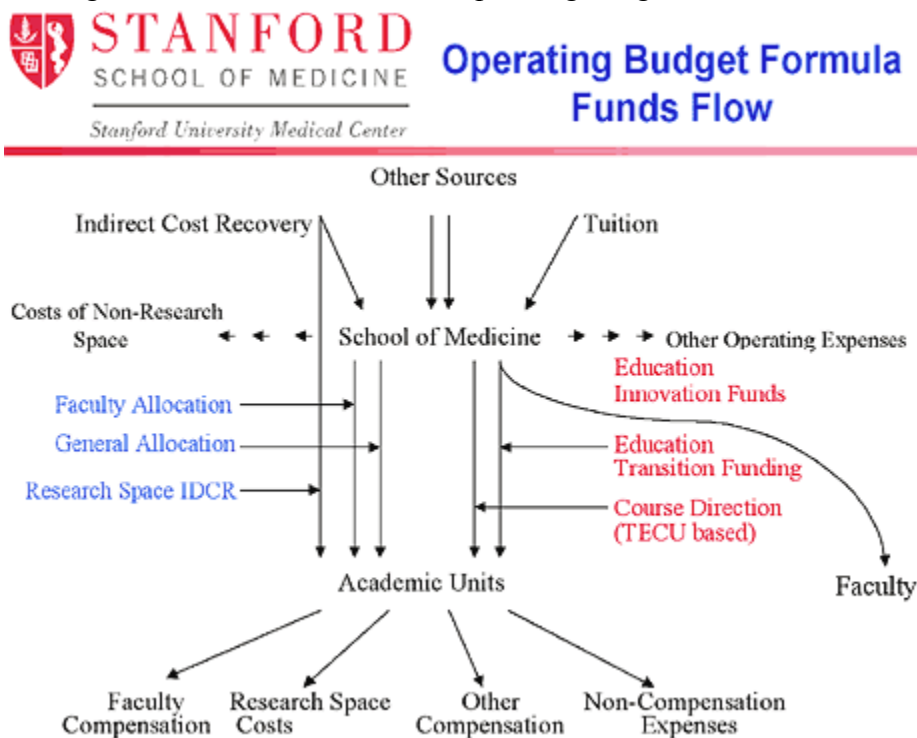

So, what is going on regarding the Operating Budget? First I want to point out that the reasons for making changes in the current Operating Budget formula are because it has no guiding principles and because the former Operating Budget formula did not help us to achieve most effectively our missions, especially in education. Accordingly, I charged a committee of basic and clinical science faculty and staff to develop principles to determine the School's allocation of funds to support education, programs and personnel. It is important to underscore that the Operating Budget is just one of the funding sources for departments, others being sponsored research grants, gift funds, patent funds, endowment support, clinical income and strategic and/or discretionary allocations from

the Dean's Office. I asked Mr. Michael Hindery, Senior Associate Dean for Administration and Finance, to chair this Operating Budget Committee and to prepare a principles-guided methodology that could be implicated for the FY04 budget. The Committee completed its work in early March of this year. To give you some background, I asked Mike Hindery to describe some of the changes that have occurred in the Operating Budget Formula. His comments follow.

The School of Medicine allocates funds to academic units to support its education, research, and patient care missions and activities. This support is done through discrete programmatic investments that are generally time-limited and non-recurring and through an allocation of operating budget general funds. The dollars provided by the Dean's Office are used to pay faculty and staff compensation expenses and for expendable materials and supplies. The School has used a formula (the Operating Budget "Blocks") developed and implemented in the early 1980's to allocate the general funds. This block formula has provided the departments with unrestricted dollars that could be used at the discretion of the department chair to fund the department's activities. In order to align better the allocation of financial support with the School's activities and priorities and to provide direct funding for educational activities, the School, through a faculty and staff committee, has developed a new formula for allocating the operating budget general funds. The new formula will be used to allocate funds for FY 2004.

The School of Medicine's new formula for distributing operating budget funds to academic units has four components: education; faculty census; general allocation; and research space. The four components are calculated differently and have two general intents. The first intent is to provide direct funding for particular activities with the expectation that the allocated dollars are used for the specific purposes. The education and research space components are in this category. This intent and directed use is markedly different than the block formula currently used. The second intent is to provide unrestricted, unallocated dollars to the academic units to support the full array of expenses, including faculty and staff compensation and non-compensation expenses, incurred to fulfill the School's education, research, and patient care missions and activities. The faculty census and general allocation are in this category. The use of these funds is similar to all the funds provided by the block formula.

The algorithm that defines the new operating budget is shown below.

The total amount of the education allocation is equal to 90 percent of the prior year's MD and PhD tuition revenue. The education component is allocated through three mechanisms: course direction, which is teaching effort course units (TECU) based; education transition funding; and education innovation funds. These dollars are allocated for the express purpose of paying for costs of the educational program in academic units, including faculty, staff, and teaching assistant compensation, course materials, and other related costs. TECU allocations are currently directed to the primary department of the course director. There will be an opportunity to distribute the course allocations for those courses taught by faculty in multiple departments. At the discretion of the Senior Associate Dean for Medical Education and the Senior Associate Dean for Graduate Education, education transition funding will be available to course directors in academic units to address specific needs and issues arising from the implementation of the new curriculum and operating budget allocation methodology. Finally, at the discretion of the Senior Associate for Medical Education and the Senior Associate Dean for Graduate Education innovation funds will be available for the development of new courses and new approaches to teaching existing courses. All three pools of funding must be used for educational purposes and will be accounted for through the curriculum and teaching evaluation process and budget process.

The faculty census allocation is based on the UTL, MCL, and NTL faculty count in an academic unit as of a specified date. January 1, 2003 will be used for the FY2004 allocation. These funds become part of the unrestricted dollars available to the academic unit to support the full variety of expenses (e.g., faculty and staff compensation, non-compensation expenses) incurred in conducting and supporting the unit's education, research, and patient care activities.

The general allocation is also intended to provide unrestricted funds to the academic unit to support the broad range of expenses associated with education, research, and patient care. The general allocation uses research volume in the academic unit to calculate the allocation. Modified total direct costs (MTDC) are used as the indicator to scale this allocation. The allocation is calculated based on the actual MTDC of the prior twelve months, ending February 28.

The final operating budget allocation is associated with the costs of research space and the facilities component of indirect cost recovery that is intended to recover the research space costs from sponsors. The costs of research space and the revenue associated with facilities through indirect cost recovery are both allocated to the academic unit. The allocation of revenue and expense will be based on the prior year's actual revenue and expense.

The Dean's Office recognizes the impact of changes in funds flow. The changes will result in the need for mitigation funding to accommodate the transition to the new operating budget. The impact of the new operating budget formula and the mitigation will be addressed through the annual budget process. Most importantly this process will recognize the need to support the essential missions of our basic and clinical departments and their importance to the future of the School of Medicine.

I hope that this helps provide some background on what has been going on with the Operating Budget.

Update on SMILE

At the Board of Trustees Committee on the Medical Center meeting on Monday, April 7th, we focused on the important changes underway in the School's education programs. Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, reviewed the exciting changes now underway in renewing the medical student curriculum that will commence in the fall of 2003. In addition, Ms. Maggie Saunders, Program Planner for the Stanford Medicine Information and Learning Environment (SMILE) gave an update on the program developments underway for this exciting new facility that we hope will house the School's programs for the education and training of medical and graduate students, fellows, residents, faculty, continuing medical education and our community. We view SMILE as an environment for learning, a knowledge management center, a hub for the School of Medicine, a "place" for students, a resource for faculty and the SUMC community and a forum for the community of biomedical scholars. We are currently working on the planning for this new facility that we hope will open in 2008.

In her presentation, Ms. Saunders reviewed the exciting programs for Interdisciplinary Learning (case based), Information Intensive Ecology (basic science), Immersive Learning (skills), Library and Knowledge Management (information and technology), Student Life, Student Support Services and Conference Center. A slide show that describes these conceptual programs is available by accessing <https://www.med.stanford.edu/deansletter/smile/>. A SUNet ID is required to gain access to the slide show. I think it is worth viewing and we would certainly be interested in your comments and suggestions.

Town Hall Meeting on Cancer Research and Care at Stanford

On Wednesday, April 9th, the first Town Hall Meeting on Cancer Research and Care was held in the Fairchild Auditorium. Dr. Irv Weissman, Beekhuis Professor and Director of the Stanford Cancer/Stem Cell Biology and Medicine Institute, and Dr. Karl Blume, Professor and Associate Director of the Institute, spoke about the plans underway for the future of cancer and stem cell research and cancer treatment at Stanford.

Among the most important messages that were transmitted at the Town Hall Meeting was the goal of making the Institute and cancer research programs as inclusive as possible. Faculty who attended the meeting were encouraged to engage with Drs. Weissman and Blume if they are interested in becoming part of this exciting new initiative.

In addition, Dr. Blume discussed the plans now underway for seeking designation by the NCI as a Comprehensive Cancer Center. Both Dr. Blume and I talked about our recent discussions with the leadership at the NCI and their enthusiasm regarding our application to become a Comprehensive Cancer Center – and especially one focused on technology and innovation. Dr. Blume outlined the 13 program areas he had already identified for possible inclusion in the grant application that could be due as soon as October 2004. Again, input was solicited from the attendees and I would encourage everyone interested in cancer research and care to feel free to contact Drs. Weissman or Blume.

Council of Clinical Chairs Update

At the Council of Clinical Chairs meeting on Friday, April 11th, updates were provided on several important issues:

- This past week the Bond Rating agencies of Standard & Poor and Moody visited Stanford Hospital & Clinics. They listened to presentations about the current and future plans for the Hospital and its important relationships to the School of Medicine. Presentations were given by Denise O’Leary, Chair of the Board of Directors of SCH (and Chair of the Committee on the Medical Center, Stanford University Board of Trustees); Philip Pizzo, Dean of the School of Medicine; Martha Marsh, President and CEO, SHC; Mike Peterson, Chief Operating Officer, SHC; and Roy Santarella, Chief Financial Officer, SHC. A major focus of these presentations was on the relationship and alliance of SHC and the School of Medicine, especially around translational medicine. This association is well characterized by the alignment of the School’s planned Institutes of Medicine and

the Hospital's planned clinical centers of excellence. The Stanford Institutes of Medicine include the Cancer/Stem Cell Institute, and, in the planning stages, the Neurosciences Institute, Cardiovascular Institute, and Immunology and Infectious Disease Institute.

The connection of the Institutes to the clinical programs at SHC was further defined by presentations by clinical leaders including Dr. Alan Yeung (who provided information about the association of the SHC Cardiovascular Center with the School's planned Cardiovascular Institute); Dr. Richard Hoppe (who described the plans for the Clinical Cancer Center and its relationship to the Cancer/Stem Cell Institute and proposed NCI designated Comprehensive Cancer Center); Dr. Gary Steinberg (who explained the exciting progress occurring in neurosurgery and unique clinical programs at Stanford and their relationship to the planned Neurosciences Institute); and Dr. Emmet Keefe (who reviewed the plans for the SHC Organ Transplant Center, which will be connected to the School's planned Immunology and Infectious Disease Institute).

These strategic partnerships between the School and its major affiliated hospitals (similar alignments are present with the Lucile Packard Children's Hospital) offer a distinguishing feature of Stanford Medicine and help define its Strategic Plan of *Translating Discoveries* (<http://medstrategicplan.stanford.edu/>).

- Additional discussion took place updating clinical volume and financial projections. The focus of this was on the need to have current and accurate data. It is recognized that the challenges faced by SHC during the last year, including audits, preparations for the bond hearings and conversion of its general ledger, have made data reporting challenging. However, it was underscored that the lack of current financial and clinical data poses major problems for all – including clinical chairs and faculty as well as hospital leaders. The strong plea was for the data to be made available as rapidly as possible so that decisions and actions by clinical leaders would be optimally informed. Hospital leaders promised to make this happen in the next couple of months – although some aspects of data reporting still appear to be months away.
- Mike Peterson reported that progress continues to be made on the negotiations around the potential SHC ambulatory site on Mayfield Avenue. This is an exciting opportunity and the final details will emerge in the next weeks to months.

Announcements

MEDICINE and the MUSE: An ARTS, HUMANITIES and MEDICINE SYMPOSIUM, will be held on Thursday, May 8th at 5:00 p.m. in the Cantor Center for the Visual Arts Auditorium. It will feature presentations, art, literature and music by Stanford medical students. In addition, the keynote speaker: Abraham Verghese, MD, author of *My Own Country* and *The Tennis Partner* will address "The Search for Meaning in a Medical Life". The symposium is free and

open to the public. In addition, a reception will follow the symposium at 7:00 p.m. For additional details, please contact Sarah Bein SMSII Aureyllia@aol.com or Audrey Shafer, MD ashafer@stanford.edu. Supported by grants from Helen and Peter Bing, The Osher Foundation and The Vera Moulton Wall Center at Stanford. Sponsored by the Arts and Humanities Medical Scholars Program.

Stanford Chemistry and Genomics Symposium, will be held on Thursday, April 17th starting at 9:30 a.m. in the Fairchild Auditorium. Speakers include Chris Walsh, Harvard Medical School; Jim Wells, Sunesis Pharmaceuticals; Michael Tyers, University of Toronto; Roger Tsien, UCSD; Tim Mitchison, Harvard Medical ICCB; Michael Snyder, Yale University; and Ruedi Aebersold, Institute for Systems Biology.

For additional information, please contact <http://molepharm.stanford.edu>.

Emergency preparedness: BAT Training - The University is strengthening its emergency preparedness program to address a number of priority issues previously identified in our annual emergency management exercises. The School of Medicine has made significant progress developing and strengthening its Satellite Operations Centers (SOC). Stanford's goal is to incorporate contingency planning with ongoing academic program planning throughout the University.

In this regard, faculty and staff are encouraged to attend the next Building Assessment Team (BAT) training, scheduled for Tuesday, April 22nd, 7:30-10:00 a.m. in Tressider Union's Oak Lounge. If you have any questions please contact David Silberman (davidhs@stanford.edu).

Awards and Honors

- **Dr. Stanley Falkow**, Robert W. and Vivian K. Cahill Professor, Department of Microbiology & Immunology, has received numerous awards for his remarkable contributions to medicine and science over the years. I wanted to let you know about two of his most recent awards: the *Abbott Lifetime Achievement Award* from the American Society of Microbiology and the *Astra Zenica/Beaumont Award* from the American Gastroenterological Association, both of which he will receive in May. Congratulations again to Dr. Falkow!
- Dr. David Spiegel, Jack, Samuel and Lulu Willson Professor, Department of Psychiatry, has been awarded the Ernest R. Hilgard Award for Scientific Excellence for 2002 by the International Society of Hypnosis. Congratulations to Dr. Spiegel.
- Dr. John Kerner, Professor of Pediatrics, has been awarded the Joseph St. Geme Jr. Education Award from the Western Society of Pediatric Research for his innovative work on nutrition and especially the on-line teaching modules. Congratulations to Dr. Kerner.

- Dr. Ajay Chawla, Assistant Professor in the Department of Medicine, has been selected as a Rita Allen Foundation Scholar. This is a highly competitive award and gives evidence of Dr. Chawla's promise as an academic physician-scientist. Congratulations to Dr. Chawla.
- Dr. David Stevens, Professor of Medicine (Infectious Diseases and Geographic Medicine) at the Santa Clara Valley Medical Center, has been awarded the 2003 "Outstanding Achievement in Medicine Award" from the Santa Clara County Medical Association. Congratulations to Dr. Stevens.

Events

- ***The Third Lawrence Crowley Distinguished Lectureship*** was held on Friday, April 4th. This Lectureship honors Dr. Crowley whose guidance helped to shape Stanford Medicine through his leadership as Vice President for Medical Affairs and President of Stanford University Hospital. This year's lecturer was Dr. Lucien Leape, Adjunct Professor of Health Policy at the Harvard School of Public Health. Dr. Leape has had a distinguished career as a pediatric surgeon but achieved his greatest notoriety by his seminal studies on medical errors. His work led to the IOM reports "To Err is Human" and "Crossing the Quality Chasm". His lecture was entitled "Making Health Care Safe: Easier Said than Done". It was a most important presentation and it will be available for video viewing very soon.
- ***The Down Syndrome Center*** was officially launched on Tuesday, April 8th. This new interdisciplinary effort has been spearheaded by Dr. Bill Mobley, John E. Cahill Family Professor and Chair of the Department of Neurology, and is made possible with the generous support of Jim and Patty Ann White, Roger and Dawn Kafker and the Larry L. Hillblom Foundation. More than 150 guests attended the reception to learn about the exciting work that is now going on to address the fundamental underpinnings of Down Syndrome and that will, in time, provide hope to children and adults affected by this common congenital disorder. [<http://dsresearch.stanford.edu/>]

Appointments and Promotions

- **M. Kathleen Gutierrez** has been reappointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, 4/1/2003 to 3/31/2006.

Dean's Newsletter

April 28, 2003

SARS and Stanford

In recent weeks concerns about the impact of SARS (Severe Acute Respiratory Syndrome) has been increasing globally. Contacts of medical staff with colleagues in Toronto raise additional concerns since nosocomial spread appears to have occurred despite rigorous isolation procedures. Based on the current data and the increasing concerns about potential impact in the USA, Dr. Lucy Tompkins, Chief of the Division of Infectious Diseases, met with the Council of Clinical Chairs on Friday April 25th and made the following recommendations

- Travel by faculty to the endemic areas (China/Taiwan, Vietnam (especially Hanoi), Singapore, Hong Kong, Toronto) should be strongly discouraged. I recommended this some weeks ago and would argue that such travel should not take place unless the business is officially related to assisting with the SARS efforts. Should faculty decide to travel – or have recently traveled, it is important that on their return, they carefully monitor themselves and not come to work if fever or respiratory symptoms have developed.
- Stanford Hospital & Clinics (SHC) has determined that its employees will not be permitted to travel to endemic areas on hospital-related projects.
- When or if a suspected case of SARS is referred SHC, the evaluation should not occur in the Emergency Department. A special facility is being identified for such evaluations. Please contact the ID service if you are aware of a patient coming for evaluation so that appropriate precautions can be taken.
- If a patient is admitted for SARS evaluation or treatment, they will be cared for in a special facility (likely G1/H1).
- Health care workers who have contact with suspected SARS patients will be required to wear isolation suits, goggles, N95 masks, double gloves, etc. Again, the ID service and Infection Control will provide details as appropriate.
- Additional precautionary methods and procedures are being developed by an expert panel and these will be announced shortly.
- New referrals of international patients will be deferred until appropriate protocols for handling such patients have been further defined.
- Appropriate precaution signage providing guidance to visitors and staff will be posted at entry points to the Hospital and Clinics.

It is clearly incumbent on all of our Stanford community to exercise appropriate vigilance and caution. Questions should be directed to the ID service.

A Curriculum by any Other Name

We need your help. As you know, we are making significant progress with our new and evolving curriculum for medical education. Indeed, Senior Associate Dean for Medical Education, Dr. Julie Parsonnet, who is working closely with the Faculty Senate, is confident that significant components of the new curriculum will commence with the arrival of our incoming medical student class this fall.

We are, however, lacking a name that defines our curriculum and that raises excitement – and indeed questions – about what we are doing and why. In the early 1960's, the then new curriculum was commonly referred to as the “Stanford Plan” or the “Stanford Five Year Plan”. In the interim, the unique character of the Stanford Curriculum has been more tempered.

So we need your help with a name for our new curriculum. You will recall that the new curriculum will be characterized by parallel training in both basic and clinical medicine throughout the years of medical school; an attempt to reduce the burden of new knowledge to a more manageable quotient and with the view of creating a path to life time learning; and, the opportunity for scholarly concentrations (or majors) permitting students to engage in original research and/or investigation.

Our goal is to have our medical student graduates be excellent clinicians but also leaders, scholars, investigators and advocates. How to best characterize our new curriculum is where we need your input. We have entertained names like the “Frontiers Curriculum” to the LEAD Curriculum (Learning to Explore, Advocate and Discover)” but we have not found a name that achieves either consensus or excitement. Please share any thoughts for names of our new curriculum with me. We need your help!

Stanford Medical School Events

The last weeks have been hallmarked by some wonderful annual or first time events by Stanford Medical School Faculty. I am mentioning a handful of them in this Newsletter because of their special importance and value to the community.

Beckman Symposium

On April 14-15, the 13th Beckman Symposium was held in the Fairchild Auditorium on “Stem Cells, Regenerative Medicine, and Cancer”. Thanks to the symposium organizers, Drs. Irv Weissman and Seung Kim, a spectacular group of faculty speakers was assembled to update the packed audience on cutting edge results in stem cell biology. Additional recognition must go to Dr. Lucy Shapiro, Director of the Beckman Center, and Ms. Belinda Byrne for their work in making this event so successful. In addition to discussing the science and potential translational applications of these important discoveries, a review of the controversies surrounding this important field was discussed in a panel moderated by Dr. Irv Weissman that included Drs. Paul Berg, Margaret Fuller, Harold Varmus, Rudolf Jaenisch, M. Azim Surani, James Thomson and Linda Giudice.

As you know, we have committed ourselves to focusing on this important area of research through the creation of the Stanford Institute for Cancer/Stem Cell Biology and Medicine that is directed by Dr. Irv Weissman. We believe that enormous opportunities exist for understanding cancer and other genetically mediated diseases through the use of nuclear transfer to create new pluripotent stem cell lines. Unfortunately, NIH support for this research is not currently permitted, due to a current federal policy, announced in August 2001, that restricts federal funding for research to stem cell lines that were in existence at that time.

Although research on nuclear transfer to develop pluripotent stem cell lines can not currently be funded by the NIH, it has considerable promise for developing new treatments for cancer, heart disease, spinal cord injuries and other devastating diseases. The two seemingly disparate fields of cancer and stem cells are united by the fact that both stem cells and cancer cells have the remarkable ability to divide indefinitely. Studying the process by which stem cells grow and divide will provide insight into the biology of malignant cells. This knowledge can help guide approaches to blocking or correcting the abnormalities that take place when a cell changes from normal to malignant. In addition, normal stem cells can play a direct role in treating cancer by replacing cells damaged by chemotherapy or radiation treatment.

Absent a policy change to provide federal funding support to develop new stem cell lines or utilize nuclear transfer, progress will assuredly be slowed in the United State and probably accelerated around the world.

It also is important to remember that similar concerns were voiced twenty five years ago when genetic engineering permitted medical researchers to insert human genes into bacteria. However, with appropriate oversight new research led by Dr. Paul Berg and others was allowed to continue and has resulted in numerous new therapies for human disease. Stem cell research has even greater potential. If the federal government does not act to support research that has the potential to generate similar dramatic improvements in human health, the nation may pay a terrible price in lost opportunities to fight cancer and other catastrophic diseases. We clearly need to sustain our advocacy for supporting stem cell research.

Stanford Chemistry and Genomics Symposium

On April 17th the Stanford Chemistry and Genomics Symposium was held for the first time in the Fairchild Auditorium. Directed by Tobias Meyer and Bisera More, an impressive faculty was gathered to address a packed auditorium that addressed cutting edge science. There seems little doubt that this will become an annual event.

I had the privilege of joining with Dr. Marvin Classman, Director of the QB3 Program to address the exciting opportunities that are unfolding in interdisciplinary research at Stanford and in the UC system. There is little doubt that the efforts underway at Stanford in BioX and Bioengineering, as well as our focus on translational medicine and the Stanford Institutes of Medicine, are stimulating an environment that is bringing together biologists, medical scientists, engineers, computer scientists, physicists, chemists and

others to address the revolution underway in the biosciences. I truly believe that the programs at Stanford are nonpareil, largely because the faculty and students are interested and committed to exploring the important interfaces and new opportunities that lie at the intersections of traditional disciplines. It is encouraging to also hear about the progress being made in the QB3 project. Given these efforts it seems likely that California will take an important lead in the new fields of systems biology and translational medicine.

From Stem Cells to Breakthrough Therapies: A Mini-Course in Medicine

On Monday evening April 21st, the School of Medicine held a mini-course in medicine that attracted over 250 members of our community – both within and outside the University. Following an introductory lecture by Dr. Irv Weissman, Beekhuis Professor of Pathology and Director of the Stanford Institute for Cancer/Stem Cell Biology and Medicine, the attendees had the option to attend one of eight small group lectures and discussion groups lead by a prominent faculty member. Our speakers included Drs. Paul Berg, Helen Beau, Karl Blume, Mike Cleary, Seung Kim, Ron Levy, Joe Lipsick and Theo Palmer. I want to thank each of them for the terrific jobs they did.

The feedback we have received already about this mini-course in medicine has been spectacular and we intend to make this a regular event. It is clear that our community is eager to learn more about the exciting work taking place at Stanford – and I am quite sure that the more we can engage and educate our community about biomedical research and translational medicine, they better prepared they will be to advocate for Stanford Medicine in the future.

Jeffrey Modell Foundation Symposium on Primary Immunodeficiencies

Thanks to the support of Fred and Vickie Modell, who founded the Jeffrey Modell Foundation in memory of their son who died from a primary immunodeficiency disorder, a special symposium was held on Friday April 25th to educate the community on the approach to the diagnosis, management and treatment of primary immunodeficiency disorders. Dr. David Lewis, Associate Professor of Pediatrics and Director of the Division of Infectious Disease, chaired this event that featured internationally recognized authorities in this field. While primary immunodeficiency disorders are rare, their study has contributed an enormous amount of knowledge and insight into the immune development and function – as well as dysfunction.

Notification of Future Lectures and Meetings

Being aware of upcoming lectures and events can be difficult to say the least. Thanks to Praveen Morusupalli, Kevin Boyd, Michael Halaas, Henry Lowe, and members of the Information Resources and Technology group, a central website has been set up that will contain all of the upcoming events and lectures at Stanford Medicine. You can access it now at <http://www.med.stanford.edu/seminars/>. In the near future, you will receive the information by email daily (should you choose to subscribe) – and I am confident this will be a great service and benefit to our community. Thanks to John Boothroyd and everyone who worked on this important initiative.

Town Hall Meeting for Postdoctoral Fellows

On Wednesday April 23rd, the Annual Postdoc Town Hall Meeting was held in the Fairchild Auditorium. Thanks to the leadership of Drs. Mark Siegal, Karen Christopherson, and Maureen Fitch-Bruhns, considerable progress has been made to assist postdoctoral scholars during the past couple of years. The SUPD (Stanford University Postdoc) organization has developed an email listing for all current postdocs, has initiated a social committee to bring the community of postdocs together and has created a postdoc advocacy committee. Importantly, the SUPD has worked with the Dean's office to improve salary and benefits levels for postdocs. And while there is much left to accomplish, it is clear that progress has been made to improve the lives and well-being of postdocs at Stanford. Given the importance that this community of scholars has to our research, education and patient care missions, it is essential that their value be acknowledged and rewarded.

In addition to the work going on through the SUPD, Karen Christopherson discussed the role of the National Postdoctoral Association that she has helped to found. The NPA seeks to provide a voice for postdoctoral scientists, elucidate the "best-practice" policies for postdocs based on experiences at different institutions and work collaboratively with government agencies and professional organizations to advocate for improvements in postdoctoral policies. You can find out more about the NPA through the website: <http://www.nationalpostdoc.org>

I want to thank again the leadership role that Drs. Siegel, Christopherson and Fitch-Bruhns are playing both at Stanford and nationally to address important issues that affect the quality of life and training opportunities for postdoctoral scholars

Awards and Honors

- **Dr. Michael Cleary** has been named the first holder of the Lindhard Family Professorship in Pediatric Cancer Biology. A world-renowned expert in cancer genetics, especially regarding leukemias, Dr. Cleary has made fundamental contributions to elucidating the role of primary mutations in the pathogenesis of leukemia. He is also recognized for establishing the first molecular diagnostics laboratory at Stanford. He is currently a professor of pathology and pediatrics and serves as the director of the cancer biology program within the Center for Cancer and Blood Diseases at the Lucile Packard Children's Hospital. Congratulations to Dr. Cleary.
- **Dr. Axel Brunger**, Professor of Molecular & Cellular Physiology and of Neurology & Neurological Sciences, has been named the co-recipient of the Gregori Aminoff Prize for 2003 "for his development of refinement techniques for macromolecules". The Gregori Aminoff Prize is awarded by the Royal Swedish Academy of Sciences and is intended to reward a documented, individual contribution in the field of crystallography, including areas concerned

with the dynamics of the formation and dissolution of crystal structures. The Aminoff Prize was awarded for the first time in 1979. The laureates will receive the prize at a ceremony at the Royal Swedish Academy of Sciences in Stockholm on September 10, 2003. Congratulations to Dr. Brunger.

- **Dr. Linda Cork** has been named the Chairperson of the Board of Directors of the California Biomedical Research Association. Congratulations to Dr. Cork.
- **Provost Honors Award Winners.** On Tuesday April 22nd, Provost John Etchemendy held a Faculty Reception at the Hanna House honoring major award recipients and faculty elected to national academies during the past 18 months. Faculty throughout the University were honored and among them, members of the School of Medicine featured prominently. They included:
 - **William Newsome, Professor of Neurobiology** : 2002 American Psychological Association Distinguished Scientific Contribution Award
 - **Patrick Brown, Professor of Biochemistry**: Elected to the National Academy of Sciences
 - **Michael Levitt, Professor of Structural Biology**: Elected to the National Academy of Sciences
 - **Roger Kornberg, Professor of Structural Biology**: Welch Prize in Chemistry
 - **Roeland Nusse, Professor of Developmental Biology**: Elected to the American Academy of Arts and Science
 - **Christopher Garcia, Assistant Professor of Microbiology and Immunology and of Structural Biology**: Distinguished Young Scholar Award from the Keck Foundation
 - **Linda Giudice, Stanley McCormick Memorial Professor in the School of Medicine** : Elected to the Institute of Medicine of the National Academy of Sciences
 - **Richard Kempson, Professor of Pathology, Emeritus**: Elected as Fellow to the American Association for the Advancement of Science
 - **Eric Knudsen, Edward C. and Amy H. Sewall Professor in the School of Medicine**: Elected to the National Academy of Science
 - **Michael Moseley, Associate Professor of Radiology**: International Society for Magnetic Resonance in Medicine Gold Medal
 - **Randal Pham, Adjunct Clinical Educator**: Best Clinical Science Award from the American Society for Laser Medicine and Surgery
 - **Eric Shooter, Professor of Neurobiology**: Elected to the American Philosophical Society
 - **Kelly Skeff, Professor of Medicine**: Abraham Flexner Award in Medical Education from the Association of American Medical Colleges
 - **Peter Small, Assistant Professor of Medicine**: Princess Chichibu Memorial TB Global Award for 2002

- **Lubert Stryer, Mrs. George A. Winzer Professor of Cell Biology :** Molecular Bioanalytics Prize from the German Society for Biochemistry and Molecular Biology
- **Irving Weissman, Karel and Avice Beekhuis Professor of Cancer Biology, Professor of Pathology and Developmental Biology:** Elected to the Institute of Medicine of the National Academy of Science
- **Michael Marmor, Professor of Ophthalmology:** Best Clinical Science Award from the American Society for Laser Medicine and Surgery

Congratulations to all – and to other faculty who achieved honors and awards during the past year.

- ***Students Awarded Research Training Fellowships***

Five of our medical students were awarded Howard Hughes Medical Institute Research Training Fellowship for Medical students to work at Stanford:

- **Andrew Kopelman, MS II** will be working with Dean Felsher, MD, PhD, Department of Medicine (Oncology) – investigating Myc’s role in tumorigenesis using a novel *in vitro* system to titrate oncogene expression.
- **Theodore Leng, MS III** will be working with Mark Blumenkranz, MD and Harvey Fishman, MD, Department of Ophthalmology - designing a means to correct for macula degeneration.
- **Robin Price, MS III** will be working with Theo Palmer, PhD, Department of Neurosurgery - investigating the effects of perinatal ischemia on neuron stem cell functions and brain development.
- **Giridhar Shivaram, MS II** will be working with Christopher Jacobs, PhD, Department of Mechanical Engineering and Department of Orthopedic Surgery - investigating oscillatory fluid flow and gene expression in mesenchymal stem cells.
- **David Wang, MS III** will be working with Michael Dake, MD, Department of Radiology - determining the relative roles of proliferation and lesions related to in-stent restenosis.

A sixth medical student was awarded a Howard Hughes Medical Institute Research Training Fellowship for Medical Students to undertake research at the University of California, San Francisco Cancer Center:

- **Peter Jun, MS II** will be working with Dr. Joseph Costello --investigating the epigenetic mechanism of tumor growth -utilizing the excellent resource of material at the Neurosurgery Tumor Bank at UCSF.

Announcements:

Stanford Medical Student Research Symposium

On Thursday, May 1st, the Twentieth Annual Stanford Medical Student Research Symposium will be held in the Dean’s Courtyard and in classrooms M104 and M106. At 1:00 p.m. the symposium will be opened by Dr. Julie Parsonnet, Senior Associate Dean

for Medical Education, and this year's keynote speaker will be Dr. Phyllis Dennery, Associate Professor of Pediatrics. Students will give oral presentations as well as poster presentations of their work. At 4:30 p.m., Dr. Pat Cross, Associate Dean for Medical Student Research and Scholarship will provide an overview of the symposium followed by award presentations by Dr. Ross Bright, Associate Dean for Alumni Affairs.

This promises to be a terrific event and I hope you will join our students for this year's Research Symposium.

New Core Labs Open

The Stanford Functional Genomics Facility (SFGF) and the Stanford Tissue Bank have recently moved into newly completed core laboratory space on the ground floor of the North wing of the CCSR building.

The SFGF manufactures DNA microarrays for Stanford investigators, and provides associated technology support for their use. For additional information, visit their website at <http://www.microarray.org/>. The Tissue Bank provides tissue acquisition and banking services to Stanford investigators using human tissues for their research, in compliance with local, State and Federal guidelines. For additional information, go to their website at <http://tissuebank.stanford.edu>.

You are invited to view the new facilities and learn more about these core resources at their co-hosted open house, on May 22nd from 11:00 am – 2:00 pm, in CCSR 0107; food and refreshments will be served.

Women's Health @ Stanford presents the 2nd Annual Women's Wellness Conference and Health Fair: *Transforming Stress Into Wellness*. This will be held on Saturday, May 10, 2003, 8:00 a.m. - 5:00 p.m. at the Fairchild Auditorium at Stanford University Medical Center. The keynote address will be given by Dr. Robert M. Sapolsky. Admission fee payable at the door: \$50. For additional information and registration see the appended announcement, below.

Appointments and Promotions

- **Janice Brown** has been reappointed to Assistant Professor of Medicine (Bone Marrow Transplantation) at the Stanford University Medical Center, effective 4/1/2003 to 3/31/2006.
- **Hayes Gladstone** has been appointed to Assistant Professor of Dermatology at the Stanford University Medical Center, effective 4/1/2003 to 3/31/2006.
- **Jeffrey Gould** has been appointed to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 4/1/2003 to 3/31/2008.
- **Henrikus Lemmens** has been reappointed to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 5/1/2003 to 4/30/2004.
- **David Lee** has been reappointed to Assistant Professor of Medicine (Cardiovascular Medicine) at the Stanford University Medical Center, effective 4/1/2003 to 3/31/2006.

- **Ashima Madan** has been promoted to Associate Professor of Pediatrics (Neonatology) at the Lucile Salter Packard Children's Hospital, effective 4/1/2003 to 3/31/2008.
- **Christopher Ta** has been reappointed to Assistant Professor of Ophthalmology at the Stanford University Medical Center, effective 4/1/2003 to 3/31/2004.

-----ANNOUNCEMENT-----

*Women's Health @ Stanford Presents
2nd Annual Women's Wellness Conference and Health Fair:
Transforming Stress Into Wellness
Saturday, May 10, 2003, 8:00 a.m. - 5:00 p.m.
Fairchild Auditorium at Stanford University Medical Center
Admission fee payable at the door: \$50*

A unique opportunity to gain insight from top Stanford experts about some of the stress and health issues that affect women today. Come discover the latest in mind and body health as we present a day of lectures, demonstrate stress reduction methods, and showcase a health fair, this Mother's Day weekend. Interact and share experiences with other women. Leave inspired to turn your stress into wellness!

Keynote address: Robert M. Sapolsky, Ph.D.

Robert M. Sapolsky has been called "one of the best scientist-writers of our time" and "the world's funniest neuroscientist". Dr. Sapolsky is professor of biology and neurology at Stanford University and a research associate with the Institute of Primate Research, National Museums of Kenya. He spends each summer in the Serengeti of East Africa to study the relationship between social hierarchy, personality, and stress-related diseases in baboons, leading to the discovery that sustained stress can damage the hippocampus, a region of the brain central to learning and memory. He is the author of *The Trouble with Testosterone*, *Why Zebras Don't Get Ulcers*, and *A Primate's Memoir*. A regular contributor to *Discover* and *The New Yorker*, and a recipient of a MacArthur Foundation genius grant, Dr. Sapolsky is a fascinating, lively, and engaging speaker.

Topics will include:

Stress and the heart
Abuse, stress, and health
Stress reduction, simplicity, and barriers to change
Qi gong
Massage
Mindfulness meditation
Forgiveness
Spirituality and wellness
Imagery for stress reduction

Door prizes from great local businesses to be given away. Lunch and refreshments will be served.

Career Closet Clothing Drive: Bring your donation of clean women's business clothing, on hangers, and receive \$10 off your admission fee. See www.careercloset.org for details.

Admission fee payable at the door: \$50. **Space is limited, reservations are required.** Please call Jill at (650) 724-1824 or email jlazear@stanford.edu to reserve your space no later than **May 5**.

Dean's Newsletter

May 12, 2003

Twentieth Annual Stanford Medical Student Research Symposium

Thursday, May 1st marked the Twentieth Annual Stanford Medical Student Research Symposium. Concordant with Stanford's pre-eminence as a leading research-intensive school of medicine, students demonstrated their remarkable interests and diversity in 24 oral presentations and 23 poster presentations. As has been the case in past years, many of these presentations have already resulted or will result in peer-reviewed publications. I want to commend each of the students who gave presentations as well as the faculty who mentored and supervised their work and progress.

This year oral presentations were given by: Jason Davies, Ryan Louie, Emily Tierney, Daniel Chao, Mauricio Vargas, Mariel Velez, Alyssa Brewer, Valerie Coon, Vikam Udani, Benjamin Hoehn, Michelle Monje, Una Lee, Adia George, Brian Courtney, Bryan Warne, Marie Nguyen, Elissa Meites, Everett Meyer, Jennifer McIntire, Yolanda Agredano, Christine Jacobson, Dustin Bermudez, Jamie Dermon and Kristine McCoy.

Poster presentations were done by Unzlia Ali, Keith Chan, Josephine Chu, Noah Epstein, Megan Fix, Mana Golzari, Christine Jacobson, Matthew Kirschen, Vendat Kulkarni, Eliza Long, Mina Matin, Kristine Meade, Pamela Mosher, Jessica Ngo, Josephine Nguyen, Svetlana Pilyugina, Gordon Sakamoto, Thomas Satterwhite, Matthew Simmons, Glenn Valenzuela, Melanie Watkins, Naveen Yalamanchi and Andrew Zhang.

While each of these students deserves our praise, six were singled out for special mention and recognition. These included:

Oral Presentations:

- **First Place: Ryan Louie SMS 3:** “APC and EB1 proteins are integral components of mammalian centrosomes and EBI affects microtubule polymerization from centrosomes”. Collaborators include Kathleen Siemers, Shrin Bahmanyar, Violet Votin, Paul Chang, Tim Stearns, W. James Nelson and Angela IM Barth. Department of Molecular and Cellular Physiology
- **Second Place (tie): Bryan Warme SMS 3:** Chemokine and cytokine expression in a novel murine model of biomaterial induced osteolysis. Collaborators include NJ Epstein, MCD Trindade, K Miyanishi, T Ma, SB Goodman and R Lane Smith, Department of Orthopedic Surgery
- **Second Place (tie): Everett Meyer SMS 2:** “Critical Role of NKT cells in the development of allergen induced airway hyperreactivity”. Collaborators include Omid Akbari, Philippe Stock, Mitchell Kronenberg, Stephanie Sidobre, Toshinori Nakayama, Rosemarie DeKruyff and Dale Umetsu, Department of Pediatrics

Poster Presentations:

- **First Place: Matthew Simmons SMS 4:** “Clinical assessment of lymphocytic HO-1 and P450E1 levels as indicators of oxidative endothelial injury” Collaborators include James Oliver, David Webb and Stanley Rockson, Department of Medicine
- **Second Place (tie): Matthew Kirschen, SMS 3:** “Load dependent increases in cerebellar activation during verbal working memory: An FMRI investigation”. Collaborators include S Annabel Chen and John Desmond, Department of Radiology
- **Second Place (tie): Pamela Mosher SMS 2:** “Simulation-based training: A new model for medical student education on death/dying and delivering difficult news”. Collaborators in clued Louis Halamek, Allison Murphy, JoDee Anderson, Mary Coyle, Jennifer McCauley and Kristi Boyle, Department of Pediatrics

Again, congratulations to all!

Medicine and the Muse

Not only are we fortunate to have students with outstanding scientific accomplishments, we are also the beneficiaries of students who are accomplished in the arts and humanities. (And we haven’t even gotten to athletic pursuits yet!) On Thursday, May 8th our students had the opportunity to share their work and achievements in “Medicine and the Muse: An Arts, Humanities and Medicine Symposium” that was held before a packed audience in the Cantor Arts Center Auditorium. To a great degree, this venue has been made possible because of the vision and commitment of Dr. Audrey Shafer, Associate Professor of

Anesthesia and Chair of the Stanford Arts & Humanities Medical Scholars Committee. I had the pleasure of attending the symposium and was deeply impressed by the talents of our students in their presentations as well as in the artwork that was displayed. Quite amazing.

Following an introduction by Sarah Bein, SMS 2, the keynote address entitled “The Search for Meaning in a Medical Life” was given by Dr. Abraham Berghese, Director of the Center for Medical Humanities and Ethics at the University of Texas Health Science Center at San Antonio. This was followed by a series of outstanding presentations or performances including:

- **Rosalyn Nguyen SMS 3** presented an amazing and artistically beautiful website she has constructed called “Embracing the East: Fostering Cultural Sensitivity and Understanding in Asian Health Care.”
- **David Myung SMS 2** showed excerpts from a comic book he has produced called “Andy Vesalius, Kid Professor” that speaks volumes to children facing the challenge of cancer.
- **Aparajita Sohoni SMS 2** shared moving stories she collected during a recent trip to India entitled “Crossing Over.”
- **Neva Howard SMS 3 and Rebecca Rakow SMS 2** were joined by friends Tina Minn and Mark Fish to perform the first movement of Shostakovich’s “The War Quartet” entitled “Calm Unawareness of the Future Cataclysm.” The preview given by Neva helped put the performance into perspective to its time of composition as well as to our current world challenges.
- **Simon Hanft SMS 2** shared both analysis and poetry in his presentation entitled “Constrained to Throb: The Assimilated Influence of Keats in the Poetry of William Carlos Williams.”
- **Jennifer Johnsen SMS 5+** presented “Tomorrow’s Physicians: An Insider’s Perspective on Humanistic Medicine.”
- **Nicholas Rubashkin SMS 5+** showed excerpts of a film entitled “Update on What I Learned in Medical School: Personal Stories of Young Doctors.”
- **John Nuguyen SMS 5+** sang a song describing an encounter with Janis Joplin called “Chelsea Hotel, Celina Maria.”
- **Feyza Marouf SMS 5+ and Rachel Mory SMS 5+** showed excerpts from a film they produced called “Anatomy.”
- **Peter Peng SMS 5+** showed excerpts of a film chronicle of a visit to Haiti entitled “Vodou and the Cultural Context of Medicine in Haiti.”
- **Shannon Moffett SMS 4** announced that the project she presented last year “Mind/Matter: A Biography of the Brain” that describes perspectives of individuals in various disciplines who work on the brain will be published.
- **Gina Perez-Baron SMS 2** read a moving poem she wrote entitled “Stutterer.”

In addition to the presentations, exhibits included photography by **Sara Bein SMS 2, Bill Bragg SMS 1, Anne Braun SMS 1 and Paul Johnston SMS 5+** as well as paintings by **Andrew Kopelman SMS 2, Mana Golzari SMS 2, Kubinne Kim SMS 4, Michelle Lai SMS 3, John Nguyen SMS 5+** and sculpture by **Catherine Mohr SMS 2**.

Thanks and congratulations to all!

Hospital Updates

Our major hospital affiliates; Stanford Hospital & Clinics (SHC) and the Lucile Salter Packard Children's Hospital (LPCCH), each had Board of Directors meetings during the past two weeks.

SHC met on May 1st. A major focus of the Board meeting was on strategic planning and facilities development. Specifically, the SHC leadership addressed the plans for further developing the clinical centers in cancer, cardiac, neuroscience, and transplantation as related to the School's Institutes of Medicine. One of the immediate challenges facing SHC is that in-patient volumes have been tracking below those projected, in part related to faculty (in part due to the shift of patients to ambulatory care settings and the impact of the Waverly Surgicenter on certain services, including orthopedics and GI endoscopy). The percentage drop for in-patient admissions has been even more notable for community physicians and the Palo Alto Medical Clinic. Clearly this is an area that requires attention.

Ms. Martha Marsh, President and CEO of SHC, updated the Board (and on Friday, May 8th the Council of Clinical Chairs received a similar message from Michael Calhoun, VP for Strategic Planning and Business Development) regarding an off-campus site as a potential future locus for selected ambulatory care. During the next several weeks those ambulatory services at SHC that would benefit from a move to this very attractive off-site area will be identified. The major factors will be improved patient services as well as a financial model that is beneficial to the hospital and the clinical practices. The details regarding this are now under development.

Further, Ms. Marsh noted that with the recent bond ratings (which have gone well for SHC) plans are being developed for the internal facilities improvements that are necessary to meet important strategic initiatives. Details will follow in the months ahead.

On Wednesday, May 7th the LPCCH Board of Directors convened a mini-retreat to continue discussions on the strategic plan that has been evolving during the past 2-3 years. Currently LPCCH faces significant challenges by not having enough in-patient bed capacity to meet patient demands from the local as well as broader referral community. Over the past year remarkable progress has been made in developing the Heart Center and the Johnson Center for Neonatal & Maternal/Fetal Health and continued work is underway in further developing other key centers including Cancer, Brain & Behavior, Transplant/Tissue Engineering and Pulmonary/Cystic Fibrosis. Ms. Cynthia Haines, Senior Vice President for Business Development and Strategic Planning, reviewed the progress that has been made in these areas and outlined a long range plan that will better rationalize and regionalize the care of children with complex medical disorders in the greater northern California area. A key aspect of this plan is also attending to the care of children within the local community who use LPCCH as their primary hospital facility. Thus, balancing the needs of serving the community while also becoming a national and

international leader in pediatric healthcare represents one of the important challenges facing LPCH and Stanford during the years ahead. Importantly, plans have been developed to address these issues.

In tandem with the clinical program development, Dr. Alan Krensky, Shelagh Galligan Professor of Pediatrics and Executive Director of the Children's Health Initiative (CHI), gave a progress report on the CHI and the important role it is playing in helping to bolster LPCH in achieving both preeminence and sustainability. Dr. Krensky also delineated some of the important recruitments that have been accomplished during the past year or that are now underway, noting that LPCH/Stanford has now become an institution that leaders in pediatrics want to be associated with.

In addition, I gave an overview of the Strategic Plan of the School of Medicine (<http://medstrategicplan.stanford.edu/>) and highlighted how closely linked aspects of the School's plan are to the work underway through the CHI and LPCH. These strategic alliances in research, education and patient care, especially related to the relationships of the Stanford Institutes of Medicine with the clinical centers being established at LPCH, afford a unique opportunity to foster translational medicine and discovery to further improve the care and lives of children.

As with SHC and the School, current facilities at LPCH represent one of the challenges limiting institutional progress and success. Mr. Dawes, President and CEO of LPCH, reviewed the plans for internal renovation that have been defined to help alleviate some of the short-term problems and delineated some of the longer term issues that will require consideration by the Board and other governing groups.

Alumni Weekend

Thursday, May 1st – Saturday, May 3rd was Stanford Medicine Alumni Reunion Weekend. Despite the unusually inclement weather (now I am really beginning to sound like a Californian!) over a hundred alumni gathered for various class events, seminars, tours and social interactions. Special thanks must go to Dr. Newton Harband, M.D. '66 who served as this year's SMAA President and who was instrumental in arranging a wonderful weekend of special events. Among these was a symposium held on Saturday morning, May 3rd featuring Stanford leaders in Oncology. I had the pleasure to be part of that symposium and addressed the progress made in pediatric oncology during the past several decades. Other speakers included Robert Carlson M.D. '78, who spoke on recent advances in the management of breast cancer, and Steven Hancock, M.D. '76, who addressed the application of new technologies for prostate cancer. In addition Ron Levy, M.D. '68, spoke on the immune system and cancer (a field he has pioneered) and Irv Weissman, M.D. '65, spoke on cancer and cancer stem cells. Altogether it was a very impressive event.

Special thanks for making the Alumni Weekend so successful also go to Dr. Ross Bright, Associate Dean for Alumni Affairs, as well as Andy Cope, John Hopkins, Nancy Schlegel and Amanda Keris.

Medical Student Admit Weekend

At the same time that Alumni were visiting and reminiscing about the happy years they spent as Stanford Medical Students, the Office of Student Affairs and Admissions Office welcomed over 70 students who have been admitted to the 2003 incoming class and who visited the campus to determine whether Stanford will be their new home. According to Dr. Gabriel Garcia, Associate Professor of Medicine and Director of Admissions, this was the largest turnout for an Admit Weekend we have ever had and reflects the considerable interest of students in attending Stanford. Among the major areas of excitement is our new curriculum, which has captured the interest and excitement of both current and future students. In addition to reading about the new curriculum in past newsletters and as part of our Strategic Plan, there is a nice description of it in the April 30th issue of the Stanford Report (<http://news-service.stanford.edu/news/2003/april30/curriculum.html>).

Third Annual Founders Dinner

On Wednesday evening, April 30th the Lucile Packard Children's Hospital celebrated its Third Founders Dinner to recognize the various individuals who have played such an important role in helping launch and sustain LPCH. A special feature of the evening was a presentation by Dr. Paul Fisher, Assistant Professor of Neurology, Pediatrics and Neurosurgery and Director of the Pediatric Brain Tumor Program. Dr. Fisher highlighted some of the progress that has been made in treating pediatric malignances as well as some of the limitations in advancing progress for brain tumors. His presentation was made even more meaningful by the presence of two of his patients, each reflecting on the impact that cancer has had on them and their families. These moving personal reflections and portraits underscored why pediatric research and care are so important and why we should be proud to be associated with outstanding physicians like Paul Fisher and institutions like LPCH.

Honors and Awards

- ***Dr. Roger Kornberg, Mrs. George A. Winzer Professor of Structural Biology***, is the recipient of the 2002 Cancer Research Award of the Pasarow Foundation "for his pioneering studies of the cellular processes by which DNA is copied into RNA, a process termed transcription. He and his collaborators discovered the fundamental unit of DNA organization, called the nucleosome, and found that it plays a major role in the process of transcription. They discovered almost all of the more than 60 proteins that form the machinery for transcription; determined how they fit together in a giant assemblage to execute the process; explicated how they receive and respond to signals from the body and the environment; and demonstrated the details of the act of genetic readout from DNA. The work will facilitate understanding of transcription and its relationship to cancer and provides new approaches to therapy."

- **Dr. Greg Barsh, Professor of Genetics and of Pediatrics**, received the 2003 E. Mead Johnson Award for Excellence in Pediatric Research at the annual meeting of the Pediatric Academic Societies, on Monday, May 5th for his pioneering work in mouse genetics and its relevance to human disease.
- **Dr. Dan Bernstein, Professor of Pediatrics**, gave the Presidential Address at the Society of Pediatric Research meeting on Monday, May 5th and highlighted the importance of interdisciplinary research and education in biomedicine and the future of pediatrics. His presentation was truly outstanding.
- **Dr. Tom Krummel, Emile Holman Professor and Chair of the Department of Surgery**, received the Distinguished Alumnus Award from the Medical College of Wisconsin this past weekend. Among his cited contributions is his work in the field of surgical simulation and virtual reality based training that has helped establish a new paradigm nationwide in surgical training and credentialing.
- **Dr. Irv Weissman, Karel and Avice Beekhuis Professor of Cancer Biology, Pathology, Developmental Biology and by courtesy, of Biological Sciences**, received the American Diabetes Association's Elliott Proctor Joslin Medal for 2003 at a ceremony in Boston this past week.
- **Dr. Iain Johnstone, Professor of Health Research and Policy (Biostatistics) and of Statistics**, was elected to the American Academy of Arts and Sciences.
- **William Brody, M.D. '70**, and currently President of the Johns Hopkins University, received the Wallace Sterling Award at the Alumni Dinner on Friday, May 2nd for his extraordinary contributions to medicine and science.

Appointments and Promotions

- **Edward Bertaccini** has been promoted to Associate Professor of Anesthesia at the Palo Alto Veterans' Affairs Health Care System, effective 5/1/2003 to 3/31/2008.
- **Sandip Biswal** has been appointed to Assistant Professor of Radiology (Musculoskeletal Radiology) at the Stanford University Medical Center, effective 5/1/2003 to 4/30/2006.
- **John Cooke** has been promoted to Professor of Medicine (Cardiovascular Medicine), effective 5/1/2003.
- **James Ferrell** has been promoted to Professor of Molecular Pharmacology and of Biochemistry, effective 5/1/2003.
- **Amato Giaccia** has been promoted to Professor of Radiation Oncology (Radiation Physics), effective 5/1/2003.
- **Michael Jeng** has been appointed to Assistant Professor of Pediatric (Hematology/Oncology) at the Lucile Packard Children's Hospital, effective 5/1/2003 to 4/30/2006.

- **Denise Johnson** has been promoted to Associate Professor of Surgery (General Surgery) at the Stanford University Medical Center, effective 5/1/2003 to 4/30/2008.
- **Christopher King** has been reappointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 6/1/2003 to 5/31/2007.
- **Yahli Lorch** has been appointed to Associate Professor (Research) of Structural Biology, effective 5/1/2003 to 4/30/2009.
- **Vinod Menon** has been promoted to Associate Professor (Research) of Psychiatry and Behavioral Sciences, effective 5/1/2003 to 4/30/2009.
- **Kent Nowels** has been reappointed to Associate Professor of Pathology at the Stanford University Medical Center, effective 5/1/2003 to 12/31/2006
- **John Pollard** has been promoted to Associate Professor of Anesthesia at the Palo Alto Veteran's Affairs Health Care System, effective 5/1/2003 to 3/31/2008.
- **Javaid Sheikh** has been promoted to Professor of Psychiatry and Behavioral Sciences, effective 5/1/2003.
- **Richard Whyte** has been promoted to Professor of Cardiothoracic Surgery (Thoracic Surgery) at the Stanford University Medical Center, effective 5/1/2003.

Dean's Newsletter

May 26, 2003

Medical School Commencement will be Saturday June 14th

This year we will hold the School of Medicine Commencement Exercises on Saturday June 14th rather than Sunday as has been the case in the past. The events will commence with a luncheon for students, families and faculty at noon on Alumni Green. Participants will line up for the Processional at 1:30 p.m. and the official ceremony will begin at 2: P.M.. This year we are most fortunate to have Dr. Julie Gerberding, Director of the CDC, as our commencement speaker. We will follow the commencement ceremony with a Champaign toast!

Of course the diplomas we hand out to our medical and graduate students on June 14th will not become official until Sunday when the University holds its Commencement Ceremony. The speaker for this year's commencement will be Peruvian President and Stanford Alumnus Alejandro Toledo.

Medical School Faculty Senate Update and the New Stanford Curriculum for Medical Student Education

On Wednesday May 21st the Medical School Faculty Senate held its penultimate meeting of the current academic year. It has been a year of remarkable effort, commitment and progress by the Senate that has led to our New Stanford Curriculum for medical student education, which will commence in September of 2003.

I want to begin by acknowledging and thanking Dr. Oscar Salvatierra, Chair of the Senate and Professor of Surgery (Transplantation) and of Pediatrics (Nephrology) for his incredibly important collaborative leadership. Change is never easy and can sometimes become contentious. However, Dr. Salvatierra kept everyone focused on the important issues – educating and training our next generation of medical students to be outstanding physicians, scientists, scholars and leaders so that they might improve the lives of patients in the decades ahead. I also want to thank each of the course directors for their willingness to engage in creative thinking and make modifications in courses that require sacrifice and commitment. Particularly important to this process has been the work of Dr. Ted Sectish, Chair of the Committee on Courses and Curriculum who has worked selflessly to move the important agenda forward and who worked collaboratively with the Dean's Office. Dr. Julie Parsonnet, Senior Associate Dean for Medical Education has been the creative force in curriculum design and has worked enormously well with the Senate and with students, faculty and staff. Also essential to this process has been Dr. Neil Gesundheit, Associate Dean for Medical Education, along with other members of the faculty and staff throughout the School, including Ms. Betsy Moreno, who has worked diligently to enable the development and initiative of the New Stanford Curriculum.

Support for the New Stanford Curriculum is evidenced by the enthusiasm of our current students. Many expressed their interests in the changes taking place, and especially the scholarly concentrations, at a Town Hall Meeting for medical students that was held on May 21st. This enthusiasm is complemented by the interest of students who have applied to Stanford for the incoming class. According to Dr. Gabriel Garcia, Director of Admissions and Associate Professor of Medicine, we have an outstanding group of students who will arrive this September.

Dr. Parsonnet also announced the Scholarly Concentrations that were selected by the committee chaired by Dr. Gary Schoolnik, Professor of Medicine (Infectious Diseases) and of Microbiology and Immunology and Senior Fellow, by courtesy, at the Institute for International Studies. A large number of proposals were received and reviewed by the committee and eight have been selected for further development as Scholarly Concentrations for this next year. These include scholarly concentrations in:

- Bioengineering
- Biomedical Ethics and the Humanities
- Biomedical Informatics
- Health Services Policy Research
- Immunology
- Molecular and Genetic Medicine
- Public Health and Community Service
- Women's Health

As outlined in previous Newsletters, each Scholarly Concentration will have a curriculum, mentoring and opportunities for original research and scholarly investigation. Many will permit the opportunity to obtain an additional degree.

In addition to these initial eight Scholarly Concentrations, Dr. Parsonnet announced that she and the committee hope that several other opportunities will emerge during the next year including concentrations in Cardiovascular Medicine, Clinical Investigation, Imaging International Health, and Infectious Disease based on proposals that have been reviewed by the committee. Further, Dr Parsonnet indicated that she is hoping to stimulate development of Scholarly Concentrations in Medical Education and in Neuroscience.

Taken together, the range of Scholarly Concentrations slated for initiation this Fall or later next year offer an enormous breadth and depth of opportunities for medical students. As experience accrues and programs are further strengthened, there seems little doubt that Stanford medical students will have truly unique opportunities to develop skills and knowledge in areas of interest to them. Moreover, these programs will permit students to emerge as scholars, leaders and advocates.

To permit the introduction of the Scholarly Concentrations, additional changes in the curriculum are being made. These changes will focus on defining the essential knowledge students will need for both an introduction to medicine as well as for lifetime learning. For the class arriving this Fall quarter, which will begin on September 2nd this year, a new and very exciting course on the **Molecular Foundations of Medicine** will be taught under the direction of Dr. Gil Chu, Professor of Medicine (Oncology) and of Biochemistry. It will feature approximately 20-22 hours of lecture time with seven sessions focused on clinical correlation. To make room for this new course, we will expect incoming students to have completed biochemistry either before they arrive, during the Summer or in the Fall. Fulfilling this expectation will be facilitated by a new on-line course that will include weekly tutorials.

Permitting these changes in the curriculum not only requires the enormous commitment and dedication of faculty and staff but also necessitates funding and resources. A general perspective in the past has been that the School's Operating Budget conspired against the ability to make meaningful changes in the curriculum. Accordingly, during the past year, in concert with the changes going on with curriculum development, we also engaged in a process to change the School's decades old Operating Budget. This effort was lead by Mike Hindery, Senior Associate Dean for Finance and Administration, who worked closely with faculty and staff. This too proved to be a difficult and challenging process, but I am very pleased to say that the dialogue we engaged in around the Operating Budget permitted us to develop a formula that has now been widely embraced. Central to that has been a focus on assuring that significant portions of the School's Operating Budget be focused on the education of medical and graduate students – and that this be done in a fair, transparent and principled manner. At the School of Medicine Faculty Senate on May 21st, Mike Hindery reviewed the new changes in the Operating Budget that will be implemented in the upcoming FY04 fiscal year and pointed out the manner in which it will foster and support education within the School. I have reviewed these changes in the April 14th issue of the Dean's Newsletter (<http://deansnewsletter.stanford.edu/>).

Taken together, the changes defined above represent major steps forward for Stanford Medicine and I am deeply appreciative to our entire community for helping to bring them to fruition. Truly exciting times lie ahead.

University Academic Council Update on Diversity

At the University Senate meetings on May 1st and May 15th, the issue of diversity at Stanford was discussed and debated. Professor Renato Rosaldo, Chair of the Council on Diversity offered the following introductory comments at the May 15th meeting: “I’ll say two things... One is that we believe that diversity is central to the mission of the University ... Second, we have concluded that our number-one priority should be to increase faculty diversity. There are two reasons for this approach. The first is that we believe that enhancing faculty diversity would have the greatest impact on programs that affect graduate students and undergraduates, and as well as staff in the University. The second is that we’re facing a crisis in faculty of color at Stanford. There will be a number of departures due to retirement and other reasons in the near future, so that these numbers are likely to go down unless we make a concerted effort to increase them. And even at that, we may just be standing still.”

A robust discussion followed with Senate members supporting the importance of diversity and offering opportunities for improvement at Stanford. From the perspective of the medical school, I offered the following comments during the Senate meeting: “...Stanford Medical School has actually done quite a good job for a number of years in creating a pipeline for undergraduate medical students. (Thanks to the efforts of Drs. Fernando Mendoza, Ron Garcia, Gabe Garcia and others, Stanford School of Medicine has) been very proactive, it has been very thoughtful.... Currently, the medical school is probably the national leader in underrepresented minorities. Twenty-three to 25 percent of each class are ... underrepresented minorities (excluding Asian students). During the last year we have made a concerted effort to improve diversity in our bioscience graduate students as well, trying to create a similar kind of pipeline. (However, I noted that) where we are failing is at the faculty level, for a number of reasons. I’m not sure that we’re nurturing people well enough to move them to the faculty level. So the pipeline effect that has happened within the School of Medicine for high school and undergraduate levels really needs to move people to mentor effectively at the faculty level.” (I further noted that there are underrepresented minority graduate students or post-docs who have been recruited right out from under our noses to faculty positions elsewhere before a process to keep them here had been started. This suggests “that the way we’re operating, which is to wait until the (search) process happens, may be too late... I think we need to rethink our appointments process and think more openly and creatively about how to nurture young people and let them know in a very early phase of their career development that there is an opportunity for them to stay here (at Stanford).”

Given the paucity of minority faculty within the School, we have much work to do. Thankfully, we have a leadership group committed to improve faculty as well as student

diversity in a proactive manner. The task now is to make progress in a steady and consistent manner. I view this as one of our most important mandates.

Faculty Mentoring and Annual Planning Session

A requirement of the University and School of Medicine is that faculty review and planning sessions be held annually. Such reviews are important for faculty at all levels of career development. To assure that they are done in a timely and consistent manner, the School is initiating a standard process to document the planning sessions. These can complement the procedures performed within departments but they will serve to document that the planning conference has occurred.

At the Executive Committee on Friday May 16th, Dr. David Stevenson, Senior Associate Dean for Academic Affairs, indicated the key elements that would be sought and codified. Faculty will be asked to delineate the following:

- Your goals and objectives and whether or not they were achieved
- Your need for additional help to meet your goals
- Your accomplishments
- Your characterization of your time spent in patient care (if applicable), teaching, research and administration
- Any factors outside work that are affecting your productivity
- Any other topics of importance to you

With that, the following document will be completed by the department chair or delegate and co-signed by the faculty member after the annual career planning conference has taken place.

STANFORD UNIVERSITY SCHOOL OF MEDICINE ALL DEPARTMENTS

ANNUAL CAREER PLANNING CONFERENCE

(To be completed by the Chair/Delegate after the conference. PLEASE ATTACH EXTRA PAGES, IF NECESSARY.)

- A. 1. The curriculum vitae for this faculty member was reviewed and ☐
discussed
2. A copy of his/her CV is attached to this report ☐

B. The following issues were identified by me as most important in his/her development in the next year:

C. I have provided specific counsel regarding career planning and goals for the next year as follows:

D. The following topics were discussed:

1. Allocation of time ☐
2. Academic/professional support ☐
 - Availability of mentors ☐
 - Opportunities for learning ☐
 - Resource adequacy ☐
3. Financial issues ☐
4. Professional networking ☐
5. Achieving career goals ☐
6. Personal issues ☐
7. Criteria for reappointment/promotion ☐

above:

The discussion was as outlined

Signature of Chair/Delegate Date

Signature of Faculty Member Date

Cc: Mentor, _____ and Chair

Mentoring, advising and career development planning are among the most important responsibilities we have in academic medicine. It is imperative that faculty, mentors, division chiefs and department chairs participate together in this process. I share this information with you so that all faculty can be proactive in making sure that they are participating in an annual planning evaluation.

Appointment of Robert Jackler as Chief of Otolaryngology (ORL)

I am very pleased to announce that Dr. Robert Jackler has accepted our invitation to serve as Chief of Otolaryngology at Stanford School of Medicine. Dr. Jackler is currently Professor of Otolaryngology and Neurological Surgery at UCSF. He is internationally recognized as a leader in the field of ORL and Otology. He is also the Editor-in-Chief of Otology and Neurotology and is on the editorial board of numerous other prestigious journals. Dr. Jackler is also the author of over 150 publications and is highly recognized for his surgical and academic skills. I am enormously pleased that he will be joining our Stanford community this summer.

I want to thank Dr. Tom Krummel, Chair of the Department of Surgery and the Emile Holman Professor and Susan B. Ford Surgeon-in-Chief at LPCH, for his work as Chair of the Search Committee and the Committee for its accomplishment in finding and helping to recruit Dr. Jackler to Stanford.

Good News for Stanford and Neuroscience

During recent weeks Dr. Bill Mobley, John E. Cahill Family Professor and Chair of the Department of Neurology, has been wrestling with an enormously difficult decision. Dr. Elias Zerhouni, Director of the NIH, invited Dr. Mobley to serve as Director of the National Institute of Neurological Diseases and Stroke. Clearly the opportunity to serve as the leader of an important research institute is highly prestigious and speaks volumes to how valued Bill Mobley is to the national community. Thankfully for Stanford, after careful, diligent and critical assessment, Bill has decided that he would remain at Stanford. I am thrilled with Dr. Mobley's decision as are his colleagues in basic and clinical sciences in the School of Medicine and throughout the University. Indeed, during the past few weeks I have received numerous calls and pleas from the Stanford community to "find a way to keep Bill here". As we move forward with our broader initiatives in neuroscience and, in particular, with our future Stanford Institute for Neuroscience, I am absolutely confident that Dr. Mobley's role as an investigator and leader will prove exceptional. Indeed, the future is much brighter with his decision!

Update on ACCESS

Since its founding in 1998, the ACCESS (Academic Consortium for Clinical Excellence in Scientific Studies) Clinical Trials Office has become a very important resource at Stanford. Established by Dr. Charles Prober, Professor of Pediatrics, ACCESS is now directed by Dr. Steve Alexander, Professor of Pediatrics. They have provided excellent leadership. Indeed, during the past couple of years, the ACCESS mission has grown to encompass:

- Developing relationships with industry to increase principal investigator opportunities for faculty
- Serving as a single point of contact for industry and faculty regarding clinical research at Stanford

- Creating a database of Stanford clinical faculty research interests to match industry protocols with faculty investigators
- Managing the outpatient ACCESS Clinical Trials Center, free to faculty for their industry-sponsored research
- Providing continuing clinical research education and professional development for Stanford personnel
- Conducting orientation for new clinical coordinators and other clinical researchers
- Assisting the Research Management Group flow and price industry protocols to establish realistic study budgets
- Providing limited research coordinator support services
- Developing a networked community of over 540 Stanford personnel involved in clinical research
- Maintaining a research coordinator pool (internal and external) of self-identified nurses and coordinators seeking research positions
- Circulating new research coordinator job postings to email distribution lists

I would strongly encourage you to review the resources available from ACCESS. The webpage is <http://www-med.stanford.edu/access/index.html>.

Summer Student Safety Training

I was asked to make this announcement by the Office of Health and Safety because many of our School of Medicine Departments offer summer programs that allow high school students an opportunity to experience scientific research in one of our School of Medicine laboratories. These valuable programs encourage students to explore their interest in science by providing them with hands-on research experience in one of laboratories. Accordingly, I would like to remind Departments and faculty offering these programs to ensure that all students working in School of Medicine laboratories receive appropriate safety training **prior** to working in any School laboratory.

As you are aware, all laboratory personnel are required to attend a Laboratory Safety Training Seminar to be certified to work in a School laboratory. This requirement also applies to summer students regardless of how long (or short) they will work in a School lab. The School of Medicine Health & Safety Programs Office has scheduled several seminars over the next few months in an attempt to accommodate the seasonal influx of students. If you have students who require training, please contact the School's Health & Safety Programs office at 723-0110 to inquire about specific seminar dates and times.

Annual Financial Aid Dinner

On Tuesday, May 13th the Annual Student Financial Aid Dinner was held to recognize and thank the wonderful members of our community, locally and nationally, who have contributed to the endowment to support student education. As you likely know, the cost

of medical education is enormous – with an average indebtedness of over \$125,000 in medical schools across the country. Because of the extraordinary contributions of donors, Stanford students incur among the lowest amount of indebtedness of any school in the nation. This has enabled students who could never have afforded to attend medical school to do so as well as to permit students to explore research projects and issues that would otherwise be impossible to achieve. We all owe a great vote of appreciation to these benefactors.

This annual event is also made special by bringing together donors with the students they are supporting. This “reunion” creates a sense of community that transcends financial support per se and that engages a true bonding and personalization – for both our students and our financial aid contributors.

I also want to thank the three medical students (Eric Cornidez SMS 1, Michelle Rhee SMS 4 and Noah Epstein SMS 2) who spoke at the dinner and reflected how the support they have received is helping them to pursue their dreams in medicine and science.

Jess Shenson and Robert Chase Lecturer

From May 21-23rd, Dr. Dan Federman, Professor of Medicine at Harvard and former Dean for Medical Education, served as the Jess Shenson as well as Robert Chase Lecturer. For Dr. Federman, it was an opportunity to have a homecoming and for Stanford it was a chance to benefit from his insights on medical education and academic medicine. Equally important, it was an opportunity to recognize two major figures in Stanford Medicine – Jess Shenson and Robert Chase. Dr. Shenson was a long-term supporter of Stanford Medical School as well as the arts and music communities of San Francisco and the greater Bay Area. The Shenson lectureship is coordinated by the Department of Medicine and recognizes individuals who are outstanding clinicians and teachers. Certainly Dr. Dan Federman fits that bill.

This year also marked the inaugural Robert Chase Lecture in honor of Dr. Chase, who has spent four decades as a surgeon, scholar, investigator and teacher at Stanford. Making the event particularly special is that Drs. Federman and Chase served respectively as Chairs of Medicine and Surgery at Stanford during the early 1970’s.

Also meaningful to our Stanford community is that Dr. Federman’s lecture on medical education outlined many of the challenges and problems that we are now working to address in our New Stanford Curriculum (see above). Such an affirmation, from one of this nation’s leading medical educators, is reassuring and empowering.

Honors and Awards

- **Dr. Dennis Baylor**, Professor of Neurobiology, Emeritus has been inducted as a Foreign Member into the Royal Society of Sweden – an honor bestowed each year on only a very few scientists around the world. Congratulations to Professor Baylor.

- **Dr. Helen M. Blau** received an honorary doctorate ("honoris causa") from the University of Nijmegen in the Netherlands on May 15th, 2003. Congratulations to Professor Blau.
- **Dr. Lucy Shapiro** has been elected to the American Philosophical Society. The APS is the country's oldest learned society having been founded by Benjamin Franklin and friends over 250 years ago. Today it is a renowned international organization that promotes excellence and useful knowledge in the sciences and humanities through scholarly research, professional meetings, publications, library resources, and public exhibits. Election to membership honors distinguished achievement and contributions. Congratulations Dr. Shapiro.
- **Stanford Entrepreneurial Challenge.** The winners of this year's E challenge, Team "VisiVas," won \$25,000 cash award as well recognition for a nascent biotech innovation aimed at assisting the minimally-invasive treatment of cardiac chronic total occlusions in a way that is better for the patient than existing therapies. The team was comprised of a multidisciplinary team spanning Schools of Medicine, Business, Engineering, and Product Design; the team embodies the spirit of the Bio-X initiative and illustrates Stanford's unique strength in capitalizing on interdepartmental collaboration for culturing clinically beneficial, translational medical innovation. The team owes its roots to the BioMedical Innovation Program led by Paul Yock and others.

Appointments and Promotions

- **Tirin Moore** has been appointed Assistant Professor of Neurobiology, effective 6/1/2003 to 5/31/2006.
- **Victor Tse** was reappointed to Assistant Professor of Neurosurgery at the Santa Clara Valley Medical Center, effective 5/1/2003 to 9/30/2006.

Dean's Newsletter

June 9, 2003

Commencement 2003

Next weekend (June 14-15) is Commencement at Stanford. The official University Commencement will be on Sunday morning at 9:00 a.m. in Stanford Stadium. We will hold our School of Medicine ceremony on Saturday, June 14th beginning at 2:00 p.m. on the Dean's Lawn (next to the Clark Center). You are welcome to attend (and if you are faculty, to march) in this celebratory event. This year's School of Medicine Commencement speaker will be Dr. Julie Gerberding, Director of the CDC. Given all of the recent global infectious disease challenges (anthrax, smallpox, SARS to name a few),

I am confident that this will be a timely and meaningful commencement address. Even more importantly, it will be an opportunity to honor and recognize our medical and graduate students who have worked so hard to achieve this special day. Please join us and our students and families on June 14th and 15th.

Louis and Dorothy Kovitz Lectureship will Address Challenges in Global Infectious Diseases

On Wednesday, June 11th Professor Keith PWJ McAdam, Welcome Professor of Hygiene and Tropical Medicine at the London School of Hygiene and Tropical Medicine, will deliver the 29th Louis and Dorothy Kovitz Lectureship on the “*Challenges in Global Infectious Diseases: Creative Opportunities*.” The lecture, which is sponsored by the Department of Medicine and the Division of Infectious Diseases and Geographic Medicine, will take place in the Fairchild Auditorium at 5:00 p.m. A reception will follow.

For the past eight years Professor McAdams has been the Director of the Medical Research Council (UK) Unit in the Gambia. The Unit has had a distinguished history since its inception in 1947, and now has three field stations employing 800 staff. While at the MRC Unit in the Gambia, Dr. McAdam’s research has centered on infectious complications, focusing on the pathogenesis and management of tuberculosis, malaria and HIV as major health problems in Africa. Under his direction, the MRC Unit has defined the epidemiology of the major endemic infectious diseases and studied the immune responses and genetic susceptibility of those exposed. A major goal has been to develop and test vaccines and other appropriate public health interventions in the sub-Saharan setting.

Update on Graduate Admissions 2003

As we prepare to graduate students receiving M.S., M.D. and Ph.D. degrees next weekend, we are also just completing the selection of the students who will enter our graduate programs this September. Dr. Ellen Porzig, Associate Dean for Graduate Education, has compiled a report on this year’s graduate student admissions process, aspects of which I would like to share with you.

This year’s entering class includes 100 students who will begin this Fall along with nine students who will begin their studies in the Autumn 2004. Several students, who have won international fellowships, will enter in the Autumn 2005. A record number of 2,407 applications to the 12 Biosciences Home Programs were received this year, a 22% increase in the number of applicants compared with last year. These outstanding graduate students were accepted from approximately 70 colleges and universities. In addition to Stanford, the colleges and universities with the greatest number of students starting this Fall come from Harvard, UC Berkeley, MIT, Princeton and UCLA.

This year a total of 291 applicants were interviewed and almost all candidates met with 6-7 Biosciences faculty members for individual interviews. As in past years, students

accepted to the Stanford Biosciences program also receive competitive offers from Harvard, UCSF, UC Berkeley, Caltech and MIT. Our overall yield rate is around 50% (similar to past years) with students choosing Harvard, UCSF or UC Berkeley as alternatives over Stanford. Thanks to the exemplary leadership of Ms. Kimberly Griffin (our new Director of Diversity in Biosciences Programs), the entering class includes 12 excellent students who are members of under-represented minority groups.

Thanks to the work of our CGAP co-directors, Dr. Karla Kirkegard, Professor of Microbiology and Immunology, and Tim Stearns, Associate Professor of Biological Sciences and Genetics, along with the dedicated efforts of Ellen Porzig, Suzanne Frasca, our new Director of Admissions and Administration, and Eleanor Antonakos, the process of interviewing and selecting outstanding applicants went extremely smoothly this year. In addition, several new events were featured this year including:

- A new format for interview weekend that included interviews preceding the weekend events.
- Posters sessions that were more robust than previous years, facilitating small group discussions.
- Importantly, all 12 Home Programs participated in the Thursday evening dinner at the Sheraton and featured outstanding presentations by Dr. Julie Theriot (Biochemistry and Microbiology and Immunology), Marc Tessier-Lavigne (Biological Sciences and Neurosciences), Matthew Scott (Developmental Biology, Genetics, Neurosciences, Cancer Biology and Clark Center), and Roger Kornberg (Structural Biology).
- The stipend increase (of \$1,000) to match the Stanford Graduate Fellowship level was announced in a timely manner by former Senior Associate Dean W. James Nelson.
- Also, for the first time, selected Biosciences graduate programs participated in Graduate Diversity Admit Weekend events at the University, including the dinner with the President and Provost. Notably, 100% of the Biosciences students who attended the GDAW accepted our offer of admission.

We are very proud of the results of this year's graduate student admissions process and look forward to welcoming our new class in September.

Cancer/Stem Cell Institute Briefings

During the past several weeks, we have been holding evening dinner discussions to brief community leaders about our new Stanford Institute for Cancer/Stem Cell Biology and Medicine. With the support of our Office of Medical Development, we have invited 10-12 families to visit with us for each session so that they might learn about the progress we are making. The sessions have included opening presentations by me and Martha Marsh, CEO of Stanford Hospital and Clinics, to highlight the role that Stanford has played in cancer research and treatment in the past and how the new Institute for Cancer/Stem Cell Biology and Medicine will further enhance progress in bringing innovations from the bench to the bedside in the future. This will also be advanced by the opening of the new

Cancer Pavilion early next year which will provide state-of-the-art facilities for ambulatory care, as well as a setting in which translational research can take place.

The major feature of our sessions has been presentations by Dr Karl Blume, Professor of Medicine and Associate Director of the Institute, and Dr. Irv Weissman, Karel and Avice Beekhuis Professor of Cancer Biology and Director of the Cancer/Stem Cell Institute. In addition to laying out the range of research discoveries that have occurred - and those that will be possible in the future - the heart of these events has been the opportunity to engage in an informal discussion with community leaders to address their questions, concerns and areas of interest. We have also benefited from the participation of various faculty who have attended these sessions, including Drs. Judy Shizuru, Brandy Sikic, Griff Harsh, Stephanie Jeffries, Bob Negrin, Brooke Jeffrey, Nelson Teng and others.

Our goals have been threefold: to help educate community leaders about the research, clinical care and education that are taking place at Stanford, focusing on the progress in cancer and stem cell biology; to help our community leaders become advocates for Stanford's clinical and research programs - especially given the challenges being faced by academic medical centers today; and to help us to define ways to support our missions in research, clinical care and education.

These venues have been well received and we plan to continue them through the year as a means of enhancing our interactions and engagement with our community and faculty leaders.

Symposium on Learning and Technology

On Thursday, May 29th, a special Symposium on Learning and Technology was held in the Wallenberg Hall and focused on the opportunities for medical and bioscience education emerging through innovations in information technology, simulation and virtual reality. Thanks to the efforts of Dr. Parvati Dev, Associate Dean, Learning Technologies and Director, SUMMIT Lab, and Maggie Saunders, Program Planner for Stanford Medicine Information and Learning Environment (SMILE), who organized this symposium, we were treated to the reflections and recommendations of a diverse group of faculty, as well as leaders in technology and innovation. The governing theme was that during the next 10-20 years our students will change dramatically and will come to medical and graduate school with an entirely different array of skills and expectations compared with those of the past. Importantly, their facility and use of information knowledge resources will be quite sophisticated and our modes of teaching and education will also need to have evolved significantly. Accordingly, SMILE is being developed to achieve these goals and, we believe, will set Stanford apart from other medical and graduate schools in exciting and important ways. Some of the details of this Symposium are covered in a recent report in the June 4th Stanford Report (<http://news-service.stanford.edu/news/2003/june4/symposium.html>).

Hospital Update: Professional Revenue Cycle

Dr. Al Lane, Chair of Dermatology and Chair of the Professional Billing Committee, and Ms. Margaret Boggs, Director of Professional Services Operations, asked me let you know that Stanford Hospital and Clinics (SHC) has engaged Stockamp & Associates (Stockamp) to assist SHC with improving performance within the professional revenue cycle. The project has been dubbed the Revenue Enhancement and Accountability Project (REAP).

You may be aware that Stockamp completed hospital revenue cycle projects at SHC (1999-2000) and LCPH (2000-2001), which were very successful for both organizations from a financial and patient service perspective. Stockamp has also worked with many of the nation's major health care providers to improve financial performance, increase operational efficiency, improve customer service and create competitive advantage.

Achieving full reimbursement for the professional services that we provide requires a sophisticated understanding of health plan and government requirements, as well as operational excellence in all of the components of the revenue cycle. As such, the approach during REAP will include extensive interviews with management and staff, detailed work flow and data analysis, significant work flow design, and implementation of process improvements and supporting tools. The overall goal of this project is to achieve improved levels of professional revenue cycle accountability, common goals, expectations and cooperation between SHC operational departments and the clinical departments within the School of Medicine. Dr. Lane and Ms. Boggs ask that you help support this important professional revenue cycle initiative.

Update from the School of Medicine Executive Committee

At the Executive Committee on Friday June 6th, I gave an update on our master facilities planning and some recent developments regarding faculty billets. As you may recall, I have detailed in prior Newsletters, the work that we have been doing to secure a long-range facilities plan for the School of Medicine - as well as its relationship to the Facilities Plan for the Medical Center as a whole. I focused my recent remarks on the School, which follow the plans outlined at the Retreat held in January, 2003 (detailed in the February 3rd Dean's Newsletter: <http://deansnewsletter.stanford.edu>)

Our goals have been largely focused on both new facilities as well the reuse or ultimate demolition of existing ones. We anticipate that as part of the Science, Engineering and Medicine (SEM) Campus development, we will have two new buildings over the next 5-10 years. These will include the SMILE (Stanford Medicine Information and Learning Environment) project and the Stanford Institutes of Medicine #1. These will be developed in conjunction with new or replacement facilities for the Schools of Engineering, Earth Science and H&S. Planning for these facilities has been coordinated with University leadership and was a major topic for the Retreat of the Executive Cabinet that was held on June 2nd. While there is commitment to proceed with the continued conceptual planning of the SEM Campus, two factors will play a major role in the time line and ultimate delineation of the size and scope of the buildings. First are the land use issues that are governed by the GUP (General Use Permit) that relates to academic

building development on Stanford property within Santa Clara County. The second relates to available funding sources, especially from philanthropy - an issue that is certainly impacted negatively by the current downturn in the economy. Accordingly, each of the projects will undergo downsizing in order to accommodate the current realities of space and funding availability. These will be managed by University Leadership and further assessed by an ad hoc committee of the Board of Trustees.

Our goal, of course, is to assure the development of state-of-the-art facilities for the education of medical and graduate students as well as for residents, postdoctoral scholars, and faculty. Included in SMILE is the development of a Knowledge Center that will serve as the library of the future. In order to accomplish these and other goals we will clearly need to make some priority judgments about which components of our educational programs will be housed in the new SMILE facility or adjoining space in the current Stone complex.

In addition to new facilities for education, our plans for research space focus on developing modern facilities to house our Stanford Institutes of Medicine while also moving wet laboratories from the Stone complex and converting this now nearly 50 year old space for use as dry laboratory or administrative space. This requires considerable planning and sequencing - and while we have already done a significant amount of such modeling, it is likely that changes will occur as the overall size and dimensions of SIM #1 become better defined.

Obviously I will keep you informed on the progress we are making in these important facilities planning developments. At the same time, we have also been participating with the Hospital leadership in determining both on-site and off-site facilities assessments for Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH). The first phase of these plans address renovations within the current footprints of both hospitals in order to meet current and future patient care needs. These discussions will also continue to unfold over the next months.

In addition to providing an update on space and facilities planning, I also informed the Executive Committee about the impact of the cap on faculty billets that we have now received from the Provost. This cap will apply to all billets - including UTL, MCL and non-tenured positions, and thus will require careful governing and management in order to assure that we can achieve our missions in education, research and clinical care. We are currently assessing the immediate impact of this cap by assessing current billets and expected vacancies along with searches that are in progress or commitments that have already been made to various departments or programs. As we have discussed in various forums, we recognize the value of being a small school of medicine that emphasizes quality of its faculty and students. At the same time, managing the complex demands that relate to missions in patient care, as well as education and research, will certainly present challenges that will require rigorous monitoring and priority setting now and in the future.

Honors and Awards

- **Dr. Bryan D. Myers**, the Stanford Professor of Nephrology and Chief of Division of Nephrology, has been named the fifteenth recipient of the Albion Walter Hewlett Award. The Hewlett Award was established by the School of Medicine in 1983 to honor “the physician of care and skill who is committed to discovering and using biologic knowledge, wisdom and compassion to return patients to productive lives.” The award commemorates Dr. Albion Walter Hewlett, professor of medicine at Stanford from 1916 to 1925. All faculty in the School of Medicine are eligible to be selected; the previous winners have come from a number of departments throughout the school.

As winner of the award, Dr. Myers will speak on “*Elucidating the Pathophysiology of Acute Renal Failure: a Stanford Experience*” during Department of Medicine Grand Rounds on Thursday, June 12, at 8:00 a.m. in Fairchild Auditorium.

- **Dr. Robert Glaser**, former Dean and Professor of Medicine at Stanford University, has been awarded the prestigious Harvard Medal in recognition of his extraordinary service to Harvard University. He is a John Harvard Fellow and a member of the class of 1940 of Harvard University. As a Professor of Medicine at Harvard Medical School, he received the Harvard Medical School Dean’s Medal. Congratulations, Dr. Glaser.
- **The Office of Communications and Public Affairs** has won three top awards for their work, including
 - o A gold medal in the Research, Medicine and Science News Writing category for news releases written by staff writers Amy Adams and Sara Selis. The releases were judged on the basis of their quality and effectiveness.
 - o A gold medal for a cover design illustration for Stanford Medicine magazine. The cover appeared on the summer 2002 issue and illustrated the story on living liver donors. Special accolades go to Rosanne Spector, the managing editor of Stanford Medicine. The magazine was designed by David Armario.
 - o A bronze medal for visual design for Stanford Medicine magazine.

In addition, Jeffrey Fisher, one of the illustrators for Stanford Medicine, won an award from the Society of Publication Designers for an illustration that appeared in the Fall 2002 issue of the magazine.

- **Dr. Anne Villeneuve**, Associate Professor of Developmental Biology and Genetics, and Dr. Peter Jackson, Associate Professor of Pathology and of Microbiology and Immunology, are two of the three winners of Kirsh Foundation Investigator Awards. Congratulations to both Drs. Villeneuve and Jackson for being selected for this prestigious award.

- **Adia George**, SMS 1, has won a National Medical Foundation Award, a competitive award of which only 35 are given in the nation. Congratulations to Adia and her mentor, Dr. Phyllis Dennery, Associate Professor of Pediatrics.
- **Dr. Erika Schillinger**, Clinical Assistant Professor with Family Medicine, has been named one of the “Nation’s Best Doctors” by the Ladies Home Journal.

Appointments and Promotions

It gives me great pleasure to announce the following Endowed Professorships:

- **Dr. Michael P. Link** will be the Lydia J. Lee Professor in Pediatric Cancer.
- **Dr. Michael T. Longaker** will be the Deane P. and Louise Mitchell Professor in the School of Medicine.
- **Dr. Samuel K.S. So** will be the Lui Hac Minh Professor.

Other appointments and promotions:

- **Rosemary Butts** has been promoted to Associate Professor (Research) of Radiology, effective 6/1/2003 to 5/31/2009.
- **Claudia Buchmann** has been appointed to Associate Professor of Education, effective 1/1/2004 to 12/31/2007.
- **Booil Jo** has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences, effective 9/1/2003 to 8/31/2006.
- **Natasha Kirkham** has been appointed to Assistant Professor (Subject to Ph.D.) of Psychology, effective 8/1/2003 to 7/31/2007.

Dean’s Newsletter June 16, 2003

Special Commencement Issue

During the summer months the Dean’s Newsletter will depart from its every other week schedule to a more irregular reporting schedule. Regular biweekly issues will resume after Labor Day.

Special Newsletter on Commencement

On Saturday, June 14th, the School of Medicine held its celebration and diploma awarding event on the Dean’s Lawn. The University Commencement Ceremony, was held on Sunday morning, June 15th. This year, the School presented 29 Master of Science degrees, 91 Doctor of Philosophy degrees and 74 Doctor of Medicine degrees. Among these, students received combined degrees, including eleven MD/PhD degrees, two MD/Master degrees, one PhD/Masters, and one BA/MS.

Please join me in extending our personal congratulations to each and every graduate and to their parents, families and friends. What a wonderful accomplishment by all.

I would also like to take this opportunity to especially thank Char Hamada, Zera Murphy and Suzanne Bethard and others in Student Affairs for all of their painstaking efforts that made this year's commencement a tremendous success. Also thanks to Sharon Olsen, Lorena Najarro, Velessa Peairs, Cassandra Sooter, Ann Davis, Kathryn Fitzgerald, Eon Rios, and Justin Odegaard for helping to set up Saturday's great event. (Eon and Justin are current medical students who volunteered their time on Saturday to carry the flags). Working behind the scenes on Friday to help make the day a success was Eva Vasquez, Robin Casey, Juhn Verano, and Patricia Perez.

Faculty Awards

In addition to congratulating our students for their accomplishments, commencement is also a time to honor faculty who have made significant contributions to their education. Accordingly, I am pleased to list the teaching awards that were announced at the School of Medicine Commencement.

The Arthur L. Bloomfield Award: In Recognition of Excellence in the Teaching of Clinical Medicine

Neil Gesundheit, Associate Professor of Medicine (Endocrinology, Gerontology & Metabolism) and Associate Dean for Medical Education

John Giacomini, Professor of Medicine (Cardiovascular Medicine)

Sherry Wren, Associate Professor of Surgery (General Surgery)

The Henry J. Kaiser Family Foundation Award: For Outstanding and Innovative Contributions to Medical Education

Brian Hoffman, Professor of Medicine (Endocrinology, Gerontology and Metabolism)

The Henry J. Kaiser Family Foundation Award: For Excellence in Preclinical Teaching

Ben Barres, Professor of Neurobiology and of Developmental Biology and of Neurology and Neurological Sciences

Gilbert Chu, Professor of Medicine (Oncology) and of Biochemistry

Steven Guest, Adjunct Professor Medicine, Santa Clara Valley Medical Center

Julie Theriot, Assistant Professor of Biochemistry and of Microbiology and Immunology

The Henry J. Kaiser Family Foundation Award: For Excellence in Clinical Teaching

Myriam Curet, Associate Professor of Surgery (General Surgery)

Neil Gesundheit, Associate Professor of Medicine (Endocrinology, Gerontology & Metabolism) and Associate Dean for Medical Education

Jose Maldonado, Assistant Professor of Psychiatry and Behavioral Sciences

The Franklin G. Ebaugh, Jr. Award: For Advising Medical Students

Oscar Salvatierra, Professor of Surgery (Transplantation) and of Pediatrics (Nephrology)

The Compassion in Medicine Award

Samuel LeBaron, Associate Professor of Medicine (Family and Community Medicine)

The Alwin C. Rambar-James B.D. Mark Award: For Excellence in Patient Care

Stanley Schrier, Professor of Medicine (Hematology), Emeritus
Stanford University School of Medicine Award for Graduate Teaching

Julie Theriot, Assistant Professor of Biochemistry and of Microbiology and Immunology

Stanford University School of Medicine Award for Outstanding Service to Graduate Students

William Newsome, Professor of Neurobiology

Congratulations to all.

Address to the Graduates

One of the traditions of the School of Medicine Commencement is a presentation by an elected member of the Graduate and Medical Student graduating class. This year, Eleanor Suchada Click or the 2003 Graduation class in Genetics (Ellie is also receiving her M.D.

today), and Feyza Essam Marouf of the 2003 graduating class in Medicine, spoke to the graduates and guests. They each gave compelling and inspiring remarks.

2003 Commencement Speaker

**Julie Louise Gerberding, M.D., M.P.H.
Director, Centers for Disease Control and Prevention**

We were also privileged this year to have Dr. Julie Gerberding as our 2003 Commencement Speaker. Dr. Gerberding addressed the importance of a national health system that embraces a health care system and the biomedical research enterprise that underlies it for the diagnosis and treatment of disease among individuals and a public health system for promoting health and preventing disease and injury in communities.

She noted that while both of these systems have made extraordinary achievements in the past decades, there are still walls between them in far too many locales. For example, schools of Public Health on one side of the street that do not interface with schools of medicine on the other; clinicians in practice who have no clue about the local health department's role in disease prevention; scientists at the bench with new knowledge to apply but no conduit for delivery; local health officials who collect data but provide no information or knowledge of use to doctors in practice.

Accordingly, the dichotomy between the public health and the health care systems is artificial, ineffective, and absolutely obsolete. Therefore, it is time to integrate these two systems – to create a new state-of-the-art network – a *health system* - that takes full advantage of the extraordinary opportunities 21st Century science and technology afford us.

Dr. Gerberding envisions this new *health system* as a highly connected *network* in the truest sense of the word. A *network* of people, scientists, clinicians, facilities, organizations, institutions, and communities and nations with the shared primary goal of ensuring that each of us enjoys the best possible quality and quantity of life.

Specifically, she noted how the recent experience with SARS has taught us the value of a comprehensive global health network to address threats to our health - whether they are intentional terrorist threats, emerging infections such as SARS, WNV, monkeypox, or the epidemic threats of tobacco and obesity. We live in a global world but it is a small world.

Protecting the health and safety of people in this small world requires that our *health system* be highly cross-linked. But certain links that involve you as physicians and scientists must be especially strong if we are to be successful:

The first strong link: Physician or scientist to local health officials – a conduit to the community. This might include, for example, the astute clinician who recognizes a new illness or syndrome and engages local health officials.

Second Strong link: Physician or scientist and real-time learning resources, for example, just in time information; handheld data; computer searches – at the bedside just in time to make the right decision or “Just in Case” information that permits advanced appropriate preparation.

Notably, Dr. Gerberding indicated that one of the strongest links of all is the stethoscope, since it is one of our last remaining personal tools – the link in the health system network that connects us to our patients. Indeed, using the stethoscope means that the physician and patient have to be present together, there is a laying on of hands, and most importantly, the physician has to listen, not just to the patient’s heart sounds, but to the patient’s heart.

As concluded by Dr. Gerberding: “Science and technology have evolved enormously – we can do more to diagnose disease, save lives and mitigate suffering than we ever dreamed possible, but what the patient actually wants and needs have changed far less. **The truth is, most patients are far more concerned about caring than they are about curing.**

In too many corners of our health system, there is no care. The ability to care, not just for, but about patients is a quality that characterizes the best physicians. Sadly, empathy is so hard to maintain in this white coat world of science and technology.

For those of you who will be new interns and residents, your empathy for patients will be increasingly challenged. Your stethoscope is the umbilical cord that tethers you to your patients, the extension of your ears and your conduit to the patient’s heart.

You are the leaders of the 21st Century health system. As you occupy your place in the network of health, as physician, scientist, or both, you **link** your knowledge, your skill, your empathy and your responsibility with those of countless other dedicated professionals around the globe. I urge you to make strong links and engage your colleagues in public health, research, and the clinical frontlines. As the newest credentialed members of our nation’s health system, I thank you - for I know our future is in excellent hands”.

Graduates listed below are our 2003 graduates for the School of Medicine.

Dean's Newsletter

June 30, 2003

More about the New Stanford Curriculum

At the Medical School Faculty Senate on Wednesday June 18th, an update on the status of New Stanford Curriculum was provided. I must say at the outset that remarkable progress has been made in a relatively short time to bring the changes in curriculum to the point where they will be implemented this Fall with the new entering class. This was very much the result of close cooperation between the Senate and its Committee on Courses/Curriculum (chaired by Ted Sectish) and the Dean's office (especially Neil Gesundheit, and Julie Parsonnet). It also reflects the tremendous work and cooperation of Course Directors, many of whom made considerable sacrifices to help assure that the New Curriculum will be as successful as possible for the next generation of Stanford Medical Students. Special thanks must also go to Dr. Oscar Salvatierra who, as Chair of the Senate, played an instrumental role in coordinating the goals and agendas of a multiplicity of interest groups but who never lost sight of the importance of putting our students, current and future, first and foremost in his agenda.

Although considerable work remains, the current plan shows that entering students will begin this Fall on September 2nd (rather than September 24th when the rest of the University begins its Autumn Quarter). This will permit greater flexibility and thus permit the schedule to accommodate both new courses as well as opportunities for initiating the Scholarly Concentrations.

Students will begin with a new course entitled Molecular Foundations of Medicine that is being organized by Dr. Gil Chu, Professor of Medicine and of Biochemistry. This will be taught on Monday, Tuesday, Thursday and Friday mornings. Anatomy, as well as Cells and Tissues, will be taught on Tuesday and Thursday afternoons. On Monday and Friday afternoons, Clinical Science Correlates will be taught. This schedule will permit Wednesdays to be free for students to take electives, study or begin to plan for their Scholarly Concentrations. Overall, course work will be on Monday/Tuesday and Thursday/Friday and will, therefore, permit students to have time for individual pursuits on Wednesdays and over the weekend. In the Winter Quarter, Introduction to Pathological Processes will begin along with Neurobiology, the conclusion of Anatomy and the continuation of Clinical Correlates. By the Spring Quarter, students will have Tuesday and Thursday afternoons as well as Wednesdays free for Scholarly Concentrations, electives and study time. The organ-based didactic schedule will require considerable coordination among course directors but should further optimize the learning experience for students. Taken together, these changes will permit parallel learning of both basic and clinical science during the first year as well as a reduction in classroom time to permit greater opportunity for independent study.

Dr. Parsonnet, Senior Associate Dean for Medical Education, also updated the Senate on the status of the Scholarly Concentrations. She noted that all students will be required to have a scholarly concentration or "major" and that it will take one of two forms: the

Scholars Track (which can be done in four years) and the Original Research Track, which will require five or more years. To date, based on the recent RFA, eight scholarly concentrations have been selected and will be available for entering students. These are Bioengineering, Bioethics and Medical Humanities, Biomedical Informatics, Health Services and Policy Research, Immunology, Molecular and Genetic Medicine, Public Service and Community Medicine, and Women's Health. In addition to these Scholarly Concentrations, four others are in development that also closely align to student interests and include: Clinical Research, Infectious Diseases, International Health and Neuroscience. Finally, some students will also have the opportunity to devise an individual scholarly concentration if one does not exist that meets their own personal goals and direction.

Although further refinements are in progress, the overall organization of the Scholarly Concentrations is evolving nicely. There are some common themes already apparent and others will surely emerge as Scholarly Concentration Directors compare the approaches being taken in their respective programs. The preliminary schedule looks like this:

Scholarly Concentrations 2003-3004

1. Bioengineering

- **Mission:** To provide a world-class experience for medical students who wish to become more familiar with the world of bioengineering
- **Faculty Co-Directors:** Jeffrey Feinstein and Charles Taylor
- **Faculty Mentors:** Currently eight but will expand with development of the new Department of Bioengineering
- **Requirements for the Scholars Track**
 - i. Required courses (10-12 units)
 1. One Technology in Society Course (4-5 units)
 2. One Engineering Fundamentals Course (3 units)
 3. One Engineering Depth course (3 units)
 - ii. One elective course (3 units) in one of four sub-areas (Biodesign, Cardiovascular, Tissue Engineering, Musculoskeletal)
 - iii. Investigative work
 - iv. Seminar series/journal club
- **Expected size:** 12 per year (2 original research and 10 scholars) for next year but rising to approximately 25 per year by 2006.

2. Bioethics and Medical Humanities

- **Mission:** To teach students to examine the ethical and humanistic dimensions of research and practice.
- **Faculty Director:** David Magnus
- **Faculty Mentors:** 28 from 15 departments
- **Requirements for Scholars Track**
 - i. Required courses (5 units)
 1. Responsible Conduct of Research (1 unit)
 2. The Human Condition (2 units)
 3. Inquiry Methods (2 units)

- ii. Elective courses (6 units) in one of five sub-areas (Biomedical Ethics, History, Literary/Visual/Performing Arts, Social and Cultural Medicine)
- iii. Minimum of 80 hours of investigative work
- iv. Biannual symposia, grand rounds
- **Expected size:** 10 per year (2 original research, 8 scholars)

3. Biomedical Informatics

- **Mission:** To use information technology to manage, analyze and understand biomedical data, and to develop new approaches for using information to improve health.
- **Faculty Director:** Russ Altman
- **Faculty Mentors:** 24 from 12 departments
- **Requirements for Scholars Track**
 - i. Required courses (6 units)
 - 1. Colloquium and Seminar Series (2 units)
 - 2. Introductory Informatics (1 unit, on-line)
 - 3. Fundamental Methods (3 units, on-line)
 - ii. Two elective courses (6-7 units)
 - iii. Minimum of 80 hours of investigative work
 - iv. Seminar series
- **Original Research Track** will have math and computer science prerequisites
- **Expected size:** 15 per year (5 original research and 10 scholars)

4. Health Services and Policy Research

- **Mission:** To foster interest in the interdisciplinary research that guides clinical practice and health policy
- **Faculty Director:** Laurence Baker
- **Faculty Mentors:** 31 faculty
- **Requirements for Scholars Track**
 - i. One of two required introductory courses (2 units)
 - 1. Introductory Health Services and Policy Research Methods
 - 2. Survey course on Policy and Epidemiology (being developed).
 - ii. Two of four courses (8 units)
 - 1. Cost-benefit analysis
 - 2. Political economy of health care
 - 3. Health economics
 - 4. Data management and statistical programming
 - iii. Minimum of 80 hours of investigative work
 - iv. Seminar series
- **Expected size:** 13 per year (3 original research and 10 scholars)

5. Immunology

- **Mission:** To provide students with an opportunity to delve into immunology from a cellular and molecular level to translational areas such as allergy, autoimmunity, transplantation, etc.
- **Faculty Director:** Larry Steinman
- **Faculty Mentors:** 44 faculty from 13 departments
- **Requires for Scholars Track:**
 - i. Responsible Conduct of Research (1 unit)
 - ii. Two graduate courses in immunology (6 units)
 - iii. Investigative work
 - iv. Seminar series
 - v. Attendance at Immunology Retreat
- **Expected size:** 15-20 students (2 original research and 13-18 scholars)

6. Molecular and Genetic Medicine

- **Mission:** To provide medical students with research experience in the basic sciences that are the underpinnings of medicine.
- **Faculty Director:** Jim Spudich
- **Faculty Mentors:** Approximately 200 from a breadth of departments
- **Requirements**
 - i. Required courses (10-11 units)
 1. Two required graduate level science courses (8-9 units)
 2. Critical reading course (2 units)
 - ii. Investigative work
 - iii. Seminar series/departmental or IDP retreat
- **Expected size:** 20 per year (all original research)

7. Public Service and Community Medicine

- **Mission:** To gain broad understanding of the context and practice of health care in diverse communities, especially those who are underserved.
- **Faculty Director:** Tim Stanton
- **Faculty Mentors:** 42 from 15 departments
- **Requirements for Scholars Track**
 - i. Required courses (6 units)
 1. Issues in Public Service Medicine (1 unit)
 2. Medicine and Community Service Learning (2 units)
 3. Community Partnerships and Clinical Assessment and Research (2 units)
 4. Cultural Competence Workshop (1 unit)
 - ii. Two elective courses in one of seven sub-areas
 - iii. Investigative work
 - iv. Seminar series/symposia/retreat
- **Expected size:** 23 per year (8 original research and 15 scholars)

8. Women's Health

- **Mission:** To train students in basic, translational, and clinical research in women's health and comparative biology and medicine.
- **Faculty Director:** Linda Giudice
- **Faculty Mentors:** Approximately 50 from numerous departments
- **Requirements for Scholars Track**
 - i. Required courses (6-8 units)
 1. In basic research path, two basic science courses
 2. In the clinical research path, two courses in patient-oriented research
 - ii. Two elective courses (2-10 units, including clerkship electives) in one of seven focus areas of women's health
 - iii. PRECEPT
 - iv. Investigative work
 - v. Journal clubs/grand rounds/seminars
- 9. **Expected size:** 10 per year (2 original research and 8 scholars)

Welcoming Students to the Stanford Summer Research Program

On June 22nd, we were pleased to welcome 22 students who were selected to participate in the Stanford Summer Research Program in Biomedical Sciences (SSRP). This talented group of students is diverse in terms of their ethnic backgrounds, geographic origins, life experiences, and undergraduate institutions. They range from freshmen to seniors in college, and attend institutions such as Clavin University, Harvard, Yale, UC Santa Cruz, University of Maryland Baltimore County, and Florida A&M University.

The SSRP is designed provide students from diverse backgrounds who have interests in pursuing graduate work in the sciences with the opportunity to work on their own research project in a Stanford laboratory for eight weeks. They will present their findings at a research symposium on August 14th in Munzer Auditorium. Additionally, they will have the opportunity to get to know the Bay Area better through a number of field trips to locations such as Santa Cruz, San Francisco, and Monterey. Please contact Kimberly Griffin at kgriffin@stanford.edu for more information.

Update from the Council of Clinical Chairs

On Friday June 27th, the Council of Clinical Chairs reviewed the recent consumer rating of California hospitals that was published in the news media this past week. As you likely know, Stanford was rated as "average" compared to several community hospitals that received higher satisfaction scores. While there is general agreement that the leadership at Stanford Hospital & Clinics (SHC) as well as the faculty and staff wish to do better in future surveys (and will work hard to do so) it is important to recognize that there are significant differences in the kinds of patients who are served by community hospitals and the level of amenities they can offer as non-teaching facilities. Accordingly, it is not a directly appropriate comparison per se. However, such surveys are likely to become more rather than less frequent and will also be accompanied by those measuring patient outcome data. In both instances, the higher case acuity at teaching hospitals will most

likely impact outcomes more negatively. However, there is a commitment to work diligently to achieve the highest scores possible – in both patient outcomes as well as in patient satisfaction. This will require dedicated commitment by both the hospital and the School – and there was clear evidence of support for this at the COCC meeting.

In addition, Mr. Roy Santarella discussed the very significant progress that has been made in achieving bond offerings for Stanford Hospital & Clinics. These funds will be essential to improving capital and infrastructure facilities at SHC. However, to meet the expectations of rating and insurance agencies, very clear benchmarks will need to be achieved, especially in patient volume. Given the fact that patient volumes this year are below those of last year, it will be imperative that efforts are made to address this challenge in a very proactive manner. There was clear recognition and commitment by our clinical chairs to work with the hospital leadership to do so.

Remembering Dr. Belding Scribner

Dr. Belding Scribner, an alumnus of Stanford University School of Medicine died this past week from an accident near his home in Washington. He was 82 years of age. Dr. Scribner invented a device named after him – “the Scribner Shunt” – that made dialysis feasible. Together with Dr. Willem Kolff, Dr. Scribner shared the 2002 Albert Lasker Award for Clinical Medical Research. The Lasker Foundation stated “Kolff and Scribner’s development ... changed kidney failure from a fatal to a treatable disease, prolonging the useful lives of millions of people.” Dr. Scribner was a faculty member at the University of Washington since 1951.

Congratulations to Dr. Paul Utz

Stanford University School of Medicine has been awarded a three-year grant as part of the Dana Program in Human Immunology. This grant is for the Project *Novel Diagnostics and Therapeutics for Systemic Lupus Erythematosus*, and is being made in response to the application to the foundation by Paul J. Utz, M.D. Congratulations Dr. Utz.

Welcome and Farewell

The School of Medicine is pleased to welcome Ms. Marcia Cohen, Assistant Dean for Fiscal Affairs. Ms. Cohen previously held the position of Director of Finance for the Department of Medicine at the University of California in San Francisco.

In welcoming Ms. Cohen, however, we bid farewell to Carol Buffum who has served Stanford’ School of Medicine for 15 years. Good luck, Carol, in your future endeavors.

We would also like to welcome Ms. Debra Ketchell as the new Director of the Lane Library and Associate Dean for Knowledge Management. Debra had been the Deputy Director of the Health Sciences Libraries at the University of Washington and we are fortunate to have her join us here at Stanford.

Office Relocations

The Office of Student Affairs, currently located on MSOB 3rd floor, will be undergoing renovations. The renovation project is slated to end in late August. This has resulted in almost all of the staff re-locating their offices. Right now the phone moves have been delayed and may be difficult to reach people directly for the next couple of weeks. We will have signs directing people to where people are now located and to reception.

The Office of Postdoctoral Affairs has been relocated to CCSR 4435. All of the Biosciences Admissions staff along with the Interdisciplinary programs of Cancer Biology, Immunology and Neurosciences have been relocated to Alway M103-105.

The Office of Continuing Medical Education has relocated to the third floor of MSOB.

The Office of Medical Development has relocated to 2700 Sand Hill Road, Menlo Park. Please note their new contact numbers: Phone: 650-234-0600 Fax: 650-234-0644

Appointments and Promotions

- **Rosemary Butts** has been reappointed to Associate Professor (Research) of Radiology, effective 6/1/2003 to 5/31/2009.
- **Bruce Daniel** has been appointed to Assistant Professor of Radiology (Interventional Radiology), effective 7/1/2003 to 6/30/2006.
- **Abby King** has been promoted to Professor of Health Research and Policy and of Medicine, effective 7/1/2003.
- **Thomas Robinson** has been promoted to Associate Professor of Pediatrics and of Medicine, effective 7/1/2003.

Dean's Newsletter July 28, 2003

The Near Final Talley: School of Medicine Class Entering 2003

Thanks to the efforts of Dr. Gabriel Garcia and the Admissions Committee, we are once again looking at an absolutely stellar incoming class of medical students who will be arriving in late August. Because of the many changes in the New Curriculum, orientation has been moved to the last week in August and classes will begin on September 2nd in order to permit more time for participation in the curriculum.

This year the Admissions Office received over 5,436 applications for 86 places. Of these, 195 were eventually offered admission. Although the class is not yet fully finalized, of

those who will be entering this September, 54% are women and between 16-18% are underrepresented minorities. Although a number of students come from several schools [Stanford (14), Harvard (10), Berkeley (7), Other UC (8), Princeton (3), Yale (3), Brown (3), Duke (3), Univ. Arizona (3), MIT (2)], the remainder come from a wide diversity of colleges and universities. We look forward to meeting all of our new students later this summer.

Scholarly Concentration Aligns with UC-Berkeley

As you know, we will be initiating the New Stanford Curriculum with the arrival of our incoming class of medical students in early September. A key feature of the curriculum is the scholarly concentrations that will permit our students to pursue areas of interest and scholarship with depth, research and commitment throughout their medical school experience. Among the eight Scholarly Concentrations that will be offered this Fall is one in “Community Health and Public Service”. As with the other Scholarly Concentrations, it is our hope and intention that selected students will have the opportunity to pursue an advanced degree in addition to the Doctor of Medicine degree. Accordingly, I am very pleased to inform you that on July 8th the School of Medicine completed a Memorandum of Understanding with the School of Public Health at the University of California, Berkeley. This agreement will allow selected medical students to complete a dual-degree MD/MPH program at Stanford and Berkeley.

The goal of the program is to train medical students to be effective physician scholars and leaders via a multi-year cross-institutional collaboration in the field of public health. Beginning in fall of 2004, a select group of students enrolled in the Scholarly Concentration in Community Health and Public Service will have the opportunity to combine their community-based service and research with a formal curriculum in public health. The advantage of this program over a traditional one-year MPH curriculum is that it incorporates an in-depth, longitudinal and scholarly field project, spanning 2-3 years. In addition, some course work from Stanford can be applied toward the MPH degree requirements at Berkeley. The program will allow medical students to integrate and apply their public health training and perspective throughout their medical education.

I want to thank in particular Ann Banchoff, Associate Director of PriSMS, Neil Gesundheit, Associate Dean for Medical Education, Julie Parsonnet, Senior Associate Dean for Medical Education and Mary Lake Polan, Chair of Obstetrics & Gynecology, for their work and leadership in bringing this effort to fruition. Similar appreciation goes to faculty leaders at UC-Berkeley (Zak Sabry, Nap Hosang, John Caso and Tom Boyce) for making this collaboration possible. Dr. Stephen Shortell, Dean of the School of Public Health at UC Berkeley, and I are very enthusiastic about this new collaborative educational program and look forward to its positive impact on our students and the interactions between our schools and universities.

Planning for the Stanford Institute for Cardiovascular Medicine

At the Executive Committee meeting on Friday, July 18th, we heard an exciting presentation about the work underway on developing the Stanford Cardiovascular Institute. During the last several months a diverse multidisciplinary group of investigators and clinicians across the School and University have been working to develop the proposal for this new Institute. Dr. Judy Swain, Chair of the Department of Medicine, led the presentation but was joined by colleagues who have been working with her, including Drs. Dan Bernstein (Pediatrics), John Cooke (Medicine), Steve Fortmann (SCRDP), Mark Hlatky (Surgery), Daria Mochly-Rosen (Molecular Pharmacology), Dan Murphy (Pediatrics), Richard Popp (Medicine), Tom Quertermous (Medicine), Marlene Rabinovitch (Pediatrics), Bobby Robbins (CT Surgery), Charlie Taylor (Mechanical Engineering/Surgery), Alan Yeung (Medicine) and Paul Yock (Bioengineering). This group, together with their colleagues, has defined the mission of the Stanford Cardiovascular Institute as follows:

- *To bring together scientists, engineers and clinicians in interdisciplinary programs to develop new knowledge, and the to translate this knowledge into new scientific insights, diagnostic methods, preventive strategies, and treatments for patients with cardiovascular disease.*
- *To educate future leaders in cardiovascular science and medicine through the development of new and innovative educational programs that are an integral part of the clinical and research programs.*

The Organizing Committee proposes to achieve this mission through the integration of five centers:

1. The Stanford Cardiovascular Center (for adult patient care and clinical research of new devices and therapies) that will be led by Drs Bobby Robbins and Alan Yeung.
2. The Packard Cardiovascular Center (for pediatric care and clinical research) that will led by Drs. Dan Bernstein, Frank Hanley and Dan Murphy.
3. The Center for Population Studies (which will focus on health outcomes, policy, epidemiology and prevention) and that will be led by Drs. Steve Fortmann, Alan Garber and Mark Hlatky.
4. The Laboratory Sciences Center (which will focus on fundamental as well as translational research) that will be led by Drs. Sam Gambhir, Daria Mochly-Rosen, Tom Quertermous and Marlene Rabinovitch.
5. The Cardiovascular Bioengineering Center that will be led by Drs. Norbert Pelc, Richard Popp, Charlie Taylor and Paul Yock.

The group outlined exciting proposals in education, research and patient care building on the extant research themes already underway at Stanford, including the:

- Genetics of cardiac and vascular diseases
- Cardiovascular and pulmonary development
- Vascular biology and disease
- Risk assessment, early diagnosis and prevention of cardiovascular disease
- Regenerative medicine and transplantation

□ New diagnostics and therapies

The current depth of expertise in these areas at Stanford - in the School of Medicine and across the University - is already quite impressive. Of interest, the group also felt that to make the Institute exciting and meaningful, it should also have a “*grand challenge*” and the one they chose is to “*eliminate heart failure as a leading cause of death and disability*”. This is based on the fact that heart failure is the final common pathway of all cardiac disease and represents a major public health problem, with an estimated 4.8M Americans affected. Moreover, the incidence appears to be increasing and is associated with a high mortality. Focusing on this problem also brings together the work of investigators and clinicians in all five centers and with a wide area of expertise and knowledge.

There was considerable enthusiasm for the work already done on the proposal and the recognition that this was still at a nascent stage of development. That said, the scope of the opportunity has really taken shape. During the next weeks we will work out the process for selecting a director for the Stanford Cardiovascular Institute and anticipate that with that, considerable additional progress will be made.

I want to offer my sincere appreciation to Dr. Swain and the many faculty who have worked on the proposal to date. It offers excellent evidence of opportunities for interdisciplinary education, research and patient care. Importantly, it is also building momentum from a faculty perspective - which, the end, will sustain this program most successfully.

Naturally I will be providing additional details and updates as they unfold in the months ahead.

Summer: Budgets and Time

While summer session is a time for reduced schedule and activities in many parts of the University, that is far from the case at the School of Medicine. In fact, summer is one of our busiest times in the Dean’s office, since we are reviewing and finalizing the budget for the next fiscal year that will begin on September 1st. That means many hours of meetings, volumes of data to review and the active participation of department chairs, DFA’s and numerous staff throughout the School. It is an enormously laborious process. I want to thank all the individuals who have worked so hard to assist in this process. Their tasks have been made more challenging because of the many difficulties with the IT systems re-engineering that are underway throughout the university.

Our budget tasks are made even more challenging because of the current fiscal climate. With the economy in a slump our endowment is down, which means considerably less revenue. Further, expenses for capital improvements, benefits and malpractice insurance are all increased, putting a strain on our fiscal situation. To get through this year and still support our important strategic initiatives, we have elected to spend down some of our reserves. However, that can only be viewed as a short term process and, unless things

change in the next months, we will clearly need to further reduce expenses for the FY05 fiscal year.

Again, I want to thank all of our staff who have labored enormously to assist with the budget and planning process. We truly appreciate your efforts.

Visiting the Clark Center

The gates are down and the pathways are nearly clear. As July unfolds, the roads and pathways to the new Clark Center have an ever-increasing number of faculty and students entering from the Medical School as well as from the Schools of Engineering and Humanities & Sciences. Joining them are numerous visitors. There is much to admire in the new facility that epitomizes much of Stanford both now and in the future. Its open environment, which is flexible, utilitarian and novel, fosters change and interaction. Most importantly, the Clark Center symbolizes multidisciplinary research and education with faculty and students coming from four schools and 24 departments (ranging from Applied Physics to Surgery). It is truly a unique environment and worth a visit. The official dedication of the Clark Center will be October 24th.

Official Stanford Emblems

The University has recently issued official guidelines for the use of Stanford emblems that I have been asked to share with you. Here is the message:

The Design Guidelines (<http://www.stanford.edu/group/identity/>) contain the new "look" for stationery and business cards that is adaptable for use by all members of the campus community. The new design is an attractive and elegant look. Although use of the new designs is voluntary, they have already been adopted by a number of groups around campus for stationery, and you can see them on this year's Budget Book and Annual Report.

The website also includes some very practical tools. There is downloadable artwork for the Block S and University seal appropriate for different media, including the web. We have a link to Color Copy, a local printer who will take online orders for business cards and stationery at very favorable prices if you use the new designs contained in the style guide (<http://clients.myprintagent.com/stanford/>). This is a quick and easy-to-use online tool that may help you reduce your program's printing costs.

The new designs are a very effective way to reflect the traditions and standards of excellence that are hallmarks of Stanford's image across the great variety of programs included in our campus community. Although we are not asking that any current materials be destroyed, we ask that as you order new stationery and other program materials, you will consider how the new Stanford identity elements might be successfully incorporated into your individual program look.

Hospital Updates

A Joint School of Medicine/Stanford Hospital Leadership Council has been established to enhance interactions between the school and hospitals on clinical planning and operations related to SHC. The Leadership Council, which is comprised of clinical chairs and hospital leaders, will meet biweekly. The current membership includes Martha Marsh as chair along with Drs. Gary Glazer (Brook Jeffries while Dr. Glazer is on sabbatical) from Radiology, Tom Krummel from Surgery, Ron Pearl from Anesthesia, Bruce Reitz from Cardiothoracic Surgery, Gary Steinberg from Neurosurgery and Judy Swain from Medicine. Also participating will be Michael Calhoun, Nancy Lee, Mike Peterson and Jerry Shefrin from SHC along with Mike Hindery, Norm Rizk and Phil Pizzo from SoM.

At the Lucile Packard Children's Hospital Board of Directors Meeting on Wednesday, July 23rd, Drs. Ken Cox and Bill Feaster gave an update on the plans for the Pediatric/Obstetric Faculty Practice Plan that will be jointly governed by the School of Medicine and LPCH. This plan has been under development for nearly two years but its current iteration represents an outstanding cooperative effort designed to improve collaboration, management and joint responsibility between the faculty and the hospital – all to improve patient care and financial responsibility and accountability. It will become operational in the next months. I want to commend Drs. Cox and Feaster along with the numerous faculty and hospital leaders who worked to make this Faculty Practice Plan become a reality.

Events

Asian Community Luncheon: On Thursday July 17th, an Asian Community Luncheon was held in the Bing Dining room to bring together leaders from the business and medical communities. It was an opportunity to share some of the exciting things that are happening at Stanford Medical Center. The featured speaker for the event was Dr. Alan Yeung, Co-Director of the Division of Cardiovascular Medicine in the Department of Medicine, who gave an excellent presentation about the exciting work unfolding in the Heart Center at Stanford Hospital & Clinics and its important relationships to the Stanford Institute for Cardiovascular Medicine (see above). The opportunities to develop important linkages between our research and patient care programs through “translational medicine” are particularly opportune at Stanford - and already well expressed in cardiovascular medicine.

15th Anniversary of Stanford's BMT Program: On Saturday, July 26th, Stanford University Medical Center celebrated the 15th anniversary of the bone marrow transplant program. Attending this event were nearly 300 patients, each more than a year post transplantation and 1100 family members. This was not merely a celebration of the program but more importantly a celebration of courage, strength and life.

Announcement

Initiation of Staff Seminars on the Respectful Workplace: As you may know, the School of Medicine has recently completed the inaugural series of briefings regarding the "Respectful Workplace" for all faculty and clinician educators. As we continue developing a more respectful workplace, other initiatives for faculty and clinician educators will be implemented. Meanwhile, under the direction of the Human Resources Group, the School is now embarking on presenting similar briefings for staff. These important briefings will review the School's Respectful Workplace policy, techniques to improve a respectful workplace culture, and current legal issues including sexual harassment in the academic workplace along with resources available to assist in addressing concerns that may arise.

A 90-minute pilot program for these Staff Briefings will begin with five departments in August. Following the pilot, the program will be rolled out in the Fall, and all School of Medicine staff will be asked to attend these briefings. The presenters will include:

Cori Bossenberry - Director, Human Resources, School of Medicine
Martha McKee - Ombudsperson, School of Medicine
Judith Moss - Training/Organizational Development Specialist, Campus HR
Norma Leavitt - Associate Director of Employee Relations, School of Medicine

More information concerning these briefings will be sent directly to Department Chairs and DFAs as the briefings are implemented for their departments.

Appointments and Promotions

- ***Ellen Jo Baron*** was promoted to Professor of Pathology at the Stanford University Medical Center, effective 7/1/2003.
- ***John Chan*** was appointed to Assistant Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 7/1/2003.
- ***Charles DeBattista*** was promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 6/1/2003.
- ***Edith Sullivan*** was promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 7/1/2003.
- ***Andrew Zolopa*** was promoted to Associate Professor of Medicine (Infectious Diseases and Geographical Medicine) at the Stanford University Medical Center, effective 7/1/2003.

Dean's Newsletter

August 18, 2003

Stanford Brain Research Institute (aka Stanford Neurosciences Institute)

Building on the considerable accomplishments of the Stanford Brain Research Center (SBRC) over the past several years, Dr. Bill Mobley and colleagues (including Ben Barres, (Neurobiology), Robert Fisher (Neurology and Neurological Sciences), Griffith Harsh (Neurosurgery), Eric Knudsen (Neurobiology), Rob Malenka (Psychiatry), David Prince (Neurology and Neurological Sciences) Terence Sanger (Neurology and Neurological Sciences), Eric Shooter (Neurobiology), Gary Steinberg (Neurosurgery), Richard Tsien (Molecular and Cellular Physiology), and Midori Yenari (Neurosurgery)) presented the plans for the Stanford Brain Research Institute (aka Stanford Neurosciences Institute) to the Executive Committee on August 1st. The vision for the SBRI is to develop a new culture for neuroscience that involves and encourages the interaction of scientists and clinicians in an interdisciplinary environment to support and enhance fundamental discovery (including studies of disease pathogenesis) and that supports clinical research and the application of discoveries to the care of patients. In sum, the SBRI would be the engine for neuroscience discovery and translation at Stanford.

The discipline of modern neuroscience crosses all areas of biological organization, from genes to cells to circuits to behavior – and from fundamental discovery through clinical research. This requires a new way of thinking and working together – including methods to foster and support collaboration. Accomplishing this goal is made easier by the existing neuroscience community at Stanford (currently as the Stanford Brain Research Center). The SBRC includes approximately 90 faculty from 15 departments and three schools. It is a highly distinguished group, well recognized for contributions to research and patient care – and also for an outstanding graduate program. Facilitating interactions among these faculty and students occurs through regular faculty meetings, a lecture series, collaborative research programs, and this year a highly successful retreat. With the ultimate inception of the Institute, there will be even greater sharing and interaction – ideally by co-locating some members of the Institute in contiguous space but also by extending the interactions virtually throughout the Stanford community and, where appropriate and feasible, to other academic medical centers or research institutes. Hopefully this will be achieved through the Stanford Institutes of Medicine #1 (SIM-1) building that will be part of the Science, Engineering, Medicine Campus over the next several years.

As currently envisioned, the SBRI would be comprised of theme groups including:

- Development, Growth and Developmental Disorders
- Degeneration, Regeneration and Recovery
- Normal and Abnormal Behavior

There would also be a Working Group on Synapse and Circuit Dysfunction. The recently announced Center for Down Syndrome Research and Treatment would be part of

the SBRI. Also planned are several cores, including: cells and molecular technology, mouse models, neuroimaging, behavior, and informatics.

Importantly, the SBRI would have important interactions with other interdisciplinary efforts at Stanford including other Institutes of Medicine, BioX, the Children's Health Initiative, and GRECC – thus further enhancing the overall interdisciplinary efforts now characterizing the Stanford community. Accordingly, in addition to fostering novel research opportunities and, hopefully, improved patient care, the SBRI will also offer a unique setting for students at all levels of training and development.

The next immediate goals will be finalizing the directorship of the SBRI (an announcement should be available in September) along with the plans for recruitment of additional faculty (both research and clinical), each of whom will have a departmental home as well as membership in the SBRI. The other major immediate challenges will be raising the funds to support the Institute's initiatives – from both private philanthropy as well as public (e.g., NIH) sources. And, as mentioned above, the physical space that will give identity and life to the SBRI is equally essential.

At this juncture we have had three exciting initiatives brought forth for our Stanford Institutes of Medicine. Indeed, soon to join the already announced Stanford Institute for Cancer/Stem Cell Biology and Medicine will be the Stanford Cardiovascular Institute and the Stanford Brain Research Institute (aka Neurosciences Institute).

United Educators Report on Stanford's "Respectful Workplace" Initiative

Ensuring that the School of Medicine fosters a "Respectful Workplace" is among my highest priorities. We all have a right to expect this and it is inappropriate and intolerable when this is violated. Accordingly, the Dean's Office has responded rapidly to concerns that have risen from faculty, staff and students – and we will continue to do so. We also began a series of departmental briefings on the Respectful Workplace in the spring of 2002 (see May 13 2002 issue of the *Dean's Newsletter*) that have now been completed, and this summer we commenced additional educational sessions on the "Respectful Workplace" for staff members. I want to especially thank Dr. David Stevenson, Senior Associate Dean for Academic Affairs, along with Ms. Cori Bossenberry, Director of Human Resources for the School of Medicine; Tom Fenner, Deputy General Counsel; Ms. Ellen Waxman, Director of Faculty Relations; and Ms. Martha McKee, Ombudsperson, School of Medicine, for the enormous amount of work and commitment they have provided. I also want to thank our department chairs – and our faculty, students and staff – for their participation in these sessions and, most importantly for their efforts in helping to ensure a "respectful workplace".

This past week I received a letter from Ms. Janice Abraham, President and CEO of United Educators, commenting on the significant progress that we have made in the School of Medicine in helping to ensure a respectful workplace. She noted that the School was highlighted in the Summer 2003 issue of their "Employment Action"

newsletter that is sent out to schools, colleges and universities across the country. The full article is posted on their web site <http://www.ue.org/>.

Reminders on Emergency Preparedness

Reflecting on the recent events in the northeast, David Silberman, Director of the School of Medicine's Health and Safety Program, offered some helpful comments and suggestions that are worth reading. "The recent Northeastern power outage demonstrates that emergencies arise unexpectedly, come from unanticipated sources and can have devastating effects on an institution's teaching, research and clinical missions. Though the cause of the outage is still under investigation, there is no question about its impact. Every researcher and every office in the affected area was shut down. Research was put at risk, critical financial and organizational processes were compromised and personal stress levels reached unanticipated heights."

Taking some simple, pro-active precautions will significantly reduce your risk of losing valuable data, research samples, and other important information, when such an event occurs in our area.

For Researchers:

- Have a plan for dealing with samples in freezers or incubators that are without power for an extended period of time.
- When you reach a critical stage in a research project, duplicate your samples or data results and store a copy in an off site location.

For Everyone:

- Have a plan for communicating with your staff during an emergency.
- Consider purchasing Uninterruptible Power Supply (UPS) units for sensitive equipment. These units protect equipment from power surges and provide a short-term power supply to allow you to shut down equipment properly after an outage.
- Make certain that your Department Emergency plan is up to date and that all staff are aware of the contents of the plan.

In addition to taking precautions to protect your material at Stanford, protecting yourself and your loved ones is just as important. Here are some basic guidelines for preparing yourself for all types of emergencies.

1. Have an emergency plan, be it personal, family, workplace, or neighborhood
2. Have emergency kits for home, work and car with an adequate supply of
 - Drinking water
 - Non-perishable food with a manual can opener
 - Flashlights (no candles; they are a fire hazard)
 - Battery-powered radio
 - First aid kits
 - Extra supply of medications
 - Walking shoes, warm cloth, lightweight rain gear

- Writing kit with paper, marking pens, tape
- Cash in small denominations
- 3. To lessen the burden on the phone systems, always have an out of state emergency contact person.
- 4. Have important documents and inventories prepared ahead of time and copies stored off-site.
- 5. Know your community resources, get involved, and get trained.

Educate yourself about emergency response by visiting some of the excellent web resources available to you.

- San Francisco Office of Emergency Services: <http://www.sfgov.org/oes>
- California Office of Emergency Services: <http://www.oes.ca.gov/>
- United States Geological Survey Earthquake Hazards program: <http://quake.wr.usgs.gov/>

School of Medicine Health and Safety Office

- **Phone:** 723 0110
- **Email:** somsafety@stanford.edu

This is advice worth paying attention to.

The Continuing Challenge of IT Conversion - New Oracle-based Financial System

The following communication is being included for information – and comes from a message prepared by Mike Hindery, Cori Bossenberry and Marcia Cohen. As you likely know, the University is getting ready for the September 1st implementation of the Delphi Project, which will replace five existing "legacy" administrative applications with Oracle products. This new system will change the way nearly every financial transaction is conducted - ranging from ordering paperclips to disbursing funds in multimillion-dollar research grants. In addition, our equipment and space inventory systems are changing as well. Understandably, the introduction and use of these new systems into our School will create a tremendous change in how we do business.

Many staff have been spending time helping the School to plan for this major implementation and attending campus-sponsored training. During September and for the next several months, in addition to their regular workload, staff will be spending a lot of time in training sessions, learning to use these new systems, reviewing changes to financial policies and learning new business practices. We anticipate that these new systems will pose a major challenge for our staff. In addition, as with any new system, there are features that will not be fully functional for some period of time. We would particularly like to acknowledge and thank the School's administrative staff for their extra effort during this transition.

In light of this, I ask that department leadership carefully monitor workloads and prioritize projects and duties appropriately - which may cause some priorities to be

delayed until a more appropriate time. During this busy and stressful time, I would also ask that all of us make every effort to be patient and understanding as well as sensitive when making demands and placing any greater expectations on staff.

Thank you, in advance, for your continued cooperation and assistance in conducting the business of the School of Medicine.

IOM Report on Academic Health Centers. Leading Change in the 21st Century.

The Institute of Medicine has recently issued its report on “Academic Health Centers. Leading the Change in the 21st Century.” You can review the Executive Summary at <http://www.iom.edu/file.asp?id=13779>. The Committee offered a number of recommendations and, as with the report of the Commonwealth Foundation that I reported in the March 3rd 2003 issue of the Dean’s Newsletter, our Strategic Plan for Stanford School of Medicine appears to be right on target. Among the recommendations appearing in the IOM report are the following:

- **Reforming the Education of Health Professionals:** The Committee recommends that AHC’s should take the lead in reforming the content and methods of health professions education to include the integrated development of educational curricula, including a focus on interdisciplinary education, advanced teaching environments and improved computational skills to enhance understanding of the new biological sciences. The Committee further recommends that Congress should support innovations in clinical education through changes in the financing of clinical education.

At Stanford, our Strategic Plan “Translating Discoveries” which can be viewed at <http://medstrategicplan.stanford.edu/> addresses our commitment to education and indeed, the New Stanford Curriculum that will commence in just a few weeks and that focuses on parallel learning in basic and clinical sciences. The formation of “Scholarly Concentrations” offers ample evidence of the work we have already done in this important area. While there is much to be done, I think it is clear that we are taking a lead in this important area.

- **Demonstrating New Models of Care.** The Committee recommended that AHCs should design and assess new structures and approaches for patient care. Specifically, they recommend that these should work across disciplines to improve health and prevent disease.

At Stanford, while there is much work to be done, we have recognized the importance of interdisciplinary care both as it relates to “centers of excellence” as well as new programs (e.g., plans for an interdepartmental vascular center). Measuring and assuring quality is also of critical importance, especially since in the immediate future, evidence of quality will likely guide referrals and reimbursement. This is an area that deserves continued attention and needs additional work – but we have a commitment to such.

- **Translating the Discoveries of Science into Improved Health.** The Committee highlighted that health-related research should span the continuum from discovery to testing to application and evaluation. They specifically note that AHCs should “increase their emphasis on clinical, health services, prevention, community-based, and translational research that can move basic discoveries into clinical and community settings.

At Stanford, we have a long record of translational research and have given this a high priority in our Strategic Plan “Translating Discoveries”. It should be again emphasized that it is important to not over-manage this area but, importantly, to foster an environment that values translational medicine. This has happened within the School and University by a number of mechanisms: the Bio-X Interdisciplinary Initiatives, the Beckman Center/Department of Medicine program to support translational discovery and the recent formation of the Stanford Institutes of Medicine are all examples. It is equally important to underscore that the translational research of today is based on the basic science investigation of the past years and decades. So, it is important to find the right balance between support for basic fundamental research (which remains among our highest priorities at Stanford) and translational research (which is also a high priority). Since we are among the smallest of the research-intensive schools of medicine, it is important that we make strategic choices (as we have tried to do by developing the School’s Strategic Plan) but also that we invest resources in research and application that is of the highest quality we can find. I do believe that this is an area where we can most definitely excel in the years ahead.

- **Utilizing Information and Communications Technology.** The Committee recommends that AHCs need to make innovations in information technology a priority for integrated teaching, research and clinical activities

At Stanford, we have recognized the importance of IT in our future. Indeed, that was one of the reasons for creating the position of Senior Associate Dean for Information Resources and Technology within the School. During the past 18 months, Dr. Henry Lowe and his colleagues have crafted a broad strategic plan for IT that focuses on education and research but that also attempts to work collaboratively with our hospital partners to impact patient care. As we look to the future, the planning for the Stanford Medicine Information and Learning Environment (SMILE Project) is highly focused on the use of information technology to create immersive learning environments as well as a knowledge center that will transform the way our students and postdoctoral trainees, as well as faculty and staff, learn and process information in the future. This is a dynamically changing but very exciting area and I remain confident that we demonstrate true leadership in bringing new programs to fruition in the years ahead.

- **Establishing and Measuring AHC-wide Goals for Change.** The Committee recommended that both AHCs and the public should evaluate the progress of

AHCs in redesigning the content and methods of clinical education; in developing organizational structures and team approaches in care to improve health; and in increasing the emphasis on health services, clinical prevention and translational research.

At Stanford, we have recognized the importance of making progress in these and other areas and have been careful to set timelines and benchmarks for our various strategic initiatives. I have tried to update you on a regular basis about how we are doing – again recognizing that our progress cuts across multiple missions and is also limited by precious resources, especially in space, people and dollars. Nonetheless, I do believe we have made considerable progress during the past couple of years and look forward to the additional accomplishments that should follow in the time before us. Ultimately, demonstrating the value of academic medical centers to the public – and re-engaging the public trust in what we are trying to accomplish – is one of our highest and most important priorities.

- **Leadership for Strategic Change Throughout the AHC.** The Committee recommends that AHCs must be leaders and must develop new leaders who can manage organizational change in the key missions of education, research and patient care, can improve integration and, ultimately, can improve health by providing guidance on pressing societal problems and issues that effect our nation.

At Stanford I believe we have recognized the importance of leadership and are intent in playing a role by being a role model among research-intensive schools of medicine. Our New Curriculum is designed to create future leaders. Our Senior Dean's, Department Chairs – as well as our faculty, students and staff – are engaged in the implementation of the important changes that are ensuing from our Strategic Plan “Translating Discoveries”. We have also been attentive to challenging important advocacy issues (e.g., stem cell research) that impacts the important issues facing medicine in the 21st Century.

Clearly, as one of 125 Schools of Medicine, and one of the smallest, our strategic efforts need to be carefully defined, managed and monitored. And while there is much to accomplish, I do believe we are making important progress – and, as much as possible, anticipating the future, as evidenced by the fact that we are already deeply involved in implementing the recommendations that have come from the Commonwealth Foundation and now, more recently, from the Institute of Medicine. We have much to do – but I do want to thank each of you for already having done so much.

NRC/IOM Report on Enhancing the Vitality of the National Institutes of Health

During the past weeks, the National Research Council and the Institute of Medicine issued a press release on the organizational changes needed at NIH to pursue more innovative, crosscutting and strategic research. The full report will be available in

September but the information released to date has attracted considerable attention and interest. A prestigious Committee brought forth these recommendations that, I am pleased to say, included Judy Swain, Chair of the Department of Medicine. This is an extremely important report and I am pleased that the Committee had the benefit of Dr. Swain's input. In September you will be able to access the report from the web site <http://www.nap.edu>.

Hospital Updates

At the Stanford Hospital & Clinics (SHC) Board of Directors Meeting on August 7th, there was considerable discussion about the efforts underway in cancer care and research. As you know, cancer is one of the major priorities for the School as well as both SHC and LPCH. We are collaborating across the School and Hospital in the Stanford Cancer/Stem Cell Biology and Medicine Institute (also known as the Cancer/Stem Cell Institute, or CSCI) that creates an umbrella connecting basic research, clinical and translational research and patient care. The visible evidence of the SUMC commitment to cancer care is further evidenced by the opening of the new Cancer Center, which is scheduled to open in the early part of 2004. Anticipating this new facility, several updates were provided:

- Progress in further developing the leadership of the Cancer/Stem Cell Biology and Medicine Institute is underway by the recruitment of an internationally recognized leader in cancer research who, when identified and appointed, will become the Principal Investigator of our application for an NCI Comprehensive Cancer Center designation (see below). The Search Committee is being lead by Dr. Irv Weissman and the members of the CSCI. The incumbent will also hold the Ludwig Professorship for Clinical Cancer Research (Dr. Lucy Shapiro, Director of the Beckman Center, is the Virginia and D. K. Ludwig Professor for Basic Research).
- Dr. Karl Blume, Associate Director of the CSCI, gave a progress report to the SHC Board on the application process for the NCI Comprehensive Cancer Center. Since February he has made considerable progress in identifying the key basic, clinical and population based areas of research as well as the program leaders. He has assembled an impressive interdepartmental as well as interschool faculty who will be participating in the grant application, which will be submitted for an October 2004 deadline. This is a highly ambitious schedule but considerable momentum has already been achieved. In addition to identifying key program leaders, we are planning a Retreat on the NCI Cancer Center for Saturday November 15th that will be held in the Clark Center. If you have not already been contacted and would like to attend please contact Sharon Olsen at solsen@stanford.edu. In addition, an outstanding External Advisory Committee has been assembled to review our plans for the NCI application. The Committee will visit Stanford in February of 2004.
- Dr. Richard Hoppe presented an update on the planning of the Steering Committee and its relation to the business plan being compiled by SHC for cancer care. This is an important work-in-progress that will focus on key areas for development as well as the recruitment of faculty and staff. Among these is the

recruitment of the Clinical Cancer Center Director, the search for which is currently ongoing and which is being co-chaired by Dr. Blume and me. We are hopeful that we will identify the final candidate in the next several months. In the interim, Dr. Richard Hoppe has kindly agreed to take on the leadership role so as to assure that the necessary progress and momentum is sustained. I very much appreciate Dr. Hoppe's willingness to take on this responsibility and am also appreciative to Dr. Sarah Donaldson, who will relieve Dr. Hoppe of his administrative responsibilities as Chair of the Department of Radiation Oncology until the new Clinical Director is in place.

There is a considerable amount of activity surrounding our cancer programs – both in research and clinical care. The next year should prove particularly exciting.

In addition to the efforts in cancer care, the SHC Board meeting also focused on the overall strategic plans for the hospital and their relation to the School and faculty. These involve programs in Palo Alto as well as potential areas of development in the north, south and east. Forming strategic alliances and partnerships to better serve our community is among the highest priorities. Accordingly, for some time we have been having discussions with the leadership of the Palo Alto Medical Foundation and during the past summer, those discussions have become more focused and have included dialogue with the medical group at PAMF as well as the clinical department chairs and, in turn, with the clinical faculty, at Stanford. There is much to justify a more formal relationship between Stanford and PAMF, recognizing that prior attempts to do so have not been successful. However, the dramatic changes facing all of us today mandate a fresh look at such relationships. This will be an important area for discussion during the next couple of months and as the details emerge I will communicate them to you.

Awards

- **Dr. Marlene Rabinovitch**, Dwight and Vera Dunlevie Professor in Pediatric Cardiology and, by courtesy, of Developmental Biology, has been named the 2003 Gill Heart Institute Award winner. This award is administered in conjunction with the University of Kentucky. This is a most distinguished (albeit relatively new) award and Dr. Rabinovitch joins a distinguished group of prior awardees that include Eric Topol, L. Henry Edmunds, Christine & Jonathan Seidman, Eric Olsen and Valentin Fuster. We are so very pleased to have Dr. Rabinovitch on our faculty and congratulate her on this new award.
- **Dr. Irv Weissman** has received another accolade for his work, this being the 19th J. Allyn Taylor International Prize in Medicine. This too has had a distinguished lineage of past winners that include Ron Kahn, Eric Lander, Craig Venter, Judah Folkman, Mike Gimbrone – and, from Stanford, Hugh McDevitt. Congratulations (again) to Dr. Weissman.

Appointments and Promotions

- **Michael Bellino** has been appointed to Assistant Professor of Orthopedic Surgery at the Stanford University Medical Center, effective 8/1/2003 to 7/31/2006.
- **Alice Edler** has been appointed to Assistant Professor of Anesthesia at the Stanford University Medical Center, effective 8/1/2003 to 7/31/2006.
- **Sanjiv Gambhir** has been appointed to Professor of Radiology, effective 8/1/2003.
- **Iris Gibbs** has been reappointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 8/1/2003 to 7/31/2007.
- **Nicholas Giori** has been appointed Assistant Professor of Orthopedic Surgery at the Palo Alto Veterans' Affairs Health Care System, effective 8/1/2003 to 7/31/2006.
- **Dominik Fleischmann** has been appointed to Assistant Professor of Radiology at the Stanford University Medical Center, effective 8/1/2003 to 7/31/2006.
- **Max Kanevsky** has been appointed Assistant Professor of Anesthesia at the Stanford University Medical Center, effective 8/1/2003 to 7/31/2006.
- **Stephen Kee** has been promoted to Associate Professor of Radiology (Cardiovascular and Interventional Radiology) and, by courtesy, of Surgery at the Stanford University Medical Center, effective 8/1/2003.
- **Lei Xing** has been appointed to Associate Professor of Radiation Oncology, effective 8/1/2003 to 7/31/2009 (Radiation Physics).

Dean's Newsletter September 2, 2003

Welcome to New Medical Students.

For our 86 new medical students, classes began earlier this year than usual in order to accommodate to the exciting New Stanford Curriculum that begins this Fall. With Orientation complete, our new students will begin classes today – and I want to take the opportunity to welcome them and wish them wonderful success at Stanford. We are all very pleased and proud to have them as new members of our Stanford family and community.

State-of-the-School: 2003

With the opening of the new academic year, I thought it would be helpful to offer a brief update on the State-of-the School. It is an exciting time at Stanford and I hope that the comments that follow provide an update about some of the exciting things that have been going on.

Our Mission:

To be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovations in patient care, education and research.

Our Goals:

- Lead the movement to reform and rejuvenate the educational and career development of biomedical innovators.
- Transform the future of biomedical, translational and clinical research, and education by fostering novel collaborative alignments between basic and clinical scientists, clinicians, and educators throughout the University, as well as with public and private partners worldwide.
- Earn the public's trust and respect as a premier medical school through outstanding patient care and academic medicine.

From *Translating Discoveries: A Strategic Plan for the Stanford University School of Medicine*

Stanford University School of Medicine is a unique and special institution that is committed to serve as a role model for the transformation of American medicine at this important juncture in history. As we begin the 21st century, we are the beneficiaries of remarkable discoveries and innovations emanating from science and technology during the past several decades. Indeed, we stand poised to rapidly expand knowledge in basic biomedical science that will lead to new insights into the etiology and pathogenesis of human disease, and that will permit us to translate discoveries to improve their diagnosis, management and prevention. Ironically, at the same time, we are also the recipients of a health care system that suffers from disparity, problems in accessibility and financial challenges that impact the very integrity of academic medical centers across our nation. Accordingly, it is essential that Stanford serve as a leader in the training of physicians and bioscientists, in discovery and innovation and in the translation of knowledge from the laboratory to the bedside in a manner that improves the health of children and adults during this time of transition.

Stanford's history has been shaped by transitions. The Stanford University School of Medicine began in 1908 when the Cooper Medical College, located in San Francisco, became part of the University. Outstanding clinical training and practice characterized the first half of its history, during which time the School's clinical programs remained in San Francisco. In 1959 the School's clinical programs moved to Palo Alto, consolidating the basic and clinical sciences and, even more importantly, aligning the School of Medicine to Stanford University. During this period, the contributions by Stanford faculty in basic research and clinical medicine have been extraordinary and far ranging. From discoveries that shaped our knowledge of DNA synthesis, spawned the revolution in genetic engineering, contributed significantly to the sequencing of the human genome and discovered the gene chip and microarray, to the first heart transplant, first heart-lung transplant, first application of the linear accelerator and the first use of monoclonal

antibodies to treat human cancer, Stanford faculty have played a remarkable role in the creation and application of new knowledge to improve human health and well-being. Our mandate must be to continue this tradition of excellence and to provide a beacon of hope for the future of American medicine.

To help assure the stewardship for the School of Medicine, a comprehensive Strategic Planning process was initiated upon my arrival in April 2001. Recognizing the intricate interrelationships of our missions in education, research and patient care, our planning process was comprehensive and embraced medical and graduate student education as well as the training of postdoctoral scholars; basic and clinical research; patient care; the organization and structure of the professoriate to oversee our tripartite missions; the use of information resources and technology to shape our future programs; the role of finance and administrative services to support our programs; and the need for communication, advocacy, public policy to help engage the public trust and contribute to the philanthropic support for the School and its programs. The first phase of our efforts led to our comprehensive planning document ***Translating Discoveries***, which was published at the end of 2002 and which is available at <http://medstrategicplan.stanford.edu/>.

Of course developing a strategic plan is only useful if it is implemented. I am pleased to say that during the past eighteen months, we have made considerable progress in achieving many of our initial goals and objectives, some of which have been highlighted in my bi-weekly Dean's Newsletter, which is distributed to all members of the School of Medicine community and which is available on our Web Site (<http://deansnewsletter.stanford.edu/>).

Critical planning is essential for Stanford. Among the smallest of the research-intensive schools of medicine, Stanford must critically assess and prioritize its goals and objectives and apply its resources wisely and creatively. ***Translating Discoveries*** provides a partial road map, providing an overall strategic direction while still valuing the creative contributions that can chart new directions, emerging from the ideas and scholarship of our faculty, students and staff.

I envision that change will continue to unfold in both expected and unrecognized areas during the next several years. Among the changes we can predict now will be the initiation of our New Stanford Curriculum for medical student education. Thanks to the close collaboration of the Dean's Office with the School's Faculty Senate, the new curriculum has been built around several guiding goals, including:

- Identifying the core knowledge and skills required for all students to permit a path for lifetime learning. A concurrent goal is to limit the amount of course-work in order to permit time for individual scholarship and research.
- Balancing the curriculum by including both clinical and basic science experiences throughout medical school training in order to assure the essential integration of basic and clinical science.

- Developing required majors (“scholarly concentrations”) for all students to enhance independent research and scholarship capabilities

The scholarly concentrations (or majors) will take one of two forms: the Scholars Track (which can be done in four years) and the Original Research Track, which will require five or more years. For students beginning in the Fall of 2003, eight scholarly concentrations have been selected and will be available for entering students. These include Bioengineering; Bioethics and Medical Humanities; Biomedical Informatics; Health Services and Policy Research; Immunology; Molecular and Genetic Medicine; Public Service and Community Medicine; and Women’s Health. In addition to these Scholarly Concentrations, four others are in development that also closely align to student interests and include: Clinical Research, Infectious Diseases, International Health and Neuroscience. Finally, some students will also have the opportunity to devise an individual scholarly concentration if one does not exist that meets their own personal goals and direction.

As the New Stanford Curriculum unfolds over the next years, we envision that it will help create a new cadre of physician leaders. Our specific goal is to assure that our students not only receive outstanding clinical training but that they also acquire knowledge and skills that will permit them to help transform the face of medicine and science in the future.

In tandem with the curriculum changes that are underway for medical students, we are also placing a greater emphasis on the interdisciplinary education and research opportunities for our graduate students and postdoctoral fellows. These are themes that are very much consonant with one of the most exciting directions occurring in science and for which Stanford serves as a national leader.

In order to facilitate the training of the future, we are also deeply involved in the program planning for new facilities for the education of students, post-graduate trainees and faculty. When completed (we hope by 2008), the new Stanford Medicine Information and Learning Environment (SMILE) will offer state-of-the-art facilities for small and large group teaching, immersive learning and a knowledge center. SMILE will also create a bridge that links our medical and graduate students as well as our basic and clinical scientists and clinicians.

As noted, one of the most exciting developments at Stanford is the focus on interdisciplinary education and research. While many universities now recognize the excitement that exists at the intersection of traditional physical, biological and computational sciences, Stanford has a long history of engagement and participation in this arena. Indeed, collaboration across school boundaries is highly valued by Stanford faculty and supported by its leaders. The goal of becoming “one university” recalls the dreams of Stanford’s first president, David Starr Jordan, and bears witness to its current president, John Hennessy.

During the past year, the establishment of a new joint Department of Bioengineering between the Schools of Engineering and Medicine offers tangible evidence of a commitment to interdisciplinary education and research. The goal is to create a fusion of engineering and the life sciences that promotes scientific discovery and the development of new technologies and therapies through research and education. Through programs in graduate and undergraduate education (which we hope will commence in 2004 and 2005 respectively) it is our hope that this new department will permit us to better understand living systems; learn from these systems to improve engineering designs; engineer biological systems; and improve human and environmental health through research, education and therapy.

Interdisciplinary research and education will take on several additional forms at Stanford University during the coming years – each impacting the School of Medicine in one or more ways. Among the major multidisciplinary themes for the University will be the Performing Arts; Bioengineering; BioX and Translational Medicine; the Environment; and International Affairs. The School of Medicine's faculty and students map to each of these initiatives and for some, will serve as a leader.

As tangible evidence of our multidisciplinary commitment, the Clark Center will be completed in June 2003 and will represent a model for the future. Located on the Medical School campus, this new state-of-the-art facility will house 40 faculty from four schools, representing 24 departments. It will bring together faculty and students from the physical, biological, computational, engineering and environmental sciences. The goal is to create focal areas of investigation that facilitate new collaborations within the Clark Center but, even more importantly, that engage faculty in departments and schools throughout the University. Among the areas for initial focus within the Clark Center are:

- **Biocomputation**, including image processing, bioinformatics, protein folding, biomechanical simulation, remote teaching
- **Bioengineering**, including the administrative home for the new Joint Department of Bioengineering
- **Biodesign**, including biorobotics, biosensors, surgical techniques, medical devices, tissue repair, image guidance, therapeutic delivery systems
- **Imaging**, focusing on molecules, cells, tissues, movement
- **Biophysics** of single molecules
- **Chemical Biology**
- **Genomics/Proteomics**
- **Systems Neuroscience**
- **Regenerative Medicine**

School of Medicine faculty and students will play a major role in a number of these initiatives. Importantly, they will expose students to novel approaches to research and new opportunities for inquiry at the intersection of disciplines.

One of the major goals of the School of Medicine is to benefit from the knowledge emanating from basic science research to improve human health. *Translating*

Discoveries thus represents a unifying initiative for the School and its faculty. As is nearly always the case, the best research will result from the creative energy of investigators working in self-initiated collaborations. It is our hope that the environment at Stanford will foster novel collaborations and promote translational discoveries. In addition, we also plan to focus some overarching themes that link basic research with clinical care. Indeed, we believe that such linkages will help make Stanford Medical Center unique and will serve as the basis for judging its excellence and importance to our communities, locally and globally.

Based on our assessment of opportunities in science and technology and the expertise of our faculty, we plan to launch four interdepartmental and interdisciplinary efforts under the banner of the Stanford Institutes of Medicine. Each will provide an area of focus but it is also likely that they will offer opportunities for synergy between them. Equally important are the numerous opportunities for collaborations across the University related to the Stanford Institutes of Medicine.

The four Stanford Institutes of Medicine will be:

- The Stanford Institute of Cancer/Stem Cell Biology and Medicine
- The Stanford Institute for Cardiovascular Medicine
- The Stanford Institute of Neuroscience (aka Stanford Brain Research Institute)
- The Stanford Institute of Immunology, Transplantation and Infectious Diseases

As a School of Medicine and Medical Center, improving patient care is our ultimate mission. We currently benefit from faculty who are leaders in providing state-of-the-art patient care. We are also challenged, however, by being part of a very competitive and costly health care environment. Operating an academic medical center in the 21st century carries with it costs for education and research that are not completely funded and that require additional support from institutional resources or the community. Offering excellence in clinical care and patient services along with leading edge innovation and discovery is the key to Stanford's future success. Translational medicine is essential to this effort, as is a close partnership between our faculty and hospital leaders. Communicating effectively with our communities and engaging them in the support for Stanford Medicine is essential and addresses our goal of re-engaging the public trust in academic medicine.

I believe that Stanford Medicine is uniquely poised to play a major role in redefining the future of academic medicine. The challenges are many but the opportunities are extraordinary.

CCIS Summer Intern Program

Twenty-three stellar high-school students were selected from over 180 applicants to participate in an eight-week program of intensive research in the Center for

Clinical Immunology at Stanford (CCIS) Summer Research Program. Most students were from the San Francisco Bay area, and "all had much higher SATs (an average of nearly 1550) and grades than I had!" noted P.J. Utz, M.D., Director of the Program. Bench research was complemented by 16 lectures on basic immunology, scientific method, and career opportunities, as well as exposure to patients in the hospitals and clinics. The lecture course was modeled on the same immunology course taken by Stanford medical students, including a 300-page syllabus organized by Dr. Utz, Donna Thibault (course TA and a graduate student in the Utz lab), immunology graduate students, and Professor David Lewis. Almost all lectures were presented by immunology graduate students, contributing greatly to their training as future leaders in education. The program culminated in a two-hour poster session on August 7, attended by 200 members of the Stanford and local community. The program is funded by the National Institutes of Health, Howard Hughes Medical Institute, the Arthritis Foundation Northern California Chapter, and individual benefactors of CCIS. Congratulations to all involved, particularly CCIS Director, Garry Fathman, M.D., and the lab mentors and students for taking on the task of training the next generation of immunologists.

Community Lecture Series

On Wednesday, September 3rd at 7:00 p.m. in the Fairchild Auditorium, Drs. Alan Yeung, Bobby Robbins, Bruce Reitz, and Judy Swain, will present "Rejuvenating the Heart: Current Technologies and Future Promise."

Please join us to hear some of Stanford's top heart experts discuss innovative new approaches to diagnosing, treating, and preventing cardiovascular disease. This free event is the first of an ongoing series of lectures on important issues in health care and biomedical research.

If you have any questions, please call 650-234-0653.

Dean's Newsletter September 15, 2003

Welcome to Our New Graduate Students

Over the next several days our new graduate students will be arriving at Stanford. They will spend time getting acquainted with their new Stanford colleagues and will participate in the BIOMASS camping trip over next weekend. We will welcome them officially on Monday September 22nd. It is notable that not only do we have an outstanding group of entering graduate students this year but that they will number 100 women and men – making them the largest class to matriculate at the School of Medicine this academic year. We all look forward to having them join us.

Introduction to Scholarly Concentrations Begins for New Students

On Wednesday evening, September 3rd, introductions to incoming medical students about the opportunities offered within the new Scholarly Concentrations commenced. The plan is for them to learn about two Scholarly Concentrations at each of four review sessions. The September 3rd session featured presentations about course and research offerings in the “Immunology Concentration” and the “Bioethics and the Humanities Concentration”. On September 10th students learned about the “Health Policy Research Concentration” and the “Bioinformatics Concentration”. Recognizing that these programs are just getting underway, I was impressed with the excellent opportunities for scholarship and research in each of the areas presented to date. Each of the Scholarly Concentration Directors provided information about the course work that would accompany their specific area of inquiry. In a number of instances new courses have already been developed that are specific to the new concentration. Further, the opportunities for investigative or original research abound in each of these areas. I have also been pleased to note the considerable enthusiasm of our new students as they become partners in helping to further refine the New Stanford Curriculum over the years ahead. (See also <http://www.stanford.edu/dept/news/report/news/2003/september10/curriculum.html>).

It was just two years ago that we first began evaluating the curriculum and considering a process for change. Since then, considerable progress has been made in developing the conceptual framework and basic elements of the New Stanford Curriculum, of which the new Scholarly Concentrations are a unique and exciting component. This has been founded on the fundamental premise that we want our students to leave Stanford with the tools to permit them to transform the future of medicine. Whether their contributions will be in research, patient care, education, community service or other areas of medicine and science, our students should be equipped with the additional skills to propel their interests and deepen their knowledge. Our ultimate goal is that each student will be a committed leader, benefiting from the array of opportunities that abound in the School of Medicine in tandem with the expertise that lies throughout Stanford University.

The process of curriculum reform will be ongoing. During the past year, the focus has been on the general framework and the specifics of the first year. Over the months ahead, the Dean’s Office and Faculty Senate will work collaboratively to further refine the first and second year curriculum. Coupled with this will be the continued integration of basic and clinical science throughout the years, including basic science mini-courses during clinical rotations.

It should not go unnoticed that curriculum change is central to the vitality of a professional school. It should nearly always be a work-in-progress. That said, the dimensions of the changes that are occurring at Stanford are quite significant and many have been accomplished on a remarkably short timeline. I want to thank again the many students, course leaders, faculty and staff who have worked so hard to make this happen. I also want to thank again Drs. Julie Parsonnet, Neil Gesundheit, Oscar Salvatierra, Ted Sectish and Ms. Betsy Porter for the enormous amount of effort they put into making the New Stanford Curriculum come alive this academic year.

Update from the Executive Committee: Plans to Assess Faculty Research and Clinical Affinities

During the past two years, we have invested considerable energy in developing and implementing the School's Strategic Plan *Translating Discoveries* (<http://medstrategicplan.stanford.edu>). In doing so we have worked hard to embrace input from faculty, students and staff throughout the School of Medicine. I have also provided regular updates on our progress in implementing the Plan – both in written communications like the Dean's Newsletter as well as departmental, town hall or less formal faculty or student meetings. Obviously one of my major goals is to do everything possible to communicate our plans and challenges to the medical school community – and hopefully to get feedback from you.

As we now begin planning for our third Leadership Retreat that will be held on January 28-31, 2004, it seems appropriate to assess how aligned and engaged our faculty are with our various interdisciplinary initiatives and equally importantly, to get insights from them about additional or new potential research and clinical opportunities we should consider for the future.

Accordingly, at the September 5th Executive Committee, we discussed our plans to conduct a web-based simple survey of all of our faculty that will hopefully shed light on their affinity with programs we have already identified (e.g., the Stanford Institutes of Medicine) as well as to identify new areas of opportunity they believe should be pursued at the School.

We will be contacting you in the next couple of weeks to complete this survey – which will be short and simple to do. We are hoping to hear from everyone. Please look for it when it comes and complete it. I am very interested in your response and input.

Update Regarding University Interdisciplinary Research Planning

Interdisciplinary research and education are permeating throughout Stanford. They will also be the theme of several University-wide initiatives that are currently being planned or initiated and featured prominently the discussion of the Executive Cabinet meeting that was held on Monday September 8th. Among these will be Stanford as an International University; the Arts; Energy and the Environment; and Bioengineering/BioX. The school has a role in each of these areas, especially the Bioengineering/BioX initiatives. These also feature prominently in the School of Medicine interdisciplinary efforts in education (such as our New Stanford Curriculum) and in our new Stanford Institutes of Medicine. Updates on these evolving themes will be featured in future Newsletters.

Stethoscope Dinner for New Medical Students

On Friday evening September 5th, we held the annual Stethoscope Ceremony for the Entering Class of 2003 (including four students transferring into upper classes). The Stanford Medical Alumni Association and the School of Medicine sponsor this very special event. Our new students, family and friends gathered for an evening of fun and

festivity in the Faculty Club where they learned more about each other, heard offerings from Dr. Ross Bright, Associate Dean for Alumni Affairs, Linda Clever, President of the Stanford Medical Alumni Association, Julie Parsonnet, Senior Associate Dean for Medical Education and me. Students also received advice on how to cope with the years in medical School from Ben Bruce, SMS 3 and President, Stanford Medical Student Association. His talk entitled "*Things You Thought You Would Never Hear at A Stethoscope Ceremony At A Medical School*" was very well received.

The heart of the event is the handing out of stethoscopes to each of the new students. This takes the place of the traditional "white coat" ceremony held at most medical schools and, in my opinion, is more meaningful since the stethoscope not only serves as a tool and symbol in medicine, but equally importantly connects the physician to her or his patient – creating that important human connection.

Launch of the Community Lecture Series

Thanks to the inspiration of Senior Associate Deans for Research, Graduate and Postdoctoral Education John Boothroyd and Harry Greenberg and the support of the Office of Medical Development, the School launched the first of its yearlong Community Lecture Series. Each department within the School will host sessions throughout the year. The lead off event was coordinated by the Departments of Medicine and Cardio-thoracic Surgery and was entitled "Rejuvenating the Heart: Current Technologies and Future Promise." Drs. Bruce Reitz, Bobby Robbins, Paul Wang, Alan Yeung and Judy Swain each spoke to a nearly filled Fairchild Auditorium of our neighboring communities about advances in the treatment of heart disease and heart failure, much of which has been pioneered at Stanford.

The next lecture will be held on October 1st at 7:00 p.m. in the Fairchild Auditorium. Drs. Linda Shortliffe, Joseph C. Presti, Jr., James D. Brooks, and Thomas Hsu will present: "Everyone Needs A Urologist: Problems of Incontinence, Stones, Cancer, Fertility, and Development."

Continuing Medical Education in Clinical Immunology

On Saturday, September 6th, the Federation of Clinical Immunology Societies (FOCIS) Center for Clinical Immunology at Stanford (CCIS) and the UCSF Center for Clinical Immunology joined together to sponsor a continuing medical education symposium. It was also an opportunity to describe the accomplishments of FOCIS in establishing centers of excellence throughout the world that "intensify and accelerate local multidisciplinary scientific innovation in research, education and patient care." Stanford's CCIS, led by Dr. Gary Fathman, Professor of Medicine (Immunology and Rheumatology) is one of twenty-two FOCIS Centers.

At Stanford, the Center for Clinical Immunology has as its mission, "to educate physicians and trainees and the public in order to bring discoveries in basic science to medical disciplines ranging from cancer to diabetes and from arthritis to infectious disease, bridging the spectrum of research from the genetic and molecular level to clinical trials, sharing information and resources in order to speed the transition of new therapies

from the laboratory to the patient's bedside." Over the years the CCIS has played an important role in education of students from high school to the postdoctoral level and in research and clinical care. Much of this has been through the leadership of Gary Fathman and his colleagues.

Importantly, the CCIS fits very nicely into the broader agenda of the School of Medicine, including our focus on "translating discoveries." Further, the CCIS will play an integral role in one of our Stanford Institutes of Medicine – the Institute for Immunology, Transplantation and Infection.

Help Needed for the Pacific Free Clinic

I have been asked by some of our medical students to let you know that students and faculty physicians are needed to volunteer their time at a new clinic being operated by students from the School of Medicine. The Pacific Free Clinic provides basic health-care services to low-income adults in Santa Clara County. It is open on Saturdays from 10 a.m. to 2 p.m. at Overfelt High School, 1835 Cunningham Road in San Jose.

Like the Arbor Free Clinic, which Stanford medical students have operated in Menlo Park for the past 13 years, the Pacific Free Clinic offers primary care services, medications, laboratory tests, medical and insurance referrals and screenings for diabetes, high blood pressure and elevated cholesterol. All services are free, and interpreters are available to assist patients who speak Spanish, Vietnamese and Mandarin Chinese. Medical students, undergraduates and volunteer physicians from Stanford and the community, will staff the clinic. While students will run the clinic and take medical histories, physicians will perform the actual exams and diagnose the patients.

Although the idea for the clinic surfaced a few years ago, the project gained momentum last summer when The Health Trust, a foundation dedicated to improving the well-being of Santa Clara County residents, offered Pacific Free Clinic the use of its facilities at Overfelt High School. The site, located between predominantly Latino and Vietnamese communities, is an ideal location for serving immigrant patients.

The clinic is also currently recruiting students who speak Spanish, Vietnamese or Mandarin Chinese, as well as physicians. If you are interested in volunteering please contact David Wang at davidwang@stanford.edu. Additional information about the clinic is also available on the Internet at <http://pacific.stanford.edu>.

The Pacific Free Clinic is jointly sponsored by the Stanford School of Medicine and the School-Based Health Clinics of The Health Trust, soon to be known as School Health Clinics of Santa Clara County. Other supporters include the California HealthCare Foundation, Kaiser Permanente, Chanwell Medical Group and private donors.

Awards

- **Dr. David K. Stevenson**, Senior Associate Dean for Academic Affairs and the Harold K. Faber Professor of Pediatrics and Professor, by courtesy of Obstetrics

and Gynecology received "The Duane Alexander Award for Academic Leadership in Perinatal Medicine which is presented annually to a distinguished academic leader who has enhanced the education of young clinician and scientists". The Award was presented at the annual NICHD/University of Colorado Aspen Conference on Maternal-Fetal-Neonatal-Reproductive Medicine in August 2003.

Announcements

Dean's SPIRIT Award

The School of Medicine's third annual SPIRIT Award Program will take place during the fall of 2003. This award acknowledges two staff members - one exempt and one nonexempt - who have been selected for providing outstanding contributions to the mission and vision of the School of Medicine. Dean Pizzo will award each of the two selected staff members with a \$1,000 cash prize and an "A" parking sticker for the coming year at the School's Annual Staff Recognition Banquet in November.

Any faculty, staff, student, fellow and post doc working at the School of Medicine may nominate any eligible staff members (i.e., non-exempt, bargaining unit and exempt) in any department or administrative area who meet the award criteria:

S - service-orientation
P - positive attitude
I - initiative
R - resourcefulness/reliability
I - innovation
T - team player

Staff members must have been employed as regular employees, at 50% FTE or more, in one department/unit for the past 2 years.

Ballots are due by Friday, October 3, 2003. Ballots may be obtained from department administrators or the Directors of Finance and Administration (DFA) web site:

<http://www.med.stanford.edu/school/dfa/>.

Please send ballots to:

Spirit Award Selection Committee
c/o Human Resources Group
Medical School Office Building
Mail Code 5460

Recipients will be selected and notified at the beginning of November.

Appointments and Promotions

- **John Barry** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences and Associate Professor, by courtesy, of Neurology and Neurological Sciences, effective 9/1/2003 to 8/31/2008.
- **Donna Bouley** has been promoted to Associate Professor of Comparative Medicine and, by courtesy, of Pathology at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2008.
- **Susan Brundage** has been appointed to Associate Professor of Surgery at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2008.
- **Loretta Chou** has been promoted to Associate Professor of Orthopedic Surgery at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2008.
- **Gregory Enns** has been reappointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 10/1/2003 to 9/30/2007.
- **David Fiorentino** has been appointed to Assistant Professor of Dermatology at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2006.
- **Michael Fredericson** has been promoted to Associate Professor of Orthopedic Surgery at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2008.
- **Leland Hanowell** has been appointed to Associate Professor of Anesthesia at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2008.
- **Stuart Kim** has been appointed to Professor of Developmental Biology, effective 9/1/2003.
- **David Kingsley** has been appointed to Professor of Developmental Biology, effective 9/1/2003.
- **Amy Ladd** has been promoted to Professor of Orthopedic Surgery at the Stanford University Medical Center and at the Palo Alto Veterans Affairs Health Care System, effective 9/1/2003.
- **Jongsoo Park** has been appointed to Assistant Professor of Neurosurgery at the Stanford University Medical Center and at the Lucile Salter Packard Children's Hospital, effective 9/1/2003 to 8/31/2006.
- **Lawrence Recht** has been appointed to Professor of Neurology and Neurological Sciences and Professor, by courtesy, of Neurosurgery at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2008.
- **Iris Schrijver** has been appointed to Assistant Professor of Pathology and, by courtesy, of Pediatrics at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2006.
- **Sandhya Srinivas** has been reappointed to Assistant Professor of Medicine (Oncology) at the Stanford University Medical Center, effective 9/1/2003 to 8/31/2006.

Dean's Newsletter

September 29, 2003

Welcoming our New Graduate Students

On Monday, September 22nd, our incoming class of graduate students had their official welcoming to Stanford. I want to thank Gilbert Martinez for all his work helping to coordinate the orientation of our new students. The tag line in Gilbert's email address affirms his commitment and reads, "No progressive change has ever occurred anywhere in the world without the energy and inspiration of young people." I certainly agree.

This year's orientation included valuable advice by Lucy Sun on Living in Palo Alto (not too difficult of course), an overview of "Making the most of your education" by ChaRandle Jordan; "The important issues surrounding finding faculty, choosing a lab and advisor – and staying focused" by Rebecca Ihrle; and finally, 'Social life at Stanford' by Garret Heffner.

On Tuesday evening a lovely dinner for our new graduate students was held in the Arrillaga Alumni Center. In addition to providing the opportunity for our new students to meet each other and interact with faculty, they also heard helpful presentations by Professors Ellen Porzig, Tim Stearns and John Boothroyd on how to succeed as a graduate student and, equally importantly, how to take advantage of the unique and special resources that Stanford offers in biomedical research.

Important: Please Complete Your Faculty Alignment Survey

Last week I sent a short survey to all full-time faculty regarding their alignment with the various interdisciplinary research or clinical programs that have been formed within the School, Medical Center or University. The survey also asked faculty to indicate research or clinical opportunities that they felt the School should consider addressing during the next several years. It is important that we hear from each of our faculty. If you have not yet filled out the survey, please do so now by going to <https://med-intranet.stanford.edu/faculty-survey/>. I would very much appreciate your taking the time to complete this survey as soon as possible – but absolutely no later than October 10th.

Executive Committee: Update on the Department of Surgery

At the Executive Committee meeting on Friday, September 19th, Dr. Tom Krummel, Emile F. Holman Professor and Chair, Department of Surgery, gave an update on the excellent progress being made in the various missions of the department over the past five years. He began by noting that the Department of Surgery was founded in 1925 when the School was in San Francisco. However, when the School moved to Palo Alto, most of the department's faculty (the then young Dr. Norm Shumway being a notable exception) remained behind and the department faced some challenging times. A bright spot was during the leadership of Dr. Robert Chase but other periods featured rapid chair turnover and lots of significant challenges. In fact, in 1998, when Dr. Krummel became

chair, the department was in the unenviable position of having a \$5M clinical deficit and to make matters worse, ranked 30th in the nation in research and had a poorly rated clinical clerkship and a residency program that was on probation. Five years later, in 2003, thanks to the leadership of Dr. Krummel and the work of his colleagues, the department achieved a positive clinical financial performance (for the first time in many years), ranked 9th in the nation in research, had a highly rated clinical clerkship and a top 10% rated residency program. Clearly significant progress during very challenging times!

According to Dr. Krummel, one of the key factors contributing to the department's move toward success has been the recruitment of new faculty. In fact, during this five year period, some 37 new clinical and research faculty have been recruited, many bringing important new areas of expertise and specialization. Given that the current department has 71 full-time faculty, these new recruitments clearly represent a major shift for the department.

Dr. Krummel highlighted the changes that have occurred by division, and I will summarize them briefly here:

- **Anatomy** currently has four faculty and is responsible for the school's education programs in anatomy as well as device design testing.
- **Emergency Medicine** has eight faculty and covers both the adult and pediatric emergency programs, currently numbering 38-40,000 visits/year. The faculty are also responsible for staffing the Level I Trauma Center and for supporting the Life Flight Transport (which includes approximately 600 flights/year). The Emergency Medicine program also hosts a highly sought after and highly rated residency program. They suffer however from constrained and antiquated facilities and from the inadequate separation between pediatric and adult care facilities – issues that will hopefully be addressed as part of the Hospital's future facilities plan.
- **General Surgery** is currently comprised of 20 faculty (12 of whom have joined the department in the past five years) with new programs in colorectal surgery, minimal access surgery, surgical oncology and trauma/clinical care. In addition to the program at SHC, there is also a highly rated unit at the Palo Alto VA Hospital. Within a short time, progress has been made in several areas:
 - The Colorectal program, under the guidance of Drs. Mark Welton and Andrew Shelton (both recently recruited from UCSF) has become a referral center for Northern California, Oregon and Nevada and has assumed leadership on a national level as well.
 - Surgical Oncology will benefit from the new leadership of Dr. Jeff Norton (who joined the Department from UCSF). Also excellent collaborations have been established with the microarray facility and the clinical programs in breast and liver cancer.
 - The Trauma Program has grown from virtually non-existent three years ago to one now seeing >1500 patients/year and has achieved full accreditation from the ACS as a Level I Trauma Center thanks to the leadership of Dr. David Spain.

- **Otolaryngology – Head and Neck Surgery** is undergoing evolution with the recent recruitment of Dr. Rob Jackler with new programs in otology, laryngology, skull base surgery, audiology and cochlear implants.
- **Pediatric Surgery** also has new leadership with the recruitment of Dr. Craig Albanese, an internationally recognized leader in minimal access surgery as well as fetal diagnosis and treatment. It is expected that these programs will grow during the years ahead along with other surgical subspecialties at LPCH.
- **Plastic and Reconstructive Leadership** also has new leadership with the appointment of Dr. R. Vincent Hentz as chief and this program is already recognized as one of the top five residency programs in the nation. With the recruitment of Dr. Michael Longaker, an outstanding research program in tissue engineering and repair has been established as well.
- **Solid Organ Transplantation** is a very strong program under the leadership of Dr. Carlos Esquivel, one of the world's most premier liver transplant surgeons. This program boasts among the very best outcomes in kidney and liver transplantation, has been a pioneer in living donor liver transplantation and has made major contributions to reducing the need for steroids in the post-transplant immunosuppressive regimen.
- **Vascular Surgery** has one of the top fellowship programs in the nation as well as a highly rated residency program. This division has a long history of pioneering work in device development – initially with Dr. Tom Fogarty and more recently with Chris Zarins. We are currently working with the department and division to form a Vascular Center at Stanford that will be a cooperative venture between the departments of surgery, radiology, medicine and cardiothoracic surgery.

While the department has made considerable progress during the past several years, it continues to face a number of challenges. These are related in part to the continued and very constrained health care funding environment. In addition, nationally surgery has faced some workforce pipeline issues largely due to the difficulty of attracting women (who as you know now comprise >50% of medical school graduates) to this specialty. With the efforts of Dr. Krummel and his colleagues, the Stanford department appears to be faring better and has, during the past several years, attracted both excellent women faculty and residents, ranking now well above the national average. It is hoped that by establishing a critical mass of successful female surgical role models – a process now well underway at Stanford.

The department also faces challenges in developing excellence in research but has also demonstrated progress in this arena as well. NIH funding is up significantly during the past several years and outstanding programs in haptics/robotics/simulation technology/virtual reality for education and training along with excellent programs in vascular flow modeling and device development as well as tissue engineering and regenerative medicine.

The presentation by Dr. Krummel made clear that considerable progress has been made in the department's missions in patient care, education and research. I want to thank him

for his leadership and express our appreciation to the faculty, students and staff for their many contributions.

Medicine for the 21st Century

On Tuesday evening, September 16th we held a community forum entitled “The Future is Now: 21st Century Medical Education” at the Arrillaga Alumni Conference Center. The goal of the forum was to demonstrate how medical education is changing as a consequence of new technologies and the instrumental role that Stanford is playing in helping to lead this change.

The conference began with a film entitled “The Future is Now” prepared by SUMMIT and featuring the role of the “interactive simulated patient” in medical student education, a project supported by the Wallenberg Foundation, in which student practices virtually all aspects of the patient encounter (history, physical examination, laboratory studies, etc.) to formulate a diagnosis and management plan. The examples used in this video were made possible by Ms. Jean Stringer, Associate Director of Learning Technologies in the Office of Information Resources and Technology along with Mr. Kingsley Willis, a Stanford Graduate Student and Mr. Oscar Otanez (SMS 3) who also participated in the video as an actor.

Following the video presentation I reviewed medical education in the United States during the 19th and 20th Centuries as a context of understanding its evolution in the 21st Century. The vast array of new knowledge coupled with the rapidly changing information technologies (including simulation, virtual reality, etc.) present a very different set of opportunities for the future. Stanford has been a pacesetter in this area and the opportunities unfolding through the New Stanford Curriculum and the plans for the Stanford Medicine Information and Learning Environment (SMILE) put us in a position to truly influence the direction of medical education for the 21st Century. One of the important goals of course is to couple the best of the new technologies with the best principles of the “practice of medicine” including compassion, sensitivity and the human touch factor that helps define the doctor-patient relationship. Thankfully, the approaches planned for SMILE and the New Stanford Curriculum will make these goals aligned – to the benefit of our students and their future patients.

The evening featured small group discussions lead by faculty leaders on key topics including:

- ***Surgical Simulation*** by Dr. Tom Krummel, Professor and Chair of the Department of Surgery
- ***Internet-Based Medicine*** by Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology
- ***New Medical School Facilities: Catalysts for Innovation*** by Ms. Maggie Saunders, Program Planning Director for SMILE
- ***Translational Medicine*** by Dr. Paul Berg, Cahill Professor of Biochemistry, Emeritus and Special Advisor to the Dean

- ***Unique Student Research Projects*** by Dr. Julie Parsonnet, Senior Associate Dean for Medical Education. This section featured presentations by Ted Leng SMS V who is working with a team from the Department of Ophthalmology and the School of Engineering on the development of an artificial retina and Pam Mosher who is working with Dr. Lou Halamek from the Department of Pediatrics, on the use of simulation technology and the standardized patients to help educate medical students on how to approach the very challenging issue of death and dying.

The event was highly successful in conveying our excitement about the future of medical education and the very important role that Stanford will play in its future evolution.

Leadership Changes in the Department of Health Research and Policy

I would like to begin by thanking Dr. Mark Hlatky who has served admirably and with distinction as the Chair of the Department of Health Research and Policy for the past seven years. During this time he has played an important role for the department as a leader as well as a highly productive faculty member and has also served the School through his leadership on the Reynolds Foundation Grant. Recently, Dr. Hlatky has indicated to me his interest in focusing more of his energies on research and education rather than administration and his desire to step down as Chair.

Accordingly, I am also pleased to announce that Dr. Rob Tibshirani has agreed to assume the responsibilities of Chair of HRP from Mark Hlatky beginning October 1st. He will be joined by Dr. Alice Whittemore who will serve as Associate Chair.

During the next several months we will continue the process initiated within HRP regarding the overall organization and structure of the department. Recognizing the important role that it plays in the School of Medicine, it is important to use this time to ask critical questions about the best way to optimize its composition for the future. I will let you know the outcome of these deliberations as they develop in the months ahead.

Lucile Packard Children's Hospital Provides Gift to Support a Biotechnology Core

On Friday, September 26th, Dr. Alan Krensky, Director of the Children's Health Initiative and Shelagh Galligan Professor of Pediatrics, announced at Pediatric Grand Rounds that the Lucile Packard Children's Hospital has given \$700,000 to the Stanford University School of Medicine to harness the rapidly evolving field of biotechnology research for advancing children's health. The gift will create a center that will allow basic scientists and clinicians to use the tools of biotechnology -- genetics, genomics and proteomics -- to create ways to diagnose childhood diseases earlier, predict which children will respond to treatment and determine which children will have serious side effects from therapies.

To help initiate this effort, the hospital and School of Medicine have recruited James W. Schilling, Ph.D., to serve as senior scientist and director of the Children's Biotechnology

Core, a joint hospital and medical school appointment. Shilling comes from Sugen, Inc., now Pfizer, where he has served as principal scientist and director of protein chemistry.

We very much appreciate the vision and support of LPCH and its President & CEO, Mr. Chris Dawes, in bringing this exciting new initiative to fruition. It represents an exciting partnership between the School and LPCH to advance knowledge that will help to improve the health of children – and likely adults as well.

Briefing on the Stanford Institute for Cancer/Stem Cell Biology and Medicine

On Monday morning September 22nd, we held another in our series of briefings about the Stanford Institute for Cancer/Stem Cell Biology and Medicine. This highly successful event offered the opportunity to provide an update to community leaders on our key initiatives now underway in cancer and stem cell biology research as well as a glimpse about how these programs will evolve during the next several years under the aegis of the Stanford Institute for Cancer/Stem Cell Biology and Medicine. Program speakers included myself as well as Dr. Robert Negrin, Associate Professor of Medicine and Director of the Bone Marrow Transplant Service, and Dr. Irv Weissman, Karel and Avice Beekhuis Professor of Cancer Biology and Director of the Institute. As I have discussed in prior Newsletters, the Institute for Cancer/Stem Cell Biology is one of four new Institutes that we are forming at Stanford, the other three being the Institutes for Neuroscience; Cardiovascular Medicine; and Immunity, Transplantation and Infection. Key to each of these new Institutes is the connection between research and clinical care via bi-directional translational research. One of the major goals of the Institute of Cancer/Stem Cell Biology and Medicine will be to further benefit from the already superb programs at Stanford in cancer biology by seeking alignment with clinical programs and to further enhance clinical programs, especially in solid tumors. Success in these areas will be key to our planned application to the National Cancer Institute for designation as a Comprehensive Cancer Center, the application for which will be submitted in October 2004.

Important to the further development of the Institute for Cancer/Stem Cell Biology and Medicine will be the successful recruitments of the Associate Director for Research and the Medical Director of the Clinical Cancer Center. Both of these positions are now under active research and it is our hope to find successful candidates within the next several months.

Stanford Hospital & Clinics Program “Breakthrough Collaborative on Operational Excellence”

On Wednesday, September 24th, SHC sponsored a forum on operational excellence for hospital and clinic managers and physician leaders. It is all too apparent that patient consumers and health care payers (both private and public) believe that the quality of the service being delivered is as important as the quality of care in selecting health care providers. The availability of service and ease of navigating ambulatory clinics or hospital environments impacts considerably on where patients choose to receive their

care, where physicians refer their patients and, in the future, how payers will determine contracts and payments. Improved clinical service coupled with active efforts to reduce medical errors has become a major feature of many clinical practices and academic medical centers. Even if the quality of patient care is outstanding (as is nearly always the case at Stanford) inadequacies in service, both real and perceived, can diminish the patient's experience and erode confidence in the overall clinical environment.

With the goal of aligning SHC with the School of Medicine, the "Collaborative" was initiated based on the considerable experience already gained and reported from the work of Institute for Health Care Improvement lead by Dr. Don Berwick (whom I know and have high regard for as both a former co-trainee and colleague). The major goals of the collaborative will be to:

- Improve the patient's experience of care at SHC by improving access to the clinics and by decreasing the patient's wait-times and delays in the clinic.
- Improve physician and staff satisfaction with their work in the clinics
- Create change leaders who can drive operational excellence.

During the past two years success in achieving such goals have been piloted and accomplished in the primary care clinic as well as the gynecology and gastroenterology clinics. The goal now is to further operationalize these and other improvements throughout the hospital and clinics. The steps involved in achieving performance excellence are well delineated and achievable. However they require commitment, focus and leadership by physician leaders and staff. Accomplishing these objectives is enormously important. Martha Marsh, President and CEO of SHC, and I, as Dean, are in agreement that this collaborative and the improvements they will bring are essential for both the Hospital and Clinics as well as the School of Medicine.

Special thanks to Drs. Jerry Shefrin, Joe Hopkins and Ms. Sandy Rozmarin for their efforts in bringing this program forward.

Project to Implement a New Public Web Site for the School

Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, asked to let you know that the school is about to embark on a large scale project to redesign and restructure our public Web presence. As a major communication medium, the Web plays a critical role in presenting the school to the public. Indeed, the School's Web site is often the first point of contact for individuals and is vital for sharing information and forming impressions. However, our current Web presence, taken as a whole, has not been redesigned for many years and overall does not appropriately reflect the current strategic directions of the School. Accordingly, the major goal of the redesign effort is to present the school and its missions in an attractive and comprehensive manner, to make information easier to find, to unify the many disparate Web sites in the school, and to provide easier methods for building and maintaining web pages.

During the past year, the School's Office of Information Resources and Technology (IRT) has been working with many groups in the school to develop a design that can serve as a common platform for presenting information about our departments, institutes, divisions and interdisciplinary programs. Recognizing that many groups have expended considerable effort to create existing individual sites, the design is intentionally flexible so that it can properly meet the needs of each unit while presenting the School as a unified entity with common guiding missions. In the coming months, we will launch a new home page for the school and overview pages for education, research, patient care, and community. Over the next two years, IRT will work with each of the departments, institutes, and IDP's to collaboratively redesign web sites using a common framework. As each of these sites is launched IRT will provide ongoing training, tools, and support for content authors to ease the process of maintaining departmental web sites in the future.

A prototype of the new design will be made available soon. We had the opportunity to review the prototype and plans at the September 19th Executive Committee where it received an enthusiastic endorsement from our clinical and basic science chairs. If you have questions about the redesign project, or would like to discuss how the new design relates to your existing departmental web site please contact Michael Halaas (michael@med.stanford.edu).

New Videoconferencing Service for School of Medicine

I am pleased to report that the Office of Information Resources and Technology (IRT) has installed a new videoconferencing facility in MSOB X348. This conferencing service runs on the Polycom platform. It has both ISDN conferencing capability and IP conferencing capability. On the ISDN side, the system supports a total bandwidth of 384 Kilobits per second, which yields good video resolution. Laptops can be attached to the system to present slide shows using Microsoft's PowerPoint application. The conference room will accommodate 20 people. For training and technical assistance in using this system please contact Bindu Madhava at 650-724-3371 or e-mail at madhava@stanford.edu. To schedule the Video Conferencing Facility in MSOB X348, please email X348-conference@med.stanford.edu or call 725-1233.

Lucile Packard Children's Hospital Leadership Forum

On Monday, September 15th, a Leadership Forum was held for members of the Lucile Packard Children's Hospital community in the Arrillaga Alumni Center. Chaired by Chris Dawes, CEO and President of LPCH, the forum addressed four major themes currently impacting the future of the hospital: financial sustainability, community satisfaction, patient satisfaction and space challenges. Discussions about these important topics were guided by data driven presentations and updates by Dr. Ken Cox, Senior Associate Dean for Obstetric and Pediatric Clinical Affairs and Ms. Sue Flanagan, Chief Operating Officer, LPCH. There was a very honest and candid discussion of the current challenges and limitations facing the hospital coupled with a discourse on how to improve or overcome them. In addition, Marissa Peterson, Executive Vice President,

Worldwide Operations and Chief Customer Advocate of Sun Microsystems, gave a keynote address on “Consumer-Centered Excellence.” Ms. Peterson is also a member of the Board of Directors of LPCH.

This Leadership is part of an ongoing series at LPCH and offers a very helpful way to secure a dialogue between faculty and staff about important issues. Future sessions will also tie these important issues to the academic challenges and opportunities facing the hospital and the Medical Center.

Agenda for the 2003-2004 Medical School Faculty Senate

Anticipating the agenda for the next session of the Medical School Faculty Senate, the Committee of Five met on Tuesday, September 16th. Foremost on the agenda will be continued focus on the New Stanford Curriculum addressing what has been achieved but also the enormous amount that remains to be done, especially with regard to the clinical rotations and their integration with the basic sciences. Equally important is the delineation of metrics to assess the impact of the changes that are being made with the New Stanford Curriculum on our students and school. Clearly the careful evaluation of our new undertakings is essential – and will feature prominently in future reports in the Newsletter.

Department Visits

Over the past several weeks, I have begun my annual meetings with individual departments by attending one of their regularly scheduled faculty meetings. This is an attempt to better understand the issues facing clinical and basic science departments –and also to meet with faculty. During the past weeks, I have had the opportunity to visit with the faculty in the Departments of Biochemistry, Dermatology, Structural Biology and Urology. Over the months ahead I hope to have the opportunity to visit each department.

I also will continue to hold informal lunches on a regular basis with small groups of faculty, the sole purpose of which is to meet with faculty and address issues or concerns relevant to them. I hope you will sign-up for one of these lunches as the dates become announced.

Announcements

- US Poet Laureate to Visit the School of Medicine on November 12th: On Wednesday, November 12th a Poetry Reading by Billy Collins, US Poet Laureate will be held at Noon in the Fairchild Auditorium. This is made possible by a generous gift from Helen and Peter Bing and is sponsored by the Arts and Humanities Medical Scholars Program and the Biomedical Ethics and Medical Humanities Scholarly Concentration. I particularly want to acknowledge Dr.

- Audrey Shafer, Associate Professor of Anesthesiology, for making this important presentation possible. I hope you will attend.
- Fall Forum on Community Health and Public Service: On Wednesday October 14th, the Fall Forum on Community Health and Public Service will be held in the Bechtel Conference Center (100 Encina Hall) from 5-7:30 PM and will feature poster and oral presentations being done by our Stanford Medical Students and their community partners. In addition, there will be a keynote address by Dr. Steven Schroeder, former CEO of the Robert Wood Johnson Foundation and currently the Distinguished Professor of Health and Health Care, Department of Medicine, UCSF. I hope you will mark your calendars and make every effort to attend. Please RSVP at stanfordfallforum@yahoo.com by September 19th, 2003.

Awards and Honors

- Two members of our Department of Biochemistry will receive important awards from the American Society of Biochemistry and Molecular Biology:
 - Dr. Ron Davis, Professor of Biochemistry, will receive the Lifetime Achievement Award from the Yeast Research Community at the Yeast Genetics and Molecular Biology meeting to be held next July, 2004, as well as the Herbert A. Sober Award.
 - Dr. Per Harbury will receive the Schering –Plough Research Institute Award of the American Society for Biochemistry and Molecular Biology.
- Dr. David Stevenson, Harold K. Faber Professor of Pediatrics and Obstetrics and Gynecology and Senior Associate Dean for Academic Affairs, has been accepted to the Board of Directors of the American Board of Pediatrics beginning in January 2004.

Congratulations to all.

Dean's Newsletter October 13, 2003

Update on the Professoriate: Billets and Caps Without Gowns

By virtually any measure, Stanford University School of Medicine stands out as a unique and special institution. As a research-intensive school of medicine, it excels in its tripartite missions of education, research and patient care. One of the most unique things about our school is its contiguous location to its major teaching hospitals as well as its proximity to Schools of Engineering, Humanities & Sciences, Business, Law, Education and Earth Science. This provides a unique setting for conducting interdisciplinary research and education – well evidenced by our important collaborations in Bioengineering, Bio-X, Translational Medicine as well as fostering our New Stanford Curriculum for Medical Education.

Stanford is also unique by having schools that are of outstanding quality but that are much smaller than those of peer institutions. This is also true for the School of Medicine, which is one of the smallest among the research-intensive medical schools in the nation. Ironically, while we are small in relation to our peer-medical schools, we appear large compared to the rest of university. Moreover, achieving balance within the university is important to our Stanford University colleagues and also fosters much of the interdisciplinary research and education that will make Stanford even more unique as we begin the 21st Century.

During the past decade, the numbers of faculty in all of the Schools at Stanford have remained relatively flat except for Medicine. In fact, every other school has a billet cap from the university that defines the number of new faculty that it can have at any point in time. During that same time period, however, the number of faculty in the School of Medicine have more than doubled, albeit for very good reasons. With the increased responsibility for clinical care at Stanford Hospital & Clinics as well as the Lucile Packard Children's Hospital, along with the greater complexity of clinical problems being encountered, and the increased use of advanced technologies, additional expertise has been essential in our clinical faculty. Indeed, this was the basis for creating the Medical Center Line (MCL) faculty in 1989. Since then, the MCL faculty has grown from 18 in 1991 to approximately 347 in 2003. Importantly, during this same period, the scope of responsibilities of the MCL faculty also changed – as was reviewed in the revisions of the professoriate that were carried out as part of the School's Strategic Plan "*Translating Discoveries*" (<http://medstrategicplan.stanford.edu/>).

One of the most important recent accomplishments was achieving approval from the University Senate in January, 2003 for Principal Investigator (PI) status for our MCL faculty. This helped to diminish the perceptions that MCL were less valued in the School and University. But it also underscored the importance of MCL faculty – now referred to as clinician-scholars/investigators - to contribute evidence of high quality scholarship in addition to serving as outstanding clinicians and teachers. This serves as a backdrop to the recent discussions we have had with the Provost and then our Executive Committee regarding faculty billets and caps.

As of this month we have 729 faculty in the School of Medicine (which includes faculty on campus as well as the VA and Santa Clara Valley Medical Center). These include 309 Investigators (UTL faculty), 347 Clinician-Scholar/Investigator and 73 Non-Tenure Line faculty. Following discussions with the Provost last spring about a billet cap, the Dean's Office undertook a thorough analysis of the school's billets. We reviewed all of the billet assignments identified in the School, corroborated those with our Departments, determined the number of currently approved active searches as well as billet commitments made to departments or chairs, and the projected number of new or incremental billets that departments needed during the next one to two years. We further carried out an analysis of the relative growth of our faculty over time based on recruitments and losses (to retirement or loss) and projected these forward to determine the future size of the faculty if no changes were made. Further, we included areas of

projected incremental faculty growth based on our new Stanford Institutes of Medicine, Bioengineering and key basic research and clinical areas. These data helped shape our planning and served as the data for a meeting with the Provost on Wednesday October 1st. Based on this, the following decisions have come forth from the University regarding our faculty billets and cap.

- The School is authorized to have a maximum number of faculty size of 900; this is our billet (or body count) cap. As noted above, we currently we have 729 faculty.
- The School's 900 billets are fungible among the faculty lines (University Tenure Line, Non-Tenure-Line, and Medical Center Line).
- In principle, the Provost would consider some flexibility in off-site appointments, including the possibility of additional billets for off-site usage. We currently have approximately 80 of our 729 faculty “off-site”.

Although having a faculty billet cap is new for the School of Medicine, it is appropriate and, based on the current allocations and assignments, will not adversely impact our strategic plans as long as we proceed with careful planning. However it will be essential that we critically assess every faculty appointment in order to assure that we are making the very best use of a billet. Accordingly, every faculty appointment will be viewed as an important component of our future community and the opportunity to fulfill our missions in research, education and patient care.

Our immediate challenge is that in addition to the current 729 faculty, the School has identified 134 active searches underway and some 62 billets that are vacant but which have some commitment attached to them. We want to honor the ongoing searches and commitments but it is important to underscore that just because a search has been authorized, that does not mean that an appointment will be made. Faculty appointments (and the assignment of a billet) will be guided by the quality of the candidate and the role she or he will play in the school.

On a practical basis, we will no longer assign billets at the time a search is authorized. A billet will only be assigned when a candidate has, in the School's assessment, met the criteria for appointment and the appointment file has been approved for submission to the Provost by the A&P committee and the Dean's office. Going forward we will be revising the process for approving searches and I will announce more about that in subsequent communications.

Because our faculty size is now limited to a potential of 900 and in recognition of the fact that our average rate of incremental growth during the last several years has been 30-40 new faculty per year (net of losses), it is clear that we need to be very thoughtful lest we run out of options in the next 5-6 years. This will require careful management and, by definition, a higher level of expectation for each faculty member's performance. I am very cognizant that this may pose some additional challenges for some members of our

community, especially the clinician-scholar/investigator MCL faculty – particularly since the expectations for appointment and promotion have increased over the years. Dr. David Stevenson, Senior Associate Dean for Academic Affairs, is available to address concerns and help advise and guide current members of the faculty who have concerns or questions.

In sum, while the new faculty billet cap poses some challenges, it is also helpful in defining the overall composition of our faculty and in underscoring the value and importance of every appointment. It is also worth mentioning that we are also fortunate to have the “clinician-educator” positions available within the School and recognize how important these physicians will be to our overall mission in patient care and education, recognizing also that the billet cap does not limit this group.

I want to thank several individuals who have spent numerous hours during the past months to gather the critical data and perform important analyses regarding our faculty billets and future plans. Among these are Kathy Gillam, Special Assistant to the Dean; Linda McLaughlin, Assistant Dean for Academic Affairs; Marcia Cohen, Chief Financial Officer and Assistant Dean for Finance and Administration; David O’Brien, Director of Institutional Planning; Dr. David Stevenson, Senior Associate Dean for Academic Affairs; and Dr. John Boothroyd, Senior Associate Dean for Research and Graduate Education.

NIH Releases its Roadmap

On Tuesday September 30, Dr. Elias Zerhouni, Director of the National Institutes of Health (NIH) released “The NIH Roadmap” which is posted on <http://nihroadmap.nih.gov> and summarized in a Policy Forum in the October 3rd issue of *Science* (pages 63-64). Among the key components of the NIH Roadmap are:

- ***New Pathways to Discovery*** – including:
 - Building Blocks, Pathways, a Networks Implementation Group
 - Molecular Libraries and Imaging Implementation Group
 - Structural Biology Implementation Group
 - Bioinformatics and Computational Biology Implementation Group
 - Nanomedicine Implementation Group
- ***Research Themes of the Future***
 - High-Risk Research Implementation Group (including the NIH Director’s Innovator Awards)
 - Interdisciplinary Research Implementation Group
 - Public-Private Partnership Implementation Group
- ***Reengineering the Clinical Research Enterprise***
 - Clinical Research Implementation Group

In preparing this bold new plan for the NIH, Dr. Zerhouni consulted with numerous scientists both intramurally and throughout the country. A number of faculty leaders at Stanford provided consultation and input to the process. I communicated with Dr.

Zerhouni on several occasions the plans unfolding at Stanford, especially our blueprint for *Translating Discoveries* – and we received considerable praise for our forward-looking agenda. Indeed, I believe that we are well-poised to match the plans that have been evolving at Stanford with those of the NIH and will be getting back to you about areas of alignment and opportunity.

Dr. William Mobley Named Director of the Stanford Neuroscience Institute

In the August 18th Dean's Newsletter (see <http://deansnewsletter.stanford.edu/>) I announced the progress underway in establishing the Stanford Neuroscience Institute, one of our four proposed Stanford Institutes of Medicine. I am pleased to announce today that effective September 25, 2003, Dr. William Mobley, John E. Cahill Family Professor in the School of Medicine and, by courtesy, of Neurosurgery, has been named the first Director of this new Institute. Dr. Mobley was recommended for this position by his peers and colleagues who have been members of the Stanford Brain Research Center and I am very pleased that he has agreed to assume this important new responsibility. Over the next several years, the Stanford Neuroscience Institute will be developed with the assistance of public and private funding and will help Stanford to further bridge our basic and clinical research communities within the School of Medicine and across the University. In order to devote his time and effort to the development of the Stanford Neuroscience Institute, he will step down as the Chair of the Department of Neurology. A Search Committee to identify the next chair has been appointed and will be led by Dr. Gary Steinberg, Bernard and Ronni Lacroute-William Randolph Hearst Professor in Neurosurgery and Neurosciences and Professor, by courtesy, of Neurology & Neurological Sciences. I am also appreciative that Dr. Mobley has agreed to continue his responsibilities as chair of Neurology until a successor has been named.

With the appointment of Dr. Mobley as Director, he joins Dr. Irv Weissman as a Stanford Institute of Medicine Director. During the next months we hope to announce the Director of the Stanford Institute for Cardiovascular Medicine and then subsequently for the Stanford Institute on Immunity, Transplantation and Infection.

Executive Committee Update: Report on Ophthalmology

At the Executive Committee meeting on Friday, October 3rd, Dr. Mark Blumenkranz, Chair of the Department of Ophthalmology, gave an update on the progress that has been made in the research, teaching, and clinical care activities over the past five years since he assumed leadership. He began by noting that Stanford had one of the earliest eye care departments, and was in fact the leading department on the West Coast during the 19th century and for the first half of the 20th century while the School of Medicine was located in San Francisco. However, it underwent a period of some decline when the School moved to Palo Alto in 1959 since most of the clinical faculty remained in San Francisco but has, in recent years, experienced rapid growth and improvement through the recruitment of new faculty and the initiation of new programs.

Currently the department consists of 16 faculty, including clinician educators, on the Stanford campus as well as five full time faculty at affiliated hospitals. In addition, there are nine residents (in three programs) and 11 postdoctoral scholars. The program also has 38 clinical staff at Stanford Hospital and Clinics and nine administrative staff.

The current facilities include the Main Eye Center and Eye Laser Center on the third floor of the Blake Wilbur Building, the free-standing California VitreoRetinal Center in Menlo Park, research laboratories in the Grant Building and at the High Energy Physics Laboratory on Stanford's main campus, and administrative offices in the Boswell Building. This dispersion of the department's activities is one of the challenges the department currently faces.

The department's clinical volume has grown over the past ten years from 14,226 ambulatory visits in FY93 to 32,916 in FY03. In addition, the department performed a total of 675 surgical cases at Stanford Hospital in FY03.

Dr. Blumenkranz described Stanford's vibrant and rapidly growing visual science community, which is conducting research in such areas as retinal pathophysiology, prosthetic vision, novel microsurgical tools, advanced diagnostics and imaging, therapeutic laser applications, ophthalmic tissue engineering, corneal prosthetics, and ocular microbiology. He highlighted three basic science research groups within the department: the Biomedical Physics and Ophthalmic Technologies group, headed by Dr. Daniel Palanker; the Ophthalmic Tissue Engineering Group, consisting of Drs. Harvey Fishman, Jaan Noolandi, and Christopher Ya; and the Ocular Microbiology Group, consisting of Drs. Hermina Minor de Kasper and Christopher Ta.

In the area of clinical research, Dr. Blumenkranz described the work being done at the California Vitreo-Retinal Center, which houses a clinical retinal electrophysiological laboratory. It is the site of numerous multicenter clinical trials evaluating a wide variety of diagnostic and therapeutic modalities including quantitative digital imaging, anti-angiogenic therapy for diabetic retinopathy and macular degeneration, as well as new surgical techniques. In addition, a number of clinical studies on refractive surgery are underway at the Stanford Eye Laser Center.

Among the department's recent accomplishments that were highlighted by Dr. Blumenkranz are:

- The establishment of the Stanford Eye laser Center in 1997, which has become the leading academic refractive surgery center on the West Coast
- The incorporation and growth of the California Vitreoretinal Center in 1997, which has become one of the two leading academic retinal centers on the West Coast.
- The recruitment of new faculty and expansion of such clinical subspecialties as corneal diseases; pediatric ophthalmology and retinal diseases; neuro-ophthalmology; and ocular oncology.

The department's goals include:

- Re-establishing, within the next five years, the Stanford department as one of the ten leading ophthalmology departments within the U.S.
- Becoming, within the next ten years, one of the five most elite programs, with leading programs in Interdisciplinary Vision Science, Clinical Care, and Resident and Fellow Education.

Dr. Blumenkranz's presentation highlighted the many areas of progress that have occurred under his leadership. I would like to thank him as well as all of the faculty, staff, and students who have contributed to the many accomplishments of the department.

Faculty-Student Partnership Program

On Tuesday evening, September 30th approximately 120 faculty met with medical students in the Dean's Courtyard to help foster greater interaction and communication between faculty and students to enhance mentoring and career guidance. Based on the attendance and dialogues that occurred, I would rate this as a very successful event. I want to thank Drs. Kuldev Singh and Denise Johnson along with Char Hamada and Robin Casey for putting together this program. Mentoring and guiding our students is one of the most important responsibilities we have in the School of Medicine. Coupled with the Faculty Advisor system, we now have multiple ways of being able to provide advice and input to our students – and to learn from them as well!

Events

- ***Fall Forum on Community Health and Public Service***

The Fall Forum on Community Health and Public Service will be held on Tuesday evening, October 14th in the Bechtel Conference Center (100 Encina Hall) from 5-7:30 PM and will feature poster and oral presentations being done by our Stanford Medical Students and their community partners. In addition, there will be a keynote address by Dr. Steven Schroeder, former CEO of the Robert Wood Johnson Foundation and currently the Distinguished Professor of Health and Health Care, Department of Medicine, UCSF. I hope you will mark you calendars and make every effort to attend.

- ***Walk for Juvenile Diabetes***

Once again a Stanford Medical Team will participate in the annual "Walk to Cure Diabetes. The event will be held on Sunday, October 19th at Shoreline Park in Mountain View. Registration is open at 8:00 a.m. and the walk (which is 3 miles) begins at 9:00 a.m. The 2003 Stanford Medical School Team Leaders for the Walk to Cure Diabetes include Quetzalsol Lopez, Cezar Hernandez, Antonio Alvarez, Sofi Meraz and Rubi Cortes

Please review the web site that is attached if you want to walk and recruit walkers for the Stanford School of Medicine Team

<http://walk.jdrf.org/register.cfm?id=85660380>. If you can't attend and wish to make a donation you can do so at <http://walk.jdrf.org/support.cfm?id=85660380>.

I want to thank our students and members of the Stanford Medical Community for their participation in this event.

- ***Tenth Thomas C. Merigan, Jr. Lecture***
 - On Tuesday, October 7th, Dr. Richard Klausner, Executive Director of the Global Health Programs, Bill and Melinda Gates Foundation, delivered the Tenth Thomas C. Merigan, Jr. Lecture. His presentation was entitled “*The Grand Challenges of Science & Technologies in Global Health*”. On October 17th, Rick Klausner and Harold Varmus will announce in Science the results of the “Grand Challenge” proposals that will be supported by the Gates Foundation. Obviously, it will be important for faculty to review the offerings and determine how Stanford might respond!
- ***Community Faculty Lecture Series***
 - On Wednesday evening, October 1st the second in our series of Community Faculty Lectures was held in the Fairchild Auditorium and addressed the topic of “Everyone Needs a Urologist. Problems of Incontinence, Stones, Cancer, Fertility and Development”. Special thanks to the Urology faculty who participated in the program, including Drs. Linda Shortliffe, Joseph Presti, Stewart McCallum and James Brooks. On November 3rd, Dr. Suzanne Pfeffer and the Biochemistry Department will host a session on “DNA Chips: A Breakthrough for Cancer Diagnosis”.

Awards and Honors

- ***New Recipients of Endowed Chairs:*** The Provost, President and Board of Trustees have approved the awarding of two endowed chairs to members of our School of Medicine faculty. These are:
 - **Dr. Roger Warnke** as the Ronald F. Dorfman, M.B.C., Professor in Hematopathology
 - **Dr. Richard Myers** as the Stanford W. Ascherman, M.D., F.A.C.S. Professor in Genetics

Please join me in congratulating Drs. Warnke and Myers.

- ***The Stanford Medical Youth Science Program (SMYSP)*** has been awarded funding for \$1.4 million dollars over the next five years from the National Heart Blood and Lung Institute (NHLBI). This award will expand SMYSP's activities to include year-round school-based science programs. It will also allow SMYSP to continue encouraging students to pursue advanced studies in the

biomedical and behavioral sciences, thereby increasing the number of health professionals in medically under-served communities.

Congratulations to Dr. Marilyn A Winkleby, Judith Ned and the staff of SMYSP for this wonderful accomplishment.

- ***Dr. J. Martin Brown*** was awarded honorary membership in the European Society for Therapeutic Radiology and Oncology (ESTRO) at their annual meeting, in Copenhagen, last week.
- ***The Office of Communications and Public Affairs*** has won an Award of Distinction from the AAMC for their web site. Eric Weissman and Susan Ipaktchian in our office and Kevin Boyd at MedIT all contributed to the redesign of the site and were recognized for their efforts.
- ***Dr. Kelly Skeff*** is the recipient of this year's McCann Foundation Scholars Award for his years of dedication and excellence in mentoring.
- ***Drs. Ajay Chawla and William Talbot*** have been named Rita Allen Foundation Scholars in recognition of their research contributions.

Dean's Newsletter

October 27, 2003

Notable Upcoming Events

- US Poet Laureate to Visit the School of Medicine: On Wednesday, November 12th a Poetry Reading by Billy Collins, US Poet Laureate will be held at Noon in the Fairchild Auditorium. This is made possible by a generous gift from Helen and Peter Bing and is sponsored by the Arts and Humanities Medical Scholars Program and the Biomedical Ethics and Medical Humanities Scholarly Concentration. I particularly want to acknowledge Dr. Audrey Shafer, Associate Professor of Anesthesiology, for making this important presentation possible. I hope you will attend.
- Dr. David Satcher to deliver the 2003 Symposium on Improving Diversity in Graduate Education. On Tuesday November 18th Dr. David Satcher, US Surgeon General (1998-2002) and currently the Director of the National Center for Primary Care at the Morehouse School of Medicine, will speak at noon in the Clark Center Auditorium. For additional information contact Kimberly Griffin at kgriffin@stanford.edu.

New Department of Otolaryngology-Head & Neck Surgery

I am very pleased to announce that on October 14th the Board of Trustees of Stanford University approved our request to create a new department of Otolaryngology (ORL) - Head & Neck Surgery in the School of Medicine. This will provide an opportunity for

Stanford to further develop its education, research and patient care activities in this important area of clinical medicine. Although this department is new for Stanford, it should be noted that more than 90% of medical schools have such a departmental status for this area. Until now, ORL was administratively housed in the Department of Surgery. I want to thank Dr. Tom Krummel, Chair of the Department of Surgery, for his important help and support in the initiation of this new departmental status.

I am also pleased to let you know that Dr. Robert Jackler, who recently joined Stanford as the chief of the division of ORL, will become the first Chair of the new department of Otolaryngology-Head and Neck Surgery. Dr. Jackler, who is an internationally recognized leader in this field, is uniquely qualified to serve this important role. I am pleased for him and for Stanford that he has agreed to take on this new responsibility.

Board of Trustees: Some Updates on Lucile Packard Children's Hospital and the Stanford Hospital & Clinics

At the Medical Center Committee of the Stanford University Board of Trustees meeting on October 13-14, their respective CEO's, Chris Dawes and Martha Marsh gave presentations about the status of LPCH and SHC. I will summarize some of the highlights of their comments.

- **LPCH:** Mr. Dawes noted that among the most important drivers for the success of LPCH are the successful implementation of its strategic plan; the necessary investments in the programs and leaders in LPCH and the School of Medicine that are enabled by the support of the Children's Health Initiative; the continued growth of LPCH as a regional and national center (in addition to serving the needs of our local community); and judicious and rigorous operational and fiscal management. Mr. Dawes noted that between FY01 and FY03, significant changes have occurred in patient care activities. Notably, inpatient days have increased by 9.1%, discharges by 0.9%, outpatient visits (inclusive of all sites) by 10.8%; and surgery and procedures by 30.3%. These increases in patient care activity have certainly put a strain on the faculty and staff caring for an increasingly sick population of children but have also brought a number of new and important clinical services to this community. They have also increased the operational and fiscal performance of the hospital - consistent with the overarching goals of achieving both preeminence and sustainability. These programs have also been enabled through the support (both grants and gifts) from the Lucile Packard Foundation of Children's Health and the Children's Health Initiative.

During the next several years, the goal of LPCH is to continue to develop its key centers of excellence along with other important services. These include the Heart Center, Cancer Center, Neurosciences and Neurosurgery, Transplantation and Maternal-Fetal Medicine. In addition, surgical programs (including minimally invasive surgery and orthopedics) will also be targets for major initiatives. Accomplishing this level of program development has put a significant strain on the existing inpatient and ambulatory resources at LPCH and has compelled a

major plan for both the renovation of existing facilities as well as strategic planning for additional onsite and offsite care facilities. The goal is to match the facilities development with clearly defined program requirements - aimed at improving patient and family services and enhancing the sustainability and preeminence of LPCH for the decades ahead.

- **SHC:** Ms. Marsh also reviewed her goals for SHC. These include improving the quality and patient satisfaction of the clinical programs offered at SHC in conjunction with improving the financial strength of the institution so that it can support its key missions. Recognizing that just over 60% of the patients served at SHC come from the counties of Santa Clara and San Mateo, she offered plans for a local/Peninsula as well as regional/national and international patient care strategy.

As part of the local strategy, she addressed the importance of SHC's partnering with the School of Medicine faculty to develop and provide a full complement of services, including off-site ambulatory services in primary care as well as specialty programs. In tandem with these services, she noted that the regional/national strategy for SHC would be closely integrated with the School's plans for the Stanford Institutes of Medicine and would address programs in Cancer, Cardiovascular, Neuroscience and Transplantation.

Developing and sustaining program development is contingent on a sound fiscal performance. While this is a very challenging time for academic medical centers, and whereas SHC had a significant deficit in operations in FY01, it has shown steady improvement and positive bottom-line fiscal performance in FY02 and FY03. This is enormously important and offers hope of continued success for the future

Planning for an NCI Comprehensive Cancer Center

With the inception of the Stanford Institute for Cancer/Stem Cell Biology and Medicine, we have been proceeding with the planning for a Stanford NCI-designated Comprehensive Cancer Center. This effort is being lead by Dr. Karl Blume, Professor of Medicine (Emeritus) and Associate Director of the Cancer/Stem Cell Biology and Medicine Institute and formerly director of the Bone Marrow Transplant Service. We are currently planning to submit an application to the NCI in October, 2004. In anticipation of that, a Retreat is planned for Saturday November 15th in the Clark Center (if you are interested in participating but have not yet signed up please contact Sharon.Olsen@Stanford.edu or kgblume@stanford.edu. In preparation for the Retreat, Dr. Blume held a planning meeting for various program leaders Wednesday evening, October 22nd.

Because we are operating on an ambitious time-line, I want to update some of the issues covered during our planning meeting. Importantly, it should be noted that to receive recognition as an NCI designated Comprehensive Cancer Center, an institution must have

a reasonable depth and breadth of research activities in basic, clinical and population based research along with evidence of interactive research that bridges these three areas.

Currently, there are 61 NCI-designated Cancer Centers in the USA. Of these, 39 are Comprehensive Cancer Centers, 8 Basic Research Cancer Centers and 14 Clinical Cancer Centers. Nine of the Cancer Centers are in California (including 2 Basic, 1 Clinical and 6 Comprehensive). Remarkably, Stanford has never formally applied for NCI-designation although it has made several internal moves to do so during the past three decades. (I will not review the history that surrounds this - which is all too well known to many). However, I am intent that we should become a Comprehensive Cancer Center during the next several years.

To be successful in our application, we will have to demonstrate evidence of the following characteristics.

1. A focus on cancer evidenced by available grants and contracts in cancer research.
2. Evidence of institutional commitment by an organizational structure that provides sufficient resources (including space and positions) and a Director who has a position of importance at the institution (e.g., at the same level as a department chair) and evidence of continued support should there be a change in the directorship.
3. A Director who is recognized as an outstanding scientist and who has administrative leadership and authority that is clearly supported by the institution. Importantly, the director must have control over the appointment and review of the faculty to the Cancer Center and must also have authority over specifically designated research space, equipment and related resources. Furthermore, the Director needs to have the authority to assure adequate inpatient and outpatient facilities to achieve the objectives of the NCI Cancer Center.
4. There needs to be evidence of the promotion of initiatives and collaborations within and among the major programmatic areas of the cancer center and an internal process for decision making and priority setting. Further, there needs to be an external advisory committee that provides independent input to the Cancer Center Director.
5. The NCI believes that Cancer Centers are more successful in establishing a distinct identity if they have a clearly identifiable location and if there is administrative oversight over shared resources (i.e., cores).
6. There needs to be evidence of interdisciplinary coordination and collaboration that enhances and adds value to the productivity and quality of the institution's cancer research.

At this juncture, we have some but not all of these characteristics and clearly, during the months ahead, we will be working to achieve all of them. This will be the focus for some of our discussion at the November 15th Retreat. We have also assembled an outstanding External Advisory Board that will be visiting in March to review our progress and plans. This Board includes Drs. Marty Abeloff (Johns Hopkins), Ed Benz (DFCI/Harvard), John Glick (U Penn), Ed Harlow (Harvard), Lee Hartwell (Fred Hutchinson Cancer Research

Center), John Niederhuber (U Wisconsin), Louise Strong (MD Anderson) and Marcy Waldinger (U Michigan).

During the past months, Dr. Blume has been working with leaders at Stanford as well as visiting other Cancer Centers around the country to more formally engage our planning process. Although the exact number of programs that will be included has not yet been determined, there are currently 13 programs and 14 shared services (“cores”) that are being evaluated and developed. I am taking the liberty of including the complete list in this Newsletter both to provide an update on the current planning and to solicit additional input from faculty about the currently designated list or other suggestions or ideas that you might have. I am also including the current program leader recognizing that other faculty have already been designated for these various areas as well.

- ☐ ***Programs in Basic Cancer Research***
 - ☐ Cancer/Stem Cell Biology Research
 - ☐ Program Leader: Irv Weissman
 - ☐ Genomics & Proteomics Research
 - ☐ Program Leader: Pat Brown
 - ☐ Radiation Biology and DNA Repair Research
 - ☐ Program Leader: Amato Giaccia
 - ☐ Cancer Biology, Oncogene and Cell Cycle Research
 - ☐ Program Leader: Joe Lipsick
 - ☐ Cancer Immunology Research
 - ☐ Program Leader: Edgar Engelman
 - ☐ Cancer Cell and Tissue Imaging Research
 - ☐ Program Leader: Sam Gambhir
 - ☐ Biomedical Informatics and Biomedical Computation Research
 - ☐ Program Leader: Mark Musen
- ☐ ***Programs in Translational/Clinical Cancer Research***
 - ☐ Pediatric Cancer Research
 - ☐ Program Leader: Mike Cleary
 - ☐ Lymphoma and Hodgkin’s Disease
 - ☐ Program Leader: Ron Levy
 - ☐ Hematopoietic Cell Transplantation: Biology and Therapy
 - ☐ Program Leader: Ron Negrin
 - ☐ Genetics of Solid Tumors
 - ☐ Program Leader: Jim Ford
 - ☐ Cancer Pharmacology/Experimental Therapeutics
 - ☐ Program Leader: Brandy Sikic
- ☐ ***Program in Population Sciences and Education***
 - ☐ Cancer Epidemiology/Outcomes Research; Patient Information-Education
 - ☐ Program Leader: to be announced

In addition to these program areas, the following cores and their leaders are potentially envisioned:

- ☐ ***Cores - Shared Services***

- ☐ Biostatistics for Clinical Cancer Research - Leader to be announced.
- ☐ Clinical Trials Office - Brandy Sikic
- ☐ Informatics Core - Henry Lowe
- ☐ General and Specialized Animal Resources - Linda Cork
- ☐ Cell and Tissue Distribution - Jonathan Pollack, Jeff Norton
- ☐ High Throughput DNA Sequencing/SNIP - Ron Davis, Peter Oefner, Rick Myers
- ☐ Cancer Imaging - Chris Contag, Sam Gambhir
- ☐ Confocal and Immunoelectron Microscopy - Steve Smith, Tobias Meyer
- ☐ Flow Cytometry - Gary Nolan, Lee Herzenberg
- ☐ Hybridoma - Mike Cleary
- ☐ Transgenic and Knockouts - Mike Cleary, Dean Felsher
- ☐ DNA-Microarray - Gavin Sherlock, Jonathan Pollack, Jan Matthijs van de Rijn, Mike Fero
- ☐ Proteomics - Peter Jackson, Gary Nolan
- ☐ Translational/Clinical Research Resources - George Fisher

To help stimulate the planning and development in each of these areas, I was pleased to announce, at the program planning event, that we would commit \$50K as seed money to each project and core in order to stimulate the development of these areas in preparation for the NCI Comprehensive Cancer Center Grant preparation and submission.

We are on a very ambitious schedule to complete and submit our application to the NCI in October 2004. I want to thank Dr. Karl Blume for the progress he has made to date but also to encourage any of you who are interested in participating in this effort to let us know. Again, the next big event will be our Retreat on Saturday, November 15th in the Clark Center.

Executive Committee: Update on Neurosurgery

At the October 17th Executive Committee, Dr. Gary Steinberg, Chair of the Department of Neurosurgery, gave a fascinating and exciting review of the department and highlighted the positive changes that have occurred over the past seven years since he assumed the leadership of the department.

Among the clinical areas he described were:

- ☐ The Cerebrovascular/Stroke Team, which includes the Intracranial Vascular Malformations group as well as the Stanford Stroke Center.
- ☐ The Radiosurgery program, including the Stereotactic Radiosurgery Program.
- ☐ Spine Neurosurgery
- ☐ Functional Neurosurgery, which includes movement disorders and pain
- ☐ The Stanford Comprehensive Epilepsy Center
- ☐ The Brain Tumor/Neuro-oncology Center
- ☐ The Stanford University Skull Base Team
- ☐ Palo Alto VA Hospital

Dr. Steinberg described the impressive volume trends the department has achieved in total Neurosurgery Service O.R. cases, discharges and days, charges and collections during the past several years. He also provided brief sketches of the department's research areas including:

- ☐ Oxidative stress-related mechanisms of CNS injury
- ☐ The Stanford Neurosurgery Image-Guided Laboratories, including the work of the
- ☐ Stanford Surgical Planning Team
- ☐ Mechanisms of cerebral ischemic injury as it pertains to inflammation, oxidative stress, and apoptosis
- ☐ Brain tumors (the role of bone marrow derived putative endothelial progenitor cells in tumor angiogenesis)
- ☐ Human neuronal stem cells: Control and consequence of neurogenesis in the adult
- ☐ Mild hypothermia, which has been found to provide excellent protection against experimental cerebral ischemia and traumatic brain injury

Importantly, Dr. Steinberg noted that the department's research programs are now ranked 6th nationally in NIH funding. In addition, the department currently has two NIH project grants (Stanford is the only Neurosurgery Department in the country to have two such project grants). They are the Center for Cerebrovascular Disease and the CNS Injury and Edema Research Center.

Dr. Steinberg also described the improvements that have occurred in the Residency Program since 1995, when the department faced the possibility of probation by the Residency Review Committee. Impressively, the department now has a full five-year accreditation and matches its top #1-5 choices out of more than 100 applicants per year. The department recently instituted new requirements for the residency program; these include the submission of peer-reviewed grants for a research year and the presentation of written scholarship at national meetings.

At the same time, it is important to note that the department of Neurosurgery faces similar challenges as other departments; these include funding, space, billets, and recruitment/retention issues. On the other hand, the department also sees great opportunities in taking advantage of advances in computer technology, imaging, bioengineering, molecular and cellular biology to develop new clinical therapeutic strategies. These might include:

- ☐ Minimally invasive surgery
- ☐ Neuromodulation (CNS stimulation)
- ☐ CNS tissue repair
- ☐ Robotic assisted surgery
- ☐ Neurotransplantation for stroke

Dr. Steinberg concluded by pointing out that in 1996, the department's goal was to develop the best Neurosurgery Department in the country over the next decade. Today,

he sees the goal as the development of the finest Neuroscience Institute in the country, one that would:

- Provide the best clinical care and most innovative clinical advances;
- Explore the most exciting fundamental discoveries in neurobiology and technology;
- Set an example for successful translation of basic and clinical research into improved outcome for patients with neurological diseases.

I want to thank Dr. Steinberg for his thoughtful leadership and the faculty, staff, trainees and students of the department of Neurosurgery for their impressive accomplishments.

Fall Forum on Community Scholarship and Service

On Tuesday, October 14th our students led, coordinated and presented at the Second Annual Fall Forum on Community Scholarship and Service. Demonstrating that service to the community can be coupled with thoughtful and analytic studies to demonstrate their performance, we were treated to poster and oral presentation on a wide-reaching array of topics. Special thanks to Anne Braun Zink (SMS II) and Brent Kobashi (SMS II) for their important leadership in this event.

In addition to excellent oral presentations by Khaliah Johnson, Courtney Griffiths, Glenn Valenzuela, Joyce Javiar, Andrea Pomrehn, Ward Myers, Brent Kobaschi and Elise Lawson, we were also treated to a presentation by community partner Mr. Luther Brock and a special keynote address by Dr. Steven Shroeder, formerly CEO of the Robert Wood Johnson Foundation and presently Professor at UCSF.

This is an excellent event and if you didn't have the opportunity to attend it this year, I hope you will make every effort to do so when it is held next Fall!

Bing Lecture Series Resumes

On Wednesday, October 15th the Bing Lecture Series commenced for 2003-2004. This tradition which dates back decades, involves having a Stanford School of Medicine faculty member deliver a special lecture to a group of friends of Stanford in Los Angeles. Our first speaker of this season was Dr. Sam Gambir, Professor of Radiology, who recently joined Stanford from UCLA to serve as the director for the rapidly evolving area of molecular imaging. He gave an excellent presentation.

Other faculty selected to present at the Bing Lecture series include Marlene Rabinovitch, M.D., Dwight and Vera Dunlevie Professor of Pediatrics, Professor of Developmental Biology and Research Director of the Wall Center for Pulmonary Hypertension; Gary Heit, Assistant Professor of Neurosurgery; and Michael Longaker, Deane P. and Louise Mitchell Professor in the School of Medicine.

Fostering Compliance and Integrity in Clinical Research

On Monday October 20th, the Stanford ACCESS Program sponsored its 4th Annual Symposium for Clinical Research Personnel. I want to thank at the outset Dr. Steve Alexander, Director of ACCESS, along with Mary Sweeney and members of the ACCESS Clinical Trials office, for making this another very successful event.

As with past symposia, this year's event dealt with the extremely important topic of compliance and integrity. The Keynote Speaker was Dr. Arthur Rubenstein, Executive Vice President and Dean, University of Pennsylvania. In addition to experiences emanating from a long and distinguished career as a physician-scientist, Dr. Rubenstein also chaired the Institute of Medicine's Committee on Scientific Integrity, the recent report of which addresses the important topics of individual and institutional integrity.

Through the symposium, by case study (and some theater), speakers addressed some of the key issues that challenge compliance including: unapproved tissue banking; improper consent process; data gathered outside of IRB approval; lack of training of investigators and staff; failure to adequately inform patients of risks associated with a clinical trial; inadequate protection of privacy and confidential data; not informing the IRB of collaborating sites; databases and privacy; inappropriate recruitment of subjects; and changes to the protocol without IRB approval. Because any one of these can impact institutional compliance, it is imperative that participants in the clinical research process become as informed as possible about their responsibilities and the appropriate and safe conduct of clinical research. This year's ACCESS symposium provided lots of insights and education to help our research community be informed - and compliant.

Clark Center Dedication and BioX

During the past weeks much has been written about the Clark Center and BioX, culminating in the dedication of the Clark Center on Friday October 24th. I certainly won't repeat the comments and reports that have appeared in various publications (see summary in the October 22nd issue of the Stanford Report - <http://www.stanford.edu/dept/news/report/>). At the same time, I want to thank all of the School of Medicine's faculty, students and staff for the work they have done to bring this important interdisciplinary program to its current level of success. There is little doubt that in the years ahead, programs like BioX will define Stanford and create a new landscape for education and research - and a resource for generating knowledge that can help fulfill our mission in "Translating Discoveries."

I would be remiss however if I did not thank some of the individuals within the School of Medicine who played a key role in the early developments of BioX. I apologize in advance if my acknowledgement list is incomplete - but it should certainly include Professors Jim Spudich, Bill Mobley, Lucy Shapiro, Harvey Cohen - and, of course, Matt Scott, who now serves as the Program Director for BioX. In a number of important ways, BioX is building on previous Stanford programs that have fostered interdisciplinary education and research and which are clearly part of our institutional fabric - and undoubtedly much of the future in the 21st Century and beyond.

NIH Roadmap and the Grand Challenges

In the October _ Dean's Newsletter, I commented on the recent announcement by the NIH of its new Roadmap for Research (www.nihroadmap.nih.gov) and, in addition, on the announcement in the October 17th issue of Science on the Grand Challenges that will be supported by the Bill and Melinda Gates Foundation (www.grandchallengesgh.org). These are significant events in that they are likely to have an impact on reshaping the way we conduct biomedical research. While it is imperative to foster investigator initiated basic research and to support it via the traditional NIH RO1 funding mechanism, it is clear that both the NIH and the Gates Foundation are planning to support more team-based problem oriented research that addresses important questions and which has an impact on translating discoveries from the bench to the bedside (and back).

I believe that our Strategic Planning process in the School of Medicine during the past two years has made us uniquely suited to seize some of these new opportunities. To help explore ways to do that, I have asked Drs. Harry Greenberg and John Boothroyd, Senior Associate Dean's for Research, Graduate Education and Postdoctoral Affairs, to lead a task force that ascertains how we can optimize our institutional success. They will also explore what resources may be necessary to enable us to be as successful as possible. I will be reporting about their progress in future issues of the Newsletter - but also want to encourage you to submit your ideas or suggestions to Drs. Greenberg and/or Boothroyd.

Newly Elected Members to the Institute of Medicine, National Academy of Sciences

At its national meeting on October 27-28, the newly elected members to the IOM were announced. Of the 70 new members, four are from our Stanford faculty. They include:

- Ann Arvin, Lucile Salter Packard Professor of Pediatrics and Professor of Microbiology and Immunology
- Helena Kraemer, Professor of Biostatistics in Psychiatry
- Alan Schatzberg, Kenneth T. Norris, Jr. Professor of Psychiatry and Behavioral Sciences
- Mark McClellan, Associate Professor of Economics and of Medicine and of Health Research and Policy (currently on administrative leave)

This brings our total Stanford membership in the IOM to 38 members. Given the small size of our School, this is an amazingly high number of individuals who have achieved this impressive distinction.

Additional Selected Awards and Honors

- ***Professor Irv Weissman*** has been selected as this year's recipient of the J. Allyn Taylor International Prize in Medicine for his extraordinary contributions to science in the area of Cell-Based Therapeutics. The Prize will be awarded in London, Ontario, on November 5, 2003.

- **John J. Barry, MD**, Director of the Neuropsychiatry and Individual Psychotherapy Clinics and Assistant Professor of Psychiatry has been awarded the ninth Annual Outstanding Faculty Physician Award for excellence in the specialty care of students, from the Vaden Heath Center

Announcement

- The next Community Lecture Series will be held at 7:00 p.m. on Wednesday, November 5th at the Clark Center Auditorium. Suzanne Pfeffer, PhD, Chair of the Department of Biochemistry, will discuss "DNA Chips: A Breakthrough for Cancer Diagnosis" and cover innovative new molecular and genetic tools for diagnosing disease. This free event is one of an ongoing series of lectures on important issues in health care and biomedical research.

Appointments and Promotions

- **Mark Blumenkranz** was reappointed to Professor of Ophthalmology at the Stanford University Medical Center, effective 2/1/2004.
- **Matthew Bogyo** has been appointed to Assistant Professor of Pathology, effective 11/1/2003 to 10/31/2006.
- **Andrew Fire** was appointed to Professor of Pathology and of Genetics, effective 11/1/2003.
- **Shai Friedland** was appointed to Assistant Professor of Medicine (Gastroenterology and Hepatology) at the Palo Alto Veterans Affairs Health Care System, effective 10/1/2003 to 9/30/2006.
- **Kevin Lemley** was appointed to Associate Professor of Pediatrics (Nephrology) at the Lucile Salter Packard Children's Hospital, effective 10/1/2003 to 9/30/2008.
- **Robert Norris** was reappointed to Associate Professor of Surgery (Emergency Medicine) at the Stanford University Medical Center, effective 2/1/2004 to 3/31/2009.
- **Minnie Sarwal** was appointed to Associate Professor of Pediatrics (Nephrology) at the Lucile Salter Packard Children's Hospital, effective 10/1/2003 to 9/30/2008.
- **Kuldev Singh** was appointed to Professor of Ophthalmology at the Stanford University Medical Center, effective 10/1/2003.
- **William H. Robinson** has been appointed to Assistant Professor of Medicine, 11/1/2003 to 10/31/2006.

Dean's Newsletter

November 10, 2003

Reflections From the Community on the Future of Medical Education: Sustaining a Human Connection.

During the past several months we have been holding a number of evening discussion groups with interested members of our community on the future of medical education. Thanks to the hospitality of Dr. Ralph and Marilyn Spiegel, two dinners were recently held in their home that offered the opportunity to discuss, in a small group setting, what interested members of our community believe is important in the education of outstanding physicians. At these events I had the opportunity to reflect on the goals and objectives we have set for medical education at Stanford. Importantly, these events have also afforded an opportunity to listen and learn from individuals who share a concern and commitment about the future of medicine.

It has been remarkable to me that at each of these sessions a common theme has emerged. While it is obvious to all that great strides have been made in science and that research has improved significantly, innovations in health care, nearly everyone with whom I have spoken has virtually independently identified something that they believe is lacking in modern medicine and its practitioners. Namely, the human touch, the connection of the physician to his or her patient, the time available for doctors to listen to what their patient is saying and spend the requisite time responding to their concerns. It is the perception that modern medicine has been disrupted by the economics that surround health care, its rising costs, the problems with accessibility and the opportunities for choice. In important ways, our community has recognized and articulated the unfortunate dichotomy that now exists in American medicine: the unparalleled opportunity for continued scientific discovery and innovation that will reshape how we approach the diagnosis, management and prevention of human disease cast against the chaos and uncertainty of health care access and delivery in the current fiscal environment in which premiums are rising, access is challenged and the time that a physician can spend with his or her patient – listening to their concerns and making that human connection – is increasingly challenged.

The dilemma is exceptional and the solutions are not easy. Clearly we can react to some of the challenges at hand – but others will need a wider solution, likely both political and legislative. We can and must, of course, not lose sight of educating our students and trainees to learn, to listen, to reach out and to connect to their patients. Some have called this the “art-of-medicine” others the “bedside manner”. From my perspective it is the fundamental underpinning of what makes a great physician. Exceptional scientific knowledge, along with a critical and analytic approach to clinical care that is evidence based and data-driven is essential. But unless these skills are coupled with a caring and compassionate manner, the value of the patient encounter is diminished. Importantly the patient feels less well served and perception of the physician as a “healer” is altered.

We are now engaged in the New Curriculum that impacts our First Year Students, as well as the continued training and education of outstanding students and residents who have joined the Stanford community during the past several years. Assuring that each develops the knowledge and skills of the compassionate and caring physician is essential. It is incumbent on us to make this part of every patient encounter and also to formalize it in our clinical training and evaluations. I believe this is an area that we can and must do better than we have in the past. It is also one where we need to hold each other mutually accountable and responsible in assuring that patients and our community are well served. That is what they are seeking –and that is what they should receive.

As to the broader agenda regarding the future of health care, I strongly feel that academic medical centers, including Stanford, need to be much more proactive in the process. To date, most centers have been reactive and, as a consequence, our centers and the public have both suffered. We have not done a very good job of communicating the issues or championing potential solutions – including in a public forum. Whether one believes that the way to control costs and improve quality of service and care resides in stronger market competition, with increased responsibility by the consumer, or in a more fundamental change toward a single payer system, it seems clear and increasingly inevitable that major change will come. The current scenario of double-digit increases in health care premiums, the challenges of access, the limits on quality and service, are not sustainable.

As these changes unfold it is imperative that we not lose sight of the future. It is all too easy to believe that the solution resides in “managed competition” and access to the low cost provider. But that loses sight of the importance of supporting research and innovation to improve health care – something that low cost providers and insurance companies do not invest in – but rather expect to receive. Our academic medical centers are critical to our future health care system – but they require support from our communities. While the public has been generous in the past, it is also clear that their future investments in supporting academic medical centers are also likely to be influenced by their perception of the quality of our physician work force and community. The message I have received and reflected above is that we need to do more to educate and train our physicians to be better listeners and more compassionate healers. However, finding time for them to serve patients is squandered by a health care system that makes medicine a commodity and treats patients as economic units or “market share”. Clearly coupling our education of physicians with a much stronger voice in changing the health care environment is essential – to American Medicine and to Stanford. We all need to work on this if we are to succeed in the future.

Update on SMILE: A Local and National Perspective

During the past year, the Stanford Medicine Information and Learning Environment (SMILE) planning group has made considerable progress in defining the scope of the programs for our future education and library facilities. We now envision a 120,000 gasf building that will be housed on the site currently occupied by the Fairchild Auditorium that will serve as the hub for our immersive learning programs (with additional programs

at the VA Hospital, Stanford Hospital & Clinics, Lucile Packard Children's Hospital, SUMMIT) and other areas of the School and University. We are also planning for much more flexible conference facilities that will include large and small classroom settings enabled by innovative technology. Central to SMILE will be the Knowledge Management Center that will provide distributed digital information (journals, books, etc) throughout the Medical Center as well as a facility in SMILE for interaction, education, resource development and research. As we craft and refine the plans for SMILE, we are also engaged in – and hopefully also leading – a national debate on the future of libraries.

Along with Parvati Dev, Associate Dean, Learning Technologies and Director, SUMMIT Lab and Debbie Ketchell, Associate Dean for Knowledge Management and Director, Lane Medical Library, I attended and spoke at a national symposium sponsored by the National Library of Medicine on November 5-6th. Whether medical centers of the future will still have a traditional library or have an entirely digitalized distributive model was at the heart of the debate at this conference. We had the opportunity to present the approach we are developing at Stanford, thanks to the very able program leadership of Ms. Maggie Saunders. It is our view that SMILE will be more than a place – it will truly be a distributed environment for learning and education. It will also serve as the hub for our knowledge center, providing a crossroad for communication between and among faculty, students, staff and the community. But it will also provide a locus from which knowledge will be disseminated to desktop computers throughout the medical center, at home or anywhere where access to the Stanford Medical Information Technology System is possible.

Debbie Ketchell summarized the discussions that took place about the library of the future as follows:

“Libraries are becoming locally divergent, integrated into multi-functional buildings and managers of learning spaces. Space should be highly flexible for an indeterminate future.... The library is a shared, collaborative space for scholarship and learning. Innovation happens where disciplines collide. The library is a place of refuge for quiet study and thinking.

“The library is a human space. The essence of good space remains the same: good location; natural, filtered light; transparency; bring the outdoors in; comfort and social ambience; and inspiration with modern functionality.... Plan for library as place and virtual service.

“The library is a knowledge hub: a site for both knowledge management and curriculum development. The library supports communication: staff-staff, user-user, and user-staff. Wireless, mobile, anywhere access will be the norm....Content is moving rapidly to digital and print materials are moving into compact and high-density storage. ...”

It is encouraging to know that we have anticipated and planned for these important considerations in our SMILE project.

Science and the Public: Challenges to the Integrity of Investigation

Peer-reviewed publicly supported research takes many forms but rarely does it become the target of religious groups or political oversight. Behavioral research can be more vulnerable to attack because it can touch on sensitive issues that may raise concerns among special interest groups. At the same time, behavioral research is essential to how we address major public health problems and disease – whether they are access to care or high-risk behaviors (including sexual activities) that result in vulnerability to disease. One might argue that had the behavioral research agenda been more robust and engaged during the early days of the AIDS pandemic, it might have been possible to have limited the current global impact of this disease.

It is thus with serious concern that one must view the recent news that religious groups and members of congress have become directly involved in scrutinizing some 200 NIH funded grants addressing sexual behavior. While one does not deny that some of this research is likely to be controversial, it is essential to affirm that that peer-reviewed scientific research should not be singled out for targeting – potentially adversely impacting its ability to better inform the way we approach public health and preventive medicine issues and challenges.

While as best as we can tell, none of these targeted 200 investigators are at Stanford, this is an issue that affects us all – and that we must strongly oppose. I raise my personal opposition to such a policy and call on each member of our community to be attentive and vigilant to the current environment that has disbanded scientific advisory groups, imposed a standard of what might constitute “ethical behavior” and now challenges the integrity of the NIH peer review process. The Association of American Medical Colleges has deplored “all efforts to subject the NIH research portfolio and individual research grants to ideological litmus tests”. The AAMC has gone on to state that the “American public must demand that the most scientifically rigorous and relevant research addressing vital public health concerns be funded without regard to the sectarian or ideological views of political parties or other special interest groups - regardless of where they reside on the ideological spectrum”.

As members of the scientific community – and one engaged in trying to improve the public health through research – it is imperative that we each stand against such invasions to scientific integrity.

Health and Public Policy Forum

We are in the process of formalizing a Health Policy Forum that will address important issues and challenges in health care, medicine and public policy. We anticipate that in the future, speakers at the Health Policy Forum will include members of our Stanford community as well as invited guests.

I am pleased to invite you to a School of Medicine Health and Public Policy Forum on Monday, November 24, 2003. Our guest will be Senator Arlen Specter, who will discuss his vision for the future of NIH and other policy issues including stem cell research. The forum will take place at the Clark Center Auditorium, 318 Campus Drive West, Stanford, California, from 9:30 to 11:00 a.m. I hope you can join me for this event. We expect a lively exchange of ideas.

Senator Specter currently serves as the Chairman of the Labor, HHS and Education Appropriations Subcommittee, the congressional committee that makes yearly federal funding decisions for the National Institutes of Health. It is with Senator Specter's consistent support that the NIH budget has doubled in recent years. Most recently Senator Specter joined forces with California Senator Dianne Feinstein to offer an amendment in favor of an additional \$1.8 billion over President Bush's fiscal year 2004 budget request for NIH.

If you are interested in attending please send your RSVP to janab@stanford.edu by November 17th to confirm your attendance. I look forward to seeing you there.

Planning for the NIH Roadmap

As noted in the October 27th issue of the Dean's Newsletter (<http://deansnewsletter.stanford.edu/>) I commented that we have put together a Task Force to help assess our response to the Road Map and the various RFAs that will emerge from it. The group has begun meeting and I will update you on their progress as it unfolds. I also had a very helpful meeting with Dr. Elias Zerhouni, Director of the NIH, while I was in Bethesda earlier in the week. He has already affirmed how closely our Stanford School of Medicine Translating Discoveries aligns to the NIH Road Map. Moreover, he indicated that he views Stanford as one of the few medical schools clearly committed to innovation and translational medicine and proffered that this commitment should help our efforts in further aligning with the NIH's future directions. Clearly that is very much our goal.

Association for the Assessment and Accreditation of Laboratory Animal Care to Visit Stanford

Dr. Linda Cork, Chair of the Department of Comparative Medicine has asked that I share the following message with you.

“On November 18-20 the Association for the Assessment and Accreditation of Laboratory Animal Care (AAALAC) will conduct an accreditation site visit of Stanford. AAALAC is an independent organization of basic scientists, veterinarians, and animal care specialists that reviews and certifies animal care programs. AAALAC is concerned with whether the appropriate mechanisms and processes are in place to ensure quality animal care. They want to be certain that the institution has the means to oversee the welfare and safety of animals and the people who work with animals in research settings. AAALAC accreditation, like accreditation by other accrediting organizations, is

extremely important for Stanford. It is the “*Good Housekeeping* seal of approval” for animal care, and being AAALAC accredited greatly simplifies the grant process where animals are used.

“If you work with animals, you can anticipate that AAALAC site visitors will come to your laboratory during the site visit. The AAALAC site visitors are your colleagues and experienced scientists; they are very knowledgeable about laboratory animal research in academic research institutions and industry. Site visitors will be interested in your animal research, and how you perform it. It is highly likely that they will ask questions of you, your students, or staff in a low key, conversational manner. The sorts of questions that AAALAC site visitors have asked during site visits include:

- Have you read your animal care protocol and its amendments? Where is it?
- If you have signed off on Guidelines for a particular procedure, have you read the Guidelines?
- Do you know where your Materials Safety Data Sheets (MSDSs) are? Have you had occasion to use them? Were they helpful?
- If you use radioactivity in animal experiments, what precautions do you use?
- Where is your Standard Operating Procedure for this procedure?
- Could you show me how you keep records for animal surgery?
- What sort of training did you have in using animals? Who trained you?
- What kind of safety equipment do you use (e.g. face mask)? What sort of protection does it provide?
- What do you know about the Occupational Health Program? Are you enrolled?
- Do you have allergies to animals?
- Do you know any zoonoses that are associated with the species you use?
- If you do field studies, what kinds of diseases/parasites might be present in these wild animals?

Please discuss the importance of the AAALAC site visit during your lab and department meetings. If you have any questions, please contact the Department of Comparative Medicine and the Veterinary Service Center (VSC) (<http://www.med.stanford.edu/school/CompMed/>)”.

Celebrating America’s Women Physicians

The National Library of Medicine has created an exhibit to celebrate the accomplishments of women in medicine since they first gained entrance to medical school some 150 years ago. As is noted in the curator’s statement “Whether shaping public health policy for whole populations, or providing health care to patients within a small community, women have changed the face of medicine at every level. They have also expanded its scope, often focusing on the needs of underserved populations or the ways in which race and gender affect health and illness. In scientific research, medical practice, and the education of future physicians, women have made important contributions to the health and well-being of us all, around the world. The Exhibition Program at the National Library of Medicine is acknowledging these achievements as well as the struggle to attain them, by commemorating the lives and the work of more than three hundred women physicians from the 19th century to the present day”.

I am pleased to report that two Stanford faculty members are included in the Changing the Face of Medicine exhibit at the NLM. They are:

- **Frances Conley** – who was “the first women ever granted tenure in neurosurgery at a medical school in the United States. At Stanford University she faced great opposition from male colleagues in 1998 and risked her career by publishing an account of sexism at the medical school. Conley had an illustrious and influential career as well as an accomplished life outside of medicine. In 1971, she and her husband were the first husband-and-wife team to run the San Francisco Bay to Breakers 7.8 mile race. Dr. Conley was also the first woman to win”. Dr. Conley is currently retired.
- **Linda Shortliffe**, currently Professor and Chair of the Department of Urology. “Linda Shortliffe’s parents, who as Japanese –Americans had endured discrimination and internment during World War II, encouraged her to pursue a career in medicine so that she would have a financially secure future and a useful, portable career. She followed their advice but took an even more ambitious approach to her work, training in the male-dominated field of urological surgery where, by the time she qualified in 1983, she was one of only fifteen women board certified in the specialty”.

Honors and Awards

- **Dr. Samuel LeBaron**, has received the AAMC Humanism in Medicine Award. Dr. LeBaron, who is trained both as a psychologist and a family practice physician, has been recognized as a compassionate teacher and mentor, a tireless advocate for the underserved, and a role model to his peers. Recruited to develop Stanford medical school's required core clerkship in family and community medicine, he is now the director for the Center of Education in Family and Community Medicine. Under his leadership, the center has made the study of family practice a vital part of both the medical school's curriculum and of the university's academic culture as a whole.
- **Dr. David Spiegel** has been named the 2004 recipient of the Marmor Award and the Marmor Award Lectureship by the American Psychiatric Association. The award honors an individual who has made research contributions that significantly further our understanding of the multifactorial biopsychosocial elements involved in mental health and illness. The award has been given only four times.
- **Dr. Harry B. Greenberg**, the Joseph D. Grant Professor in the School of Medicine, has been elected as a fellow of the American Association for the Advancement of Science for his fundamental studies of the biology of human viruses, particularly for studies of immunity to and pathogenesis of rotaviruses.

Announcement:

SPIRIT Award to be Presented at December 13th Recognition Dinner: The Third Annual School of Medicine SPIRIT Award will be presented to two School of Medicine employees at this week's Dean's Annual Staff Recognition Banquet, Thursday, November 13, 2003. The Award acknowledges two staff members who have been selected for providing outstanding contributions to the mission and vision of the School of Medicine. This year's award winners are: Reese Zasio, Facilities Engineer/Coordinator, Veterinary Service Center, Department of Comparative Medicine, and Valerie Williams, Administrative Associate, Division of Cardiovascular Medicine. The Dean's Annual Staff Recognition Banquet is a wonderful celebration acknowledging the School of Medicine's long-term employees and will be held at the Stanford Faculty Club.

NIH Loan Repayment Programs increase awards by 66%: The NIH reported today that it awarded loan repayment contracts totaling \$63.3 million to 1,200 researchers across the nation in Fiscal Year 2003. This represents a 66% increase in the number of awards over FY 2002, the first year NIH implemented the loan repayment programs nationwide. Loan repayment contracts are competitively awarded to health professionals who commit to engage in qualifying research.

Of those awarded, over half were researchers who completed their doctoral degree within the past five years. In addition, more than half of the awardees hold M.D. degrees; more than a third, Ph.D. degrees; 8%, M.D./Ph.D. degrees; and 5%, other doctoral degrees.

NIH Loan Repayment Programs (LRPs) can repay up to \$35,000 a year of qualified educational debt for health professionals pursuing careers in clinical, pediatric, contraception and infertility, or health disparities research. LRPs also provide coverage for Federal and state tax liabilities. Applicants must have a doctoral-level degree, devote 50% or more of their time to nonprofit- or government-funded research, and have educational debt equaling at least 20% of their institutional base salary. U.S. citizens, permanent residents, or U.S. nationals may apply.

The NIH Loan Repayment Programs are a vital component of our nation's efforts to attract health professionals to research careers in areas of national need. The programs are the Clinical Research LRP, Pediatric Research LRP, Contraception and Infertility Research LRP, Clinical Research for Individuals from Disadvantaged Backgrounds LRP, and Health Disparities Research LRP.

All applications for 2004 awards must be submitted online by December 31, 2003 at 5PM EST. Additional information and the LRP online application is available at www.lrp.nih.gov.

Appointments and Promotions

- ***Jennifer Agramonte*** was appointed to Assistant Professor of Orthopedic Surgery at the Lucile Salter Packard Children's Hospital and at the Stanford University

Medical Center, effective 11/1/2003 to 10/31/2006.

Dean's Newsletter

November 24, 2003

Moving Toward a NCI-Designated Comprehensive Cancer Center

On Saturday November 15th, nearly 100 faculty members from across the University participated in the first planning retreat for our Stanford School of Medicine application to the National Cancer Institute (NCI) to become a Comprehensive Cancer Center. In the October 27th issue of the Dean's Newsletter, I summarized the progress we have been making in assembling the program areas, cores and project leaders. The November 15th Retreat gave me confidence that we will indeed be successful in meeting our October 2004 deadline for submission of the grant proposal to the NCI. I want to thank Dr. Karl Blume, Associate Director of the Cancer/Stem Cell Biology and Medicine Institute for his tireless efforts in crafting the construction of our proposal and for bringing the leaders together to share their developing plans and, perhaps equally important, their excitement and enthusiasm in moving forward. I also want to thank Ms. Sharon Olsen for arranging for the logistics for the Retreat which was held in the new Clark Center.

During the eight-hour Retreat, we reviewed the background plans and requirements for moving forward with the NCI application. Importantly, we heard reviews by faculty who had participated in other NCI Comprehensive Cancer Centers (CCC) about the benefits to junior faculty and trainees of being part of a CCC. Dr. Sam Gambhir, who recently joined Stanford as Professor of Radiology and Director of Molecular Imaging, shared his experiences as a faculty member in the Johnson Cancer Center at UCLA as did Dr. Dean Felcher, Assistant Professor of Medicine, who trained at UCSF during the time that it became an NCI-Designated Comprehensive Cancer Center. We also affirmed that Stanford has had a somewhat jaded history during the past 30 years, having made at least four unsuccessful organizational moves in moving toward applying to the NCI to become a CCC. However, nearly all agree that the current planning efforts feel distinctly different from those of the past and that there is now clear evidence of commitment – from both faculty and leadership – that the time to move forward is now.

The major focus of the Retreat were presentations by Program and Core leaders about their developing plans, including the goals and themes that individual projects are likely to focus on and, perhaps most importantly, how they would foster interdisciplinary programs in research, education and patient care. Indeed clear evidence of intersections and interactions among the various programs became quite evident during the Retreat and I was also very pleased that faculty from Humanities and Sciences and Engineering joined our basic and clinical science faculty in the School of Medicine during this planning Retreat.

Although there may well be changes in the composition or number of Programs and Cores as the planning continues, the current structure of the grant has the following elements:

I Programs in Basic Cancer Research		Program Leader
A	Cancer/Stem Cell Biology	I. Weissman
B	Genomics and Proteomics	P. Brown
C	Radiation Biology and DNA Repair	A. Giaccia
D	Cancer Biology and Cell Cycle	J. Lipsick
E	Cancer Immunology	E. Engleman
F	Cancer Cell and Tissue Imaging	S. Gambir
G	Biomedical Informatics and Biomedical Computation	M. Musen
II Programs in Translational/Clinical Cancer Research		Program Leader
A	Pediatric Cancer	M. Cleary
B	Lymphoma and Hodgkin Disease	R. Levy
C	Hematopoietic Cell Transplantation	R. Negrin
D	Genetics of Epithelial Tumors (Skin, Breast, Lung, GI, GU, GYN)	J. Ford
E	Cancer Pharmacology/Experimental Therapeutics	B. Sikic
III Program in Population Sciences and Education		Program Leader
A	Cancer Epidemiology/Outcome Research/Patient Information-Education/Cancer Control	D. West*

* Dr. West is currently Director of the Northern California Cancer Center. In addition to his responsibilities at NCCC, it is anticipated that Dr. West will join Stanford as a faculty member and that a formal affiliation with NCCC will be officiated.

In addition to these 13 program areas, we are currently anticipating 14 Cores or Shared Resource areas in our application. These are critical components of a CCC and will play an important role in facilitating the research, education and clinical programs. Although there may be changes in the number or composition of the cores as the planning proceeds, those currently being developed include:

IV Shared Resources ("Cores")		Leader
A	Biostatistics	B. Brown/T. Lai
B	Clinical Trials Office	B. Sikic
C	Informatics	H. Lowe
D	General and Specialized Animal Facilities	L. Cork, R. Tolvani
E	Cell and Tissue Distribution	J. Pollack, J. Norton
F	High Throughput DNA Sequencing/SNIPS	R. Davis
G	Cancer Imaging	C. Contag, S. Gambir
H	Confocal and Immunoelectron Microscopy	S. Smith, T. Meyer
I	Flow Cytometry	G. Nolan, L. Herzenberg

J	Hybridomas	M. Cleary
K	Transgenic and Knock-Out Mice	M. Cleary, D. Felsner
L	DNA Microarray Data Base	G. Sherlock
M	Proteomics	P. Jackson
N	Translational/Clinical Research Resources	G. Fisher

Whether you were at the November 15th Retreat or not, if you have an interest in any of these areas please contact the respective Program Leader and let them know of your interest. I am eager for this to be a highly inclusive process – and, of course – for our grant application to be as successful as possible.

During the next several months, Program Leaders and faculty will further refine their plans and we will form an Executive Committee, which will provide oversight over the future planning and help determine the more final composition of the grant application. It is clear that we are still at an early phase of this process. But, it is also clear that we have an outstanding program that we can delineate, hallmarked by incredibly strong science and excellent clinical programs. That said, our application will be made successful through the excitement and commitment of the faculty and program leaders. Based on the Retreat, I now feel confident that we are truly on track! I will keep you apprised of our progress as it evolves in the months ahead.

Faculty Demographics: Progress but More is Needed; Visit by Dr. David Satcher

On Tuesday, November 11th, we reviewed Stanford University's Faculty Affirmative Action Plan with Dr. Pat Jones, Vice Provost for Faculty Development as well as the current demographic status of the School of Medicine in comparison to other Schools in the University and to the national benchmarks delineated by the American Association of Medical Colleges (AAMC). Obviously this is a dynamic process and the data we reviewed was based on a September 1, 2002 snapshot. At that time, the university roster indicated that the School of Medicine had 717 faculty of which 23.6% were women and 18% were underrepresented minorities.

The data for faculty demographics is further broken down by rank and affiliation with basic or clinical science departments. Again using 2002 data, 27.7% of the Stanford basic science faculty were women compared to the AAMC average of 25.5%. At the same time, only 7.4% of the Stanford basic science faculty were underrepresented minorities compared to the AAMC average of 16.8%. Using the same time period, 24.6% of the Stanford clinical faculty were women compared to the AAMC average of 26.6%, and 19.6% of the Stanford clinical faculty were underrepresented minorities compared to the AAMC average of 17.9%.

Although we clearly have a need to make additional progress, it is slightly encouraging that the percentages of faculty at the Assistant Professor rank who are women or underrepresented minorities exceed the AAMC averages in nearly every case. That said, it is our intent to continue to focus our energies on improving the diversity of the School

of Medicine faculty, including the representation of women and underrepresented minorities.

Further focusing our attention on diversity in our education and training programs was the excellent presentation that Dr. David Satcher gave to the School and University community on Tuesday November 18th. Dr Satcher delivered a message about the impact of diversity on the education of all members of the medical or research community and the fact that the kinds of research programs that are addressed can also be influenced by the racial and personal background of trainees and scientists. Dr. Satcher underscored that while we have made strides in attracting students to medical school, we need to do better in graduate education programs. Dr. Satcher is well qualified to address this topic having received his MD and PhD degrees from Case Western Reserve in 1970. He subsequently became a faculty member at Meharry Medical College, where he became President in 1982. In 1994, he became Director of the Centers for Disease Control and Prevention and from 1998 – 2002, he served as Surgeon General of the United States where he had major impact on studies of race and ethnicity. He is currently the director of the National Center for Primary Care Research at Morehouse School of Medicine.

Stanford Medical Student Association (SMSA) Statement on Non-Discrimination Endorsed by Executive Committee

Because of concerns among students at Stanford Law School and other schools around the nation, the SMSA offered the following resolution on November 20th. At our School of Medicine Executive Committee meeting on November 21st, we considered the SMSA statement as well as the broader issues related to non-discrimination. The Executive Committee offers its endorsement of the SMSA resolution that follows:

A Resolution from the Stanford Medical Student Association (SMSA) to Support Stanford Law School's Non-Discrimination Policy

Stanford Law School adheres to a non-discrimination policy that includes sexual orientation in addition to other characteristics such as gender, ethnicity, race and physical disability. Like other law schools, Stanford applies this policy to employer's wishing to recruit students at the law school, meaning that it prohibits employers who do not meet the law school's non-discrimination policy from recruiting on the law school campus. This includes employers such as the US military, who explicitly discriminate on the basis of sexual orientation. Because of this policy, Stanford Law School and all other law schools in the US, are faced with the decision to either grant special exemption to US military recruiters or face the consequence of certain federal funds (with the exception of student financial aid) being withdrawn from the University. This is a direct consequence of a federal statute known as the Solomon Amendment, which permits the withdrawal of certain federal funds from colleges and universities that do not grant military recruiters exemption to policies that prohibit on-campus recruitment by employers that discriminate.

As the Stanford Medical Student Association, we stand by the non-discrimination policy held by the Stanford Law School. As representatives of the School of Medicine student body, we support the Law School should it elect to take legal action to protect its right to apply its non-discrimination policy with regard to discriminatory employers such as the US military. We also urge the administration of the School of Medicine as well as the administration of the entire university to issue similar statements in support of the Law School's efforts to maintain and freely exercise its non-discrimination policy.

Blending Humanities with Science: A Visit from the US Poet Laureate

On Wednesday, November 12th the School of Medicine hosted a noontime poetry reading by US Poet Laureate (2001-2003) Billy Collins to a nearly filled Fairchild Auditorium. A professor of English at Lehman College of the City University of New York, Mr. Collins has become a nationally acclaimed poet, whose works have been published in *The New Yorker*, *The America Scholar* and six collections, including *Questions About Angels*, *The Art of Drowning* and *Picnic Lighting*. His readings were wonderful and clearly reflected the broad interest of our community in both science and the humanities.

I want to thank Helen and Peter Bing whose kind generosity made this visit possible. I also want to thank Dr. Audrey Shafer Associate Professor of Anesthesia and Director of the Medical Humanities Program at Stanford for her wisdom in inviting Mr. Collins to visit the Medical School.

More About the Changing the Face of Medicine

In the November 10th issue of the Dean's Newsletter, I commented on the National Library of Medicine's Exhibit on Women in American Medicine: Changing the Face of Medicine. I am pleased to say that in addition to Drs. Fran Conley and Linda Shortliffe (who I noted in the 11/10/03 issue) I have since learned that four other Stanford faculty members are also listed in the NLM exhibit. What a wonderful tribute to these individuals and to Stanford to have been included in this wonderful exhibit. The additional four individuals and their citations abstracted from the exhibit include:

- **Dr. Helen Hofsommer Glaser** (1924 – 1999): “A respected pediatrician and psychiatrist, Dr. Glaser is best remembered as an effective, supportive, and imaginative editor of *The Pharos*, the journal of the Alpha Omega Alpha Honor Medical Society.

“Born in St. Louis, Missouri, Helen Hofsommer was determined to become a doctor. When she applied to medical school in the early 1940s, a disparaging dean implied that she was displacing a qualified man from a potential career in medicine. But it was wartime in America, and many men who might have studied medicine were abroad, in military service. With the support of her

parents—both doctors—she graduated with a doctor of medicine degree from the Washington University School of Medicine in 1947.

“In a special memorial edition of *The Pharos*, Glaser's colleagues paid tribute to her in poetry and prose. ‘She offered civility in the scientific setting,’ offered Oliver Owen, ‘and used her literary skills to help others advance social progress. Her caring personality and intellectual standards elevated the creativity of students, residents, fellows, young physicians, and old-timers as authors. Her intellect and vibrancy spanned marriage, motherhood, friendship, and career. She enriched the lives of all who knew her.’”

- **Dr. Iris Litt** “Through her work on young women's health issues, Dr. Iris Litt has helped to revolutionize the care of women in prisons and juvenile detention centers. For the past twenty-five years her research has focused on health problems of adolescents, including substance abuse, prevention of pregnancy and sexually transmitted diseases, and most recently, the long-term consequences of eating disorders in adolescent women.

“Born in Brooklyn, New York Iris Litt graduated with a B.A. from Cornell University, and graduated summa cum laude from the State University of New York, Downstate Medical Center, Brooklyn, New York. Dr. Litt was a teaching fellow at Cornell Medical College, then taught pediatrics at Albert Einstein College of Medicine in the Bronx ... and at Montefiore Hospital.

“Since 1976 Dr. Litt has been director of the Division of Adolescent Medicine at Stanford University's Department of Pediatrics, where she is also currently professor of pediatrics and director of the Institute for Research on Women and Gender.

“Among many honors accorded her, Dr. Litt was elected to the Institute of Medicine in 1995, received the annual Outstanding Achievement Award in Adolescent Medicine from the Society for Adolescent Medicine in 1992, and in 1996 was listed in Best Doctors in America. As editor-in-chief of the *Journal of Adolescent Health*, Litt is also a frequent contributor; in a 2002 editorial, she addressed the issue of bioterrorism and adolescents.”

- **Dr. Mary Lake Polan** - “has combined rigorous scientific research with a humanistic clinical approach, in a career spanning women's health, clinical medicine, medical education, and governmental organizations.

“Mary Lake was born in New Mexico in 1943. She obtained her bachelor's degree from Connecticut College, graduating *cum laude* and Phi Beta Kappa in 1965. She earned a Ph.D. in molecular biophysics and biochemistry in 1970, followed by a medical degree in 1975, both from Yale University School of Medicine. After completing her residency at Yale she held a fellowship in

reproductive endocrinology in its department of obstetrics and gynecology. In 2001, after deciding to expand her efforts and research in women's health, Dr. Polan earned a master of public health degree in the Maternal and Child Health Program at the University of California, Berkeley.

Dr. Polan worked and taught at Yale University School of Medicine until 1990, with intervals as a visiting professor in Iran in 1978 and China in 1986. In 1990 she moved to Stanford University School of Medicine, where she has since served as chair of the department of obstetrics and gynecology and as the Katharine Dexter McCormick and Stanley McCormick Memorial Professor.

Dr. Polan has published more than 130 articles, chapters, and books in her areas of research, and in the laboratory at Stanford she focuses on reproductive endocrinology and infertility and, most recently, on gene expression patterns in uterine fibroids (benign tumors).

In recent efforts to help African women in dire need of corrective gynecological procedures, Dr. Polan organized a team of surgical volunteers to travel to East Africa. There, they operated on thirty-seven women in Asmara, Eritrea, to repair the physical damage resulting from prolonged labor during childbirth, a common problem in rural areas. The team hopes to return to help the Eritreans establish a center for gynecological support and patient education at the local hospital.

The National Institutes of Health appointed Dr. Mary Polan co-chair of the Task Force on Opportunities for Research on Women's Health in 1991. From 1995 to 1998 she was also a member of the Director's Panel on Clinical Research. Dr. Polan was elected to the Institute of Medicine in 1993 and will serve on its Governing Council through 2005. At the request of Tommy Thompson, Secretary of the Department of Health and Human Services, Dr. Polan serves as one of eleven members of the Secretary's Advisory Committee on Human Research Protections through 2006. The committee will be asked to advise on the responsible conduct of research involving human subjects. Dr. Polan also serves on numerous other medical and health committees, including the American Society for Reproductive Medicine and the American Medical Women's Association. She is a fellow of the American College of Obstetrics and Gynecology and a member of many professional societies.”

- ***Judith Lea Swain, M.D.*** “a specialist in cardiology ... Dr. Swain works in many areas of medicine, from research to invention, publishing to hospital administration, professional consulting to academic leadership, and mentoring others in the development of their medical careers.

“When she first decided to become a physician as a junior high school student, Judith Swain's goal was more general, to combine her love of science with helping people. Born in Long Beach, California, in 1948, Judith earned her Bachelor of Science degree in chemistry at the University of California, Los

Angeles in 1970. She earned her doctor of medicine degree at the University of California, San Diego, in 1974, and went on for her internship and residency at the Duke University Medical Center in Durham, North Carolina, where she later held fellowships in cardiovascular research and clinical cardiology. In 1979 she joined the faculty at Duke, where she stayed until 1991. While there, she became widely known in the field of molecular cardiology and pioneered the use of transgenic animals to understand the genetic basis of cardiovascular development and disease.

“From 1991 to 1996 she was the Herbert C. Rohrer Professor of Medical Sciences at the University of Pennsylvania, where she was a professor of genetics and member of the molecular biology graduate group. In 1997 Dr. Swain became the Arthur L. Bloomfield Professor of Medicine and chair of the Department of Medicine at Stanford University School of Medicine. Dr. Swain has had major research grant support ... from a number of grant funding agencies, including the National Institutes of Health (NIH), from whom she has received research funding for the past 20 years

“Dr. Swain holds several patents, including two patents for methods of increasing the energy metabolism of heart and skeletal muscle, and one for a method of identifying patients at risk for heart failure. She has published more than sixty articles and book chapters in the field of cardiology.

“Dr. Swain has been elected to a number of honorary societies, including the Association of American Physicians, the American Society for Clinical Investigation, the Association of University Cardiologists, the American Clinical and Climatological Society, and the Institute of Medicine.”

Some Reflections on the Annual Staff Recognition Dinner

It was a great pleasure to attend the Annual Staff Recognition Dinner Banquet that was held in the Stanford Faculty Club on Thursday, November 14th. Although I now have been at Stanford just over 2 ½ years, this was the third such event I participated in – and each has left wonderful memories. Perhaps foremost is the clear commitment and dedication of the individuals who comprise the Stanford Medical community. During the dinner, I had the opportunity to visit (albeit briefly) with nearly all of the individuals celebrating their service to the School of Medicine (from staff who have been here for 5 years to individuals who have given over 35 years of service). While each surely has an important personal story and history, a unifying theme was the overall satisfaction that our staff appears to have by being part of our School of Medicine community. I have no doubt that each individual faces significant challenges in her or his workplace, but I am pleased to know that each values what the School stands for – and what it is trying to accomplish. There is no doubt that whatever success we may achieve in reaching our goals and Strategic Initiatives (<http://medstrategicplan.stanford.edu/>) is closely aligned to the many contributions that each member of our community plays on a day-to-day and year-to-year basis.

Recognizing that each individual employee is important, it is also a pleasure to pay special homage to those who have won this year's SPIRIT Award as well as those who have served the School of Medicine for more than two decades. The SPIRIT Award (Service Orientation, Positive attitude, Initiative, Resourcefulness/reliability, Innovation, and contributing as a Team Player) is presented to two staff members who have been selected for providing outstanding contributions to the mission and vision of the School of Medicine. This year's recipients of the SPIRIT Award are:

- **Valerie Williams**, Administrative Associate, Division of Cardiovascular Medicine, Department of Medicine and
- **Reese Zasio**, Facilities Engineer/Coordinator, Veterinary Service Center, Department of Comparative Medicine.

Please join me in congratulating Ms. Williams and Mr. Zasio.

In addition, I am pleased to list the names of those who have served the School of Medicine for more than twenty years. They include:

<i>20-Year Employees:</i>	<i>25 Year Employees</i>	<i>30-Year Employees:</i>	<i>35- Year Employees:</i>
Bonita Baker	Claudia Benike	Miguel Alvarez	Annie Chang
Denise Cline	Inna Bilis	Roger Baldwin	Libuse Jerabek
John Dorman	Kristina Blouch	Karen Carpenter	Linda Lan
Ellen Fitzpatrick	Mary Buttner	Sandra Conlon	Norma Malimban
Humberto Garcia	Butch Colyear	Ronald Garcia	Orlando Rojas
Susan Marie Gokey	Caroline Constantz	Jerry Halpern	Carol Sweeney
Gonzalez			
Diane Howard	Rebecca Green	Anne Klause	
Carol Kersten	Irene Renee Grys	Sheryl Pask	
Tim Knaak	Cheryl Joo	Alma Quintos	
Doreen Leith	Lisa Ma	Glenda Riddley	
Eileen Maisen	Susie Mitchell	Fae Sloss	
Patricia McAfee	Pauline Worrell	Susan Sith	
Mark McLaughlin			
Dick Miller			
Punaotala Opeta			
David Profitt			
Audrey Pullens			
Robert Schneeveis			
CarielTaylor-Edwards			
Birgit Walker			
Belinda Rosales-Webb			
Phuoc Vo			

I again want to add my thanks and appreciation to all our employees – but in particular those who have served the School and University for extended periods of service. Thank you.

Update from the Executive Committee: Report from Molecular and Cellular Physiology

At the November 7th meeting of the Executive Committee, Dr. Rick Aldrich, Chair of the Department of Molecular and Cellular Physiology, presented an in-depth look at the faculty, students, teaching, and research activities of the department. He provided a history of the department's faculty as well as its trainees, from its establishment in 1988 to the present. The department currently has eleven faculty. Over the course of its existence, the department has trained 42 graduate students and 119 postdoctoral fellows, who, among them, hold positions at 42 U.S. and 17 international academic institutions and some 26 companies. In addition to a full complement of courses taught on campus, MCP faculty have taught at the Marine Biological Laboratory at Woods Hole, Cold Spring Harbor Laboratory, SSRL, and the Society of Neuroscience Short Courses.

The research activities in the department are multi-disciplinary and show a high degree of collaboration among faculty. The physiological systems being studied include: nervous and sensory, cardiovascular, endocrine, renal, gastrointestinal, immune, and epithelial biology. Among the specific topics in cellular biology being investigated are cell shape, motility, and interactions; membrane and membrane protein trafficking; membrane protein structure and function; ion channels, receptors, and electrical signaling; synaptic transmission and plasticity; and calcium signaling. Methodologies employed include spectroscopy and imaging, single molecule biophysics, and electrophysiology.

Dr. Aldrich emphasized that the faculty in the department also have a large number of collaborations with faculty in other departments and schools at Stanford. Discussion following the presentation focused on the importance of such collaborations. One chair commented that the environment is crucial for either encouraging or discouraging collaborative work, and the suggestion was made that mechanisms for making collaborations easier and more efficient be explored.

Thanks to Dr. Aldrich for his fine presentation and to all the faculty, staff, and students in the department for their many scientific and institutional contributions.

Update from the Medical School Faculty Senate

At the November 19th meeting of the Faculty Senate, special homage was paid to Drs. Sam LeBaron and Kelly Skeff for the important national awards they received respectfully for compassion in medicine and mentoring. This served as an opportunity for the Senate to focus on the importance of humanism in medicine – and for a culture that fosters professionalism. Dr. Oscar Salvatierra, Chair of the Senate, stated that professionalism will be among the highest priorities of the Senate. I am very pleased with this decision and the Dean's Office will do everything it can to work closely with the Faculty Senate to fulfill this goal.

Professionalism: The following statement on professionalism adapted from statements of the American Boards of Internal Medicine and of Pediatrics was adopted by the Medical School Faculty Senate at its June, 2002 meeting as a preliminary guideline:

Professionalism comprises those attributes and behaviors that serve to maintain patient interests above physician self-interest. Professionalism extends beyond interactions with patients and their families, however. Professionalism also involves relationships and interactions between all those involved in medical education and the delivery of patient care including physicians, students, administrators, and allied health professionals. It has implications for research activities and interactions with for-profit companies, governmental agencies, and other outside entities. Professionalism should pervade all of our activities in medicine and should include:

- A commitment to the highest standards of excellence in the practice of medicine and in the generation and dissemination of knowledge.
- A commitment to sustain the interests and welfare of patients.
- A commitment to be responsive to the health needs of society.

The elements of professionalism include altruism, accountability, responsibility, excellence, duty, honesty, integrity, and respect for others. Physicians, students of medicine, and all staff participating in medical student education and patient care at Stanford University School of Medicine are expected to aspire to these ideals, further defined as:

Altruism is the unselfish regard for and devotion to the welfare of others and is a key element of professionalism. Self-interest or the interests of other parties should not interfere with the care of one's patients and their families.

Accountability and responsibility are required at many levels – individual patients, society and the profession. First there must be accountability to one's patients and to their families. There must also be accountability to society for addressing the health needs of the public and to ensure that the public's needs are addressed. One must also be accountable to the profession to ensure that the ethical precepts of practice are upheld. Inherent in responsibility is reliability in completing assigned duties or fulfilling commitments. There must also be a willingness to accept responsibility for errors.

Excellence entails a conscientious effort to exceed ordinary expectations and to make a commitment to life-long learning. Commitment to excellence is an acknowledged goal for all physicians and students of medicine. A key to excellence is the pursuit of and commitment to providing the highest quality of health care through lifelong learning, education, and reflection. One must seek to learn from errors and aspire to excellence through self-evaluation and acceptance of the critiques of others.

Duty is the free acceptance of a commitment to service. This commitment entails being available and responsive when “on call,” accepting inconvenience to meet the need of one’s patients, enduring unavoidable risks to oneself when a patient’s welfare is at stake, advocating the best possible care regardless of ability to pay, seeking active roles in professional organizations, and volunteering one’s skills and expertise for the welfare of the community.

Honesty and integrity are the consistent regard for the highest standards of behavior and the refusal to violate one’s personal and professional codes. Honesty and integrity imply being fair, being truthful, keeping one’s word, meeting commitments, and being forthright in interactions with patients, peers, and in all professional work, whether through documentation, personal communication, presentations, research, or other aspects of interaction. They require awareness of situations that may result in conflict of interest or that result in personal gain at the expense of the best interest of the patient.

Respect for others is the essence of humanism, and humanism is central to professionalism. This respect extends to all spheres of contact, including but not limited to patients, families, other physicians, and professional colleagues, including nurses, residents, fellows, and medical students. One must treat all persons with respect and regard for their individual worth and dignity. One must listen attentively and respond humanely to the concerns of patients and family members. Appropriate empathy for and relief of pain, discomfort, and anxiety should be part of the daily practice of medicine. One must be fair and nondiscriminatory and be aware of emotional, personal, family, and cultural influences on patient well-being and patients’ rights and choices of medical care. It is also a professional obligation to respect appropriate patient confidentiality.

Thanks and Farewell to Ms. Michael Cowan

After 29 years at Stanford, Michael Cowan, Associate Dean for Postdoctoral Affairs, retired last week. Ms. Cowan began her career in the Bursar's office in 1974 and became Director of Financial Aid for the medical school in 1975. She worked with deans Lawrence Crowley, Dominick Purpura, David Korn and Eugene Bauer in a variety of roles. Michael is widely recognized for her initiatives on behalf of women students and women faculty. She was the recipient of the Kenneth M. Cuthbertson Award for Exceptional Service to Stanford University in 1997.

In the Fall of 2000, Michael was appointed to her most recent position, creating the first university-wide office for postdoctoral scholars in the country. She was a tireless advocate for that group and helped them achieve many gains and much-deserved recognition both at Stanford and nationally.

Please join me in wishing her well.

Awards and Honors

- Dr. Hal Holman, Berthold and Belle N. Guggenhime Professor of Medicine, has been named the recipient of the John Phillips Memorial Award for Outstanding Work in Clinical Medicine by the American College of Physicians.
- Dr. Kelly Skeff, George DeForest Barnett Professor in Medicine, has been elected to Mastership in the American College of Physicians.

Announcements

Community Faculty Lecture Series: On Wednesday evening, December 3rd at 7:00 p.m., the next lecture in our series of Community Faculty Lectures will be held in the Clark Center Auditorium and will address “What the Owl Can Teach Us About the Brain” by Dr. Eric Knudsen, Chair of the Department of Neurobiology. One of the most fascinating properties of the brain is its ability to learn. Dr. Knudsen will discuss his studies in barn owls that have shown how experience during early life, learning in small increments, and high levels of attention can increase the capacity for learning in the adult brain.

Appointments and Promotions

- **Timothy Angelotti** has been reappointed to Assistant Professor of Anesthesia at the Stanford University Medical Center, 8/1/2004 to 7/31/2007.
- **Julie Baker** has been reappointed to Assistant Professor of Genetics, effective 2/1/2004 to 1/31/2007.
- **Catherine Beckwith** has been reappointed to Assistant Professor of Comparative Medicine at the Stanford University Medical Center, effective 12/16/2003 to 12/15/2005.
- **John Chow** has been reappointed to Assistant Professor of Anesthesia at the Stanford University Medical Center, effective 7/1/2004 to 6/30/2007.
- **Robert Jackler** was appointed to Professor of Otolaryngology and, by courtesy, of Neurosurgery and of Surgery, effective 12/1/2003.
- **David Magnus** was appointed to Associate Professor (Teaching) of Pediatrics and, by courtesy, of Medicine, effective 12/1/2003 to 11/30/2009.
- **Marcia Stefanick** was promoted to Professor (Research) of Medicine and, by courtesy, of Obstetrics and Gynecology, effective 12/1/2003 to 11/30/2009.
- **Richard Shaw** has been promoted to Associate Professor of Psychiatry and Behavioral Sciences and Associate Professor, by courtesy of Pediatrics at the Stanford University Medical Center, effective 12/1/2003 to 11/30/2008.
- **Keith Stockerl-Goldstein** has been promoted to Associate Professor of Medicine at the Stanford University Medical Center, effective 12/1/2003 to 11/30/2008.

Dean's Newsletter

December 8, 2003

Holiday Season: Time for Reflection

The interval between Thanksgiving and Christmas and Hanukah can be filled with festivity and joy as well as stress and disillusionment. It is a season when families come together for celebration or seem to recognize their distance and separation. For many it is time for heightened spirituality whereas for others it is simply a moment of commercial opportunity or secular frivolity. Regardless of where one is on the spectrum, as one year folds into the next, it is also a time for reflection.

It is often all too easy to slip into the daily pace of life's journey. But for those of us in science, medicine and health care, I believe it is important to try to rise to a higher level. Most of us are fortunate in being able to do work that is not a "job" but rather something that we care deeply about – and that can impact the world in important and positive ways. Even so, the demands and stresses that determine our behavior – either because of internal expectations or external demands – can easily mute any sense of fulfillment that would otherwise be readily apparent.

We are fortunate in being part of an exceptional community and university. You and your colleagues have made great strides in developing an agenda for the School of Medicine and in helping many of its novel facets to unfold. We are surrounded by a constant array of exceptional and remarkable discoveries and insights in the biosciences as well as innovations in patient care and treatment. Of course we are also sometimes frustrated by the slow pace of our research, the lack of respect for our accomplishments and the many pressures that are imposed – often making us feel that we need to do more with less. Naturally it is easy to lose perspective. Compared to much of the world, we are blessed – although vulnerable to letting our isolation and seemingly increasing national arrogance confound our position as a member of a global community. We focus on important research questions and diseases that impact our population. But we pay less attention to questions that impact less developed populations and focus even less on the study of diseases or issues of social justice that affect the majority of the world's population.

As global health becomes an even bigger issue and concern, it is important to ask what role we should play in the years ahead. Certainly we already have a number of our faculty and students who are interested in or committed to global health issues – but we are still a relatively minor player on the world scene. The question of whether we should change that dynamic – and how – is worth pondering and reflecting on. As a small research-intensive school of medicine, we must make choices since we simply cannot do everything we might like – or others may wish we could or should do. But we do need to pause from time to time and reflect on whether we are addressing the most important questions, focusing on the most significant diseases and having the greatest impact we can on our community – locally, nationally and globally. It is worth some thought – and I am interested in learning what you think. Please do let me know.

Appointment of New Director for Communications and Public Affairs

I am very pleased to announce that Mr. Paul Costello has agreed to join us as our new Director of Communications and Public Affairs. Mr. Costello was selected after an extensive national search and will join Stanford officially on January 6th. He comes from the University of Hawaii where he was the Vice President for External Affairs and University Relations and where he supervised media relations, government relations, marketing and special events.

I believe that Mr. Costello is uniquely qualified for his new position based on his extensive and highly variegated professional career. He previously served as spokesperson for Rosalynn Carter and Kitty Dukakis and was press secretary for Ohio Governor Richard Celeste. He also served as vice president of public affairs for HBO. In addition, he has held important management positions at a number of leading public relations firms including Ogilvy, Adams and Rinehart in Washington, D.C.; Edelman Worldwide in Washington, D.C.; Hill & Knowlton in Chicago; and Weber Shandwick International in New York, where his clients included health and biotechnology leaders.

Mr. Costello's experience with media and public relations is enormously important to our agenda for the School of Medicine. There is little question that one of our most significant challenges is communicating the importance and value of academic medical centers like Stanford to local and national audiences. While there is a significant level of appreciation for the importance of biomedical research by the American public, there is less value assigned to the importance of teaching hospitals and the role that academic medical centers play in improving the health of our communities and nation. The important linkage between basic research and clinical medicine – and the role that our academic medical centers play in translating knowledge from the laboratory to the bedside – are less clearly appreciated. As the costs for health care continue to rise and the burden of financial responsibility increasingly shifts to the consumer, it is ever more important for the public to appreciate the role that biomedical and translational research plays in the lives of families now and into the future. It is essential that Stanford assume a leading role in crafting this message to the public based upon its mission and contributions codified in our Strategic Plan "*Translating Discoveries*" (<http://medstrategicplan.stanford.edu/>). To accomplish the goal of enhancing our communication agenda, we will surely benefit from the expertise of Mr. Costello. I am very pleased to welcome him to our community and leadership team.

Lucile Packard Children's Hospital "Gift" to the School to Recognize the Contributions of Faculty and Medical Staff.

This past year the Lucile Packard Children's Hospital continued to demonstrate significant growth in its clinical programs as well as further enhancement of research and education initiatives. Based on this significant progress, Mr. Chris Dawes, President and CEO of LPCH, recommended to the Hospital's Board of Directors that a 4 million dollar "gift" be made to the School of Medicine to acknowledge the important contributions of the faculty who played a role in facilitating these important successes.

Based on discussions with Hospital leadership as well as input from a subcommittee that included Drs. Harvey Cohen, Ken Cox and Tom Krummel along with Mike Hindery and Marcia Cohen, a plan was developed to distribute these funds to faculty and departments. Based on those discussions, Clinical Department Chairs and DFA's were notified about the plan on December 2nd.

You may recall that when the gift was first announced, we elected to use \$700,000 to fund a new biotechnology core as part of the Children's Health Initiative – but with the recognition that this will have a broader applicability. The remaining \$3.3 million is being distributed to faculty and staff physicians across the school who have cared for pediatric patients or played an important role in pediatric academic program development. A portion of these funds will also be allocated to the newly formed Pediatric/Obstetric Faculty Practice Organization to support and incentivize improved patient care service at LPCH.

The School appreciates the recognition by the LPCH leadership of the important efforts of our pediatric physicians and faculty in improving the status of the care for children and the research and training that will assure that additional improvements continue to occur in the years ahead. This is an excellent demonstration of how one institution can demonstrate its respect and value for a critical partner within our academic medical center.

Pediatric Research Equity Act of 2003 Becomes Law

December 3rd was historic day for pediatric research. On that day, President Bush signed into law the Pediatric Research Equity Act of 2003 (S.650/H.R. 2857) which restored the protections provided by the Food and Drug Administration's (FDA) 1998 Pediatric Rule. The Pediatric Rule requires drug companies to test products for use in children.

As an investigator working on life-threatening pediatric diseases, I was constantly battling the lack of availability of drugs that could be tested in children with AIDS – even though they were being developed and tested in adults. In the late 1980's and early 1990's, more than 75% of drugs had never been tested in children and suitable formulations had not been developed. You can imagine the frustration and disappointment of parents who were able to receive a drug for themselves – but not for their child with the same disease.

In view of this challenge, I and a number of pediatric investigators began seeking ways of developing mechanisms to assure that drugs would be tested in children - and that the FDA would set that expectation. In the late 1980's, I began working with Elizabeth Glaser, a pioneering advocate for children and pediatric research, and with the Foundation that still carries her name. Although it has taken nearly 15 years, the Elizabeth Glaser Pediatric AIDS Foundation (I serve as the Vice Chair of the Board of Directors) has tenaciously pursued the Pediatric Rule – and that was challenged – as well as the legislation that would make it the law. We have been helped in these efforts by

many pediatric leaders and advocates around the country. Perhaps among the most important has been Congresswoman Anna Eschoo (D-CA), who co-sponsored the legislation to make the passage of the Research Equity Act of 2003. I also want to thank Dr. Harvey Cohen, Chair of Pediatrics, for his important leadership.

Hopefully the Research Equity Act will now assure that children will benefit from new drugs being developed to treat serious disease. Specifically, the Pediatric Research Equity Act of 2003 gives the FDA the authority to mandate that drug companies test the safety and dosing of all new medications for children – as well as some that have already been marketed but not yet tested in children.

The Respectful Workplace: Update and Future Plans

Beginning in the spring of 2002 and through July 2003, all departments participated in a program on the Respectful Workplace, underscoring our commitment to assure that we do everything possible to provide a work environment that values the integrity and respect for our employees throughout the School of Medicine. These departmental programs included the participation by staff and faculty from the Human Resources Group, the Dean's Office, Ombudsman and Legal Office (Cori Bossenberry, Ellen Waxman, David Stevenson, Roy King, Normal Leavitt, Martha McKee, Tom Fenner, Melissa Burke and Greta Schnetzler). Some 28 briefings were held that were attended by over 600 faculty.

The sessions on the Respectful Workplace addressed a number of important issues, including:

- The School's Respectful Workplace statement;
- the law regarding sexual harassment as well as other forms of harassment, discrimination and retaliation;
- Stanford's policy on consensual sexual or romantic relationships;
- the important role of faculty as managers and how they should respond to concerns that are raised in the workplace;
- the resources within the School and University to address any concerns or issues that are raised by faculty, staff or students within the workplace including advice for responding to concerns that involve potential legal liability for the university.

Overall, the initial evaluation of these sessions is that they provided a strong beginning to assuring that we achieve and sustain a Respectful Workplace within the School of Medicine. It was generally felt that these sessions provided important information and resource awareness to faculty. However, there still remains considerable skepticism about how committed we are to assuring that a truly Respectful Workplace is fully achieved. I want to make clear that this is among my very highest priorities for the School and that we will do all that we can to work with HR and our legal office to make it an ongoing reality.

It is our intent to continue briefings of departments and members of our community in order to maintain a heightened awareness to the goals of a Respectful Workplace. It is

also my intent to vigorously pursue any violations of the respectful workplace and to do all that we can to serve our community. Should you have any concerns that you feel need to be expressed, I want to assure you that you may do so confidentially. Please feel free to bring your concerns to Martha McKee (Ombudsperson), Ellen Waxman (Director of Faculty Relations) or David Stevenson (Senior Associate Dean for Academic Affairs).

Faculty Senate Approves the Degree Granting Authority of the Department of Bioengineering

On Thursday, December 4th, the University Faculty Senate reviewed the proposal from our newly formed joint Department of Bioengineering (between the Schools of Engineering and Medicine) to launch its degree-granting program for graduate studies. Drs. Scott Delp, Chair and Paul Yock, Co-Chair, did a wonderful job in addressing the Senate and providing the goals of the graduate studies program and its initial formulation. In a historic vote, the Senate unanimously approved the following resolution:

The Committee on Graduate Studies recommends that the Senate authorize the Department of Bioengineering to admit candidates for the Master of Science and the Doctor of Philosophy degrees, with enrollment beginning in the Autumn Quarter of 2004-2005, and to nominate candidates for the M.S. and Ph.D. degrees in Bioengineering, without limit of time.

As you may recall, the plans to proceed with a petition to pursue a joint Department of Bioengineering were resolved between the Schools of Engineering and Medicine in November 2001 and, based on that, achieved approval from the University's Board of Trustees in June 2002. Since then, Drs. Delp and Yock have made significant progress in delineating the educational, research and administrative foundations of the department. The approval of degree granting authority by the Senate is testimony to the important leadership they have provided. The next several years will prove exciting for the new department and will include the recruitment of faculty, the enrollment of graduate students in 2004 and undergraduate students (likely in 2006) and new research facilities as part of the Science, Engineering, Medicine Campus (SEMC) development now underway.

Update from the Executive Committee: The Matter of Joint Academic Appointments

At the Executive Committee on Friday, December 5th, the topic of joint appointments between departments was considered and discussed. At Stanford it is not uncommon for faculty to have a primary appointment in one department and a secondary and/or courtesy appointment in another department. In the School of Medicine, approximately 23 of our 99 faculty in basic science departments have a joint appointment in another department. Of these, 15 are in another basic science department and 8 are in clinical departments. Among our 641 clinical science faculty, 49 have joint appointments, 25 of which are in a basic science department and 24 in other clinical departments. In our School a secondary

appointment does not require a split of a billet unlike other Schools (e.g., Engineering) where a joint appointment means that a billet is shared between two departments.

We do not have any official position on joint appointments since they are largely determined by the desires and needs of individual faculty and departments. However, it is appropriate to review how joint appointments might be helpful to the School and its mission, and whether we should be more proactive in fostering such appointments. Certainly it seems clear that joint appointments can foster increased interaction among faculty, students and postdoctoral trainees and enhance interdisciplinary. Joint appointments offer opportunities for more diverse mentoring of faculty and trainees as well as greater opportunities for training grants or program project grant applications. For the individual faculty member, a joint appointment may provide evidence of greater prestige and accomplishment. Importantly, joint appointments shared between basic and clinical science departments can help to foster more opportunities to promote translational research or to better inform basic science faculty about challenges in clinical medicine and vice versa. At the same time, it is important to take into account that too many joint departments can sometimes be seen as diluting the focus of a department or might create greater competition for training grant slots or even graduate students. A practical but real concern is that if a small department has too many joint appointees it might impact on the overall decision making of the department, especially regarding faculty appointments and promotions since individuals with secondary appointments have similar voting rights and privileges to those with primary appointments.

We had a very thoughtful discussion of these issues at the Executive Committee. From my perspective, joint appointments must be driven by the convergence of the scientific contributions of a faculty member and the goals and directions of a department. This cannot be a top-down process but must be determined between departments and faculty. That said, it is appropriate to explore ways to further facilitate a culture in which joint appointments are further sought and valued and, based on the content of the discussion we had at the Executive Committee, this is a topic we will pursue as an important agenda item for the School during the months ahead.

Community Lecture Series Continues to Draw Crowds

On Wednesday December 3rd, Dr. Eric Knudsen, Edward C. and Amy H. Sewall Professor and Chair of the Department of Neurobiology, gave another in the very successful series of “Community Lectures” that commenced this Fall. Dr. Knudsen spoke about learning and brain plasticity using studies focused on auditory and visual learning patterns in barn owls. It was a wonderfully informative presentation that was clearly interesting to the audience

Dr. Mark Hlatky, Professor, Department of Health Research and Policy and Dr. Laurence Baker, Associate Professor, Department of Health Research and Policy will deliver the next lecture entitled: *Medical Innovation, Rising Costs and the Health of the Public* on Wednesday, January 7, 2004 at 7 p.m. in the Clark Center Auditorium.

Announcement

The First Edward Rubenstein Lecture will be held on Tuesday, January 6, 2004 at 5:10 pm in the Fairchild Auditorium. J. Michael Bishop, M.D., a 1989 Nobel Laureate and Chancellor at the University of California, San Francisco will deliver the first lecture which is entitled “How to Win the Nobel Prize: An Unexpected Life in Science.”

Dr. Bishop, a microbiologist, shared the 1989 Nobel Prize in Physiology and Medicine for his discovery of the cellular origin of retroviral oncogenes and the identification of the genes that control the normal growth and division of cells. This lecture is named in honor of Edward Rubenstein, MD, associate dean of postgraduate medical education and professor of medicine emeritus, who is noted for developing innovative training programs for practicing physicians and his collaborative research with faculty in chemistry and physics.

This lecture has been made possible by a generous endowment from the Thomas G. and Martha Lee Parker Charitable Fund. A reception will follow. Please RSVP by Friday, January 2, by contacting 650-234-0625 or vanny@stanford.edu

Dean's Newsletter January 5, 2004

A New Year

I hope that you and your family and friends had a lovely holiday and I wish you the very best for the New Year. We each approach holidays and related sentinel events – like the New Year – with some excitement and trepidation. It is, of course, a traditional moment for reflection as well as resolution – often from the microcosm of the individual. I approach the New Year not only with a personal perspective but also with a broader institutional one. How have we fared at Stanford School of Medicine in these times of dramatic change in biomedical science and health care delivery? Have we been able to fulfill some or most of the objectives we cast as part of our Strategic Planning Process nearly two years ago? And, equally importantly, what remains to be done – both for this next year and those that follow?

In this first Dean's Newsletter of 2004, I will attempt to summarize some of the accomplishments of 2003 from the larger perspective of the School of Medicine. Naturally, this summary will be at a very high level and many details are being omitted. Also, there are hundreds and thousands of accomplishments that have been made individually by our faculty, students and staff – many that may be more important and meaningful than those listed below - that are not included in this overall summary. I certainly commend and praise those individual achievements – and value each of them tremendously for what they bring to our Stanford community. But for this moment, I will reflect on how the School – as a whole – has met some of the goals that we established in our Strategic Plan “*Translating Discoveries*” (<http://medstrategicplan.stanford.edu/>). Hopefully this will help further define the tasks that lie ahead.

I especially want to thank each of you for the tremendous efforts and support you have provided. I am cognizant that come April 2004, I will have been a member of the Stanford community for three years – and can longer view myself as “new”. But it is my hope that we can agree that, in the time we have worked together, we have made tangible progress in a number of important areas – thanks to your commitment and leadership. We also have lots to do however, and I very much look forward to continuing our work together in 2004 and in the years to come.

Happy New Year.

What We Accomplished in 2003

In 2003, we continued to implement the initiatives we developed through our Strategic Planning Process that are defined under the banner of *Translating Discoveries* (<http://medstrategicplan.stanford.edu/>). These are linked to our key missions in education, research and patient care and are aligned to the mission statement we developed in 2001 at the launch of our planning efforts. To remind you: ***The mission of the Stanford University School of Medicine is to be a premier research-intensive medical school that improves health in the 21st century through our discoveries, leadership and innovations in education, biomedical and clinical research and patient care.***

The past year heralded a number of notable accomplishments in our three mission areas of education, research and patient care, and also in the school’s various support functions.

EDUCATION

Following our First Strategic Planning Retreat in February 2002, we engaged in a thoughtful collaboration with the Dean’s Office, Medical School Faculty Senate and numerous students, faculty and staff to develop the New Stanford Curriculum. In what must surely be record time, we moved from concept to implementation such that the New Stanford Curriculum was initiated with the incoming class in the Fall of 2003! This represents a true innovation in the structure and content of the medical curriculum marked by the realignment of didactic and clinical experiences, the initiation of eight new Scholarly Concentrations, and the integration of simulation and other learning technologies within the education and learning process.

The New Stanford Curriculum is already generating a great deal of interest across the country and a number of Schools, including UCSF and Harvard, are considering introducing portions of it in their own curriculum planning efforts. Although we have made considerable strides during the 18-month planning and implementation cycle, it is important to consider curriculum change as a work in-progress. Indeed, I doubt that we ever will (or should) be done with this process – since advances in science and care delivery mandate continued change and flexibility in our education programs. In order to help guide current and future changes, we are committed to an on-going analytical review of the New Stanford Curriculum and its impact on our students, faculty and staff. During

the next year and those that follow I anticipate there will be numerous reports on the evaluation of the changes we have already made – and those that are yet to be introduced.

While it is appropriate that our initial attention has focused on medical student education, we recognize that the training of physicians and physician-scientists often extends 6-8 years beyond graduation from medical school and must, of course, be accompanied by a commitment to life-time learning. Accordingly, we believe that there is an opportunity to link more linearly the education of medical students, residents and fellows and to develop more contiguity of scholarship and career development. Indeed, the future training of physician-scientists, scholars and leaders – one of our primary goals – would benefit from closer linkage between undergraduate and graduate medical education. In many ways, the New Stanford Curriculum, and especially the Scholarly Concentrations, offer the opportunity to extend the medical curriculum into postgraduate training. As an initial step towards this goal, a committee co-chaired by Larry Shuer and Charles Prober that was appointed in 2003 undertook a thorough assessment of the programmatic and organizational structures affecting the quality of our Graduate Medical Education and Postgraduate Medical Education programs. The implementation of the committee's recommendations in 2004 and beyond will enable the Medical School and the Medical Center to undertake a more complete integration of all our medical education programs.

Through our Scholarly Concentrations we are reinforcing the value of a strong biosciences program within medical education. Similarly, we believe that an orientation and exposure to human health and disease will strengthen our biosciences graduate programs and further the school's mission in translating discoveries. Accordingly, in 2003 we moved closer toward this goal through a number of collaborative initiatives including new courses in the Cancer Biology and Neurosciences Graduate Programs that focus on disease mechanisms, histology, and physiology for Biosciences students. A task force to explore ways of exposing graduate students to medicine has met and produced a set of exciting recommendations for true innovation in this area that will be addressed in 2004.

During 2003 the School of Medicine has worked closely with University leaders to further define the planned Stanford Medicine Information and Learning Environment (SMILE). We are confident now that we can pursue a SMILE project that will finally bring together a new knowledge center and the shared teaching facilities of our various educational programs in an environment that is as innovative and interactive as the programs themselves. Although the exact timing for the completion of the project remains undefined (and, of course, is dependent on raising the necessary dollars to support it) we are currently aiming for the opening of SMILE by 2008.

The extensive reformation and reorientation of our medical and graduate teaching programs has been a major initiative of the School. The steps we have taken in 2003 are truly significant – as has been the enormous collaboration and cooperation that has fostered and enabled them. Our ultimate success will depend on our continued commitment to long-term change across the entire continuum of education that includes medical and graduate students as well as postdoctoral trainees – and to the career paths

that our graduates assume in the future. These will be carefully monitored in order to assure that we optimize the success of future Stanford trained physicians and scientists.

RESEARCH

The essential underpinning of our research mission is our commitment to high quality basic and clinical research. The contributions of Stanford faculty during the past decades to new discoveries in the biosciences have been breathtaking, and have contributed, in no small part, to the transformation of medical science as we currently know it. There is no question that current applications to the diagnosis, treatment and prevention of human disease are built upon the fundamental discoveries emanating from investigator-initiated research and discovery. Without question, continuing to support and value basic research must be among our highest institutional priorities – since it will cast the future of medical science for the years and decades to come. At the same time, seeking ways to capitalize on discoveries – and to translate them into applications that improves the lives of adults and children – is also one of our highest priorities. It is indeed the umbrella for our overall strategic plan entitled *Translating Discoveries*.

In our planning process we determined that establishing the Stanford Institutes of Medicine would provide a mechanism to link basic and clinical research to clinical application in a small number of focused thematic areas. The Stanford Institutes of Medicine align the missions of the School with those Stanford Hospital & Clinics and the Lucile Packard Children's Hospital. We chose four areas where we have institutional expertise and where we believe important opportunities for basic research as well as clinical research and patient care exist. Ideally, the Stanford Institutes of Medicine will foster bi-directional translational research, bringing applications from the laboratory to the bedside and, importantly, bringing problems from the bedside to the laboratory in order to gather additional knowledge and insights that will improve future approaches to clinical care.

A year ago we initiated our first steps in this new direction by announcing the creation of the Stanford Institute for Cancer/Stem Cell Biology and Medicine, the first of the Stanford Institutes of Medicine. Under the direction of Dr. Irving Weissman, Karel and Avice Beekhuis Professor of Cancer Biology, during the past year our Cancer/Stem Cell institute has begun to take shape and, importantly, has provided the organizational vehicle with which we have made substantial progress toward our goal of becoming an NCI-accredited Comprehensive Cancer Center. These efforts, lead by Dr. Karl Blume, Professor of Medicine, Emeritus, were most recently marked by a very successful planning retreat on November 15, 2003, at which over 100 interested faculty discussed the innovations in science at Stanford which will truly distinguish our planned Comprehensive Cancer Center. We currently anticipate submitting our application to the NCI in October 2004. A key part of this effort will be the appointment of the Principal Investigator for the NCI application and a search is currently underway to identify an internationally recognized scientist and leader for this important position. We also look forward to working closely with SHC as it opens its new Ambulatory Cancer Center in

March of 2004 and will soon be announcing the appointment of a new Medical Director for the Clinical Cancer Center.

We have also pursued the planning and organization of additional interdisciplinary efforts under the banner of the Stanford Institutes of Medicine. Three new institutes, the Stanford Neurosciences Institute under the direction of Dr. Bill Mobley, John E. Cahill Family Professor in the School of Medicine, and the Stanford Cardiovascular Medicine Institute, and the Institute for Immunity, Transplantation and Infection have been proposed and approved in 2003 and will be further developed in 2004. Leadership for the Cardiovascular Medicine Institute and the Institute for Immunity, Transplantation and Infection will be named in 2004. Together, these four Institutes will form the pillars on which we will launch a major strategic expansion in translational research and medicine. This effort, which bridges our very significant strengths in basic research and clinical care, is one of the most exciting new developments in the School in recent decades.

As you will recall, the new Department of Bioengineering, jointly governed by the Schools of Engineering and Medicine, was approved by the University Board of Trustees in 2002. In 2003, Dean Jim Plummer from Engineering and I named Drs. Scott Delp, Associate Professor of BioEngineering and of Mechanical Engineering, and Paul Yock, The Martha Meier Weiland Professor in the School of Medicine and Professor of BioEngineering, to be chair and co-chair of this new and exciting department. Under their leadership, the department is now being shaped with faculty recruitments underway. On December 4th, the department obtained approval by the University's Faculty Senate to launch Masters and Doctoral Programs in 2004-2005. Of interest, Bioengineering has also proven to be one of the most popular Scholarly Concentrations among the medical students recently admitted into the New Stanford Curriculum.

In 2003, we also initiated and completed a thorough review of our Center for Biomedical Ethics, leading to a reaffirmation of the Center's critical role in support of our translational mission. With leadership by Dr. David Magnus, Associate Professor of Pediatrics, the Center has been realigned within the school's academic organization in a way that better reflects its interdisciplinary missions.

Discussions this past year between the School of Medicine and the University leadership have also led to the definition of a new research facility, the first Stanford Institutes of Medicine (SIM1). Envisioned as the first of three new facilities supporting our emerging interdisciplinary units, SIM1 will provide the critically needed new research laboratories, core facilities and research animal space needed to support the new Institutes.

While embarking on these exciting new research ventures in 2003, the School of Medicine also maintained its preeminence in sponsored research support among our peer research-intensive schools of medicine. This, of course, is directly related to our outstanding faculty – including those who have recently joined the Stanford community. The development and implementation in 2003 of a School of Medicine core facilities web site and web/email notification system for school seminars, lectures and other research events further enhance communication and opportunities for faculty collaboration across

the School. And, through our new Community Lecture Series, each led by a basic science or clinical Department, we have begun to better engage the residents of our neighboring communities in the great success and future promise of our research activities.

Stanford School of Medicine will always be relatively small among its peer research-intensive institutions. Preserving and enhancing the traditional disciplinary strengths which have served us so well to-date while finding new ways to collaborate and take advantage of the extraordinary strengths of the School, the medical center, the University and the region represent our continuing challenge and unique opportunity. While our new Stanford Institutes of Medicine and SIM1 are significant steps in the right direction, they are only parts of a larger set of strategies involving less formal interactions among faculty, closer coordination between the School's research and clinical activities, and the continuing adaptation of our support systems to better align with these emerging relationships.

CLINICAL CARE

The development in 2003 of the School of Medicine's new Institutes of Medicine has been supported by the concurrent development of corresponding clinical centers of excellence within our two major affiliated hospitals. The development of program and business plans for the new Clinical Cancer Center, to be housed early in 2004 in the SHC Advanced Medicine Center, have led to the (soon to be announced) recruitment of a new clinical director for the Center. Preliminary program and business plans have also developed this year for other SHC and LPCH centers of excellence in transplantation, neurosciences, and cardiovascular medicine.

Recognizing that high-quality, service-excellent and market-competitive clinical programs are essential to the shared success of the school and the hospitals, together we have made significant strides in increasing the alignment and joint planning of our clinical programs and related efforts. We have also recognized the important role that clinician-educators and community based adjunct clinical faculty have in our clinical care and education programs. Moreover, SHC and LPCH have developed and are implementing plans for a geographically distributed clinical delivery system that will permit certain clinical services to be provided within the community, while preserving capacity on campus for specialty and translational services and programs that are best provided in an academic center. Market surveys and discussions with other healthcare systems have been useful in sizing and configuring a community-based ambulatory care facility for SHC. At the same time, LPCH has continued to further develop the extensive clinical network it has put into place during the past several years for both ambulatory and in-patient services.

During 2003, LPCH and School of Medicine faculty developed and implemented the operational elements of the new Pediatric/Obstetrics Faculty Practice Organization, including recruiting and hiring an FPO Executive Director and transferring responsibility and accountability for clinical operations to the new POFPO. This may well serve as a

model for how to optimally integrate hospital and faculty physician clinical programs and services.

PEOPLE

Of course, what makes institutions great – and what distinguishes Stanford – are the people who comprise our faculty, student body and staff. We are privileged to attract among the very best and brightest individuals to our community. In 2003 we again had an outstanding group of medical and graduate students enter our programs. Our resident match was superlative – with nearly all programs attracting their very first choices. We continue to get outstanding fellows into our clinical and research programs.

We have also been successful in both retaining an outstanding faculty and in recruiting a number of wonderful new basic and clinical scientists. In fact, in nearly every situation, we have been successful in acquiring spectacular new talent. We have also attracted new leaders to our new departments of Otolaryngology and Bioengineering and are also in the process of recruiting leaders to important positions within the School (e.g., Orthopedics, Cancer Center Director, etc). That said, one of most important goals is to continue to attract outstanding new young faculty at the Assistant Professor level – and here too, our performance in 2003 has been remarkable and, importantly, the pipeline looks equally promising for 2004.

I am thrilled to welcome each new member of our faculty and am confident that they will continue the tradition of making Stanford special by their contributions to research, education and patient care.

I am also pleased that we have been able to continue our focus on the “Respectful Workplace” and to seek ways of making our environment as sound and supportive as it can be. This is built on recognizing the importance of treating each other respectfully and for having a zero tolerance for misbehavior and harassment. It also means fostering an environment of mentorship, career development and leadership training – all of which have been on the agenda for 2003 and which will surely continue in 2004 and beyond.

ACADEMIC AND ADMINISTRATIVE SUPPORT

The School of Medicine’s success in implementing key initiatives in education, research and clinical care has been made possible by the commitment and hard work of a large number of faculty, students and staff throughout the school, medical center and university. These efforts include the coordinated pursuit of essential strategic plan initiatives in the School’s academic and business support areas.

The structure of the School of Medicine’s professoriate underwent significant planned, and unplanned, changes in 2003. As planned, we implemented the previously approved revised standards for academic appointments, reappointments and promotions within our Medical Center faculty lines, clinician/educator line and adjunct clinical faculty line. These standards more clearly define the academic requirements for the lines and for individual faculty, staff and voluntary faculty within the lines. As a result of these clearer standards, we were also able to adapt to the introduction in 2003 of a “cap” on the size of

the Medical School professoriate. Although representing a significant change in our traditional approach to faculty management, our Academic Affairs organization, the Appointments and Promotions Committee and the chairs of our academic departments have responded with strong institutional support. Through their efforts we have been able to develop and implement revised processes for the review and approval of faculty search requests, and renewed understanding of the value to the institution of each faculty appointment.

The Medical School's Information Resources and Technology (IRT) organization plays a pivotal role in the development of the new tools and systems required to support our increasingly complex models for teaching, research and management. Through selective recruitments and organizational changes IRT has created an organization within the School that has begun providing high quality, enterprise-level IT services. In support of our translational research mission, some of IRT's most notable 2003 accomplishments were the opening of a new secure data center for the School, the deployment of a security firewall for the School's data network, and the design of an integrated Translational Research Data Repository. In direct support of our education and knowledge management missions, IRT also designed and deployed a new Internet-based medical school admissions system (MESA); initiated a Learning Technologies Outreach Program; recruited Debra Ketchell as the new Associate Dean for Knowledge Management and Director of Lane Library; and took initial steps towards a digital library by adding new electronic knowledge resources and lowering barriers to electronic access. And, in support of our IT infrastructure, IRT continued the deployment of a School-wide wireless network in 2003, completed a strategic planning process for a new, School-wide user support model, initiated a new Internet-based teleconferencing service for the School, completed a successful transition to HIPAA compliance and initiated a major redesign of the School's Web site.

The many key strategic initiatives undertaken throughout the School in 2003 have presented some interesting challenges to how we have traditionally viewed our organizations and their management needs. These administrative norms have been further challenged by the continued implementation of new University-based administrative computing systems during 2003. Through an on-going collaboration of Finance and Administration staff, departmental DFA's, and IRT and Planning staff, during 2003 our administrative staff engaged fully in the challenges of managing in this complex and changing academic enterprise. Through these efforts, in 2003 we were able to develop a schema for administrative organizations that, we believe, will allow our administration to flexibly adapt to the needs of our faculty as they increasingly organize in novel and nontraditional units. We will provide more information about these efforts in the months ahead.

During 2003, we introduced a new operating budget allocation formula that promises to recognize and appropriately support the costs of education, research and management within our academic units. We also revised the nearly 30 year-old funds flow formula with the University, bringing the bases for our financial transactions and service agreements in line with our current activities and needs. We also initiated funds flow

analyses with each hospital. And, in 2003, we worked with the hospitals and the University to develop an updated facilities master plan for the Medical Center that will now enable the School and the hospitals to begin planning for our much needed new and replacement facilities.

Early in 2003, we created a new School of Medicine Office of Government Relations and recruited Ryan Adesnik as its director. During this past year we have created a government relations function within the School that works effectively as part of a campus-wide network. Through these efforts we have significantly increased our presence in Washington, DC and Sacramento and have begun to establish an influential voice in the development of national and statewide biomedical and health care policies. In 2003 we played a lead role in forming a national coalition to advocate for increased federal funding to support technologies that will be integral to the SMILE project. In addition, we have worked to support a California bond initiative to establish a new source of funding for stem cell research and research facilities. In 2004 these will be priority initiatives. We have also reinforced our policy perspectives through the initiation of a new health policy speakers' forum. With the recent recruitment of a Paul Costello as our new Director of Communications and Public Affairs, we have the leadership now in place to craft a communications program that fully supports our strategic plans and our roles as active participants in community and public service activities.

In Summary

We have continued to follow the model of simultaneous planning around our multiple missions, recognizing that the solution in one area is often dependent on the resolution of an initiative in a different area. This has proved to be challenging of course and has validated the need for ongoing coordination through our Office of Institutional Planning led by David O'Brien. However, it is clear to me that if we are to achieve our goal of being a role model among research-intensive medical schools, it is imperative that we carefully balance our missions and initiatives in education, research and clinical care. We have, I believe, made progress – and while that is gratifying – there is much more to be done. However, as we get ready to begin the New Year it is appropriate to acknowledge the fact that thanks to the efforts of many of you, we are indeed a “school on the move”. The goal now is to sustain our momentum and to continue the work of making Stanford the best medical school it can be.

What We are Planning for 2004

As we anticipate the New Year, we are well aware of the enormous number of tasks that stand before us. Certainly I recognize that strategic planning and implementation are constant and on-going efforts that will require our commitment, dedication and vigilance. And these efforts will be needed to be sustained year-after-year. That said, it is also important to establish short as well as long-term goals so that we can monitor our progress and adjust our course as necessary. To help guide this, I will outline some of our major initiatives for 2004 in the January 12th issue of the Dean's Newsletter. These will surely be further modified and adjusted during and following our Leadership Retreat that

will take place from January 29-31st. Naturally, I will continue to keep you informed you about the initiatives we plan and the progress we are make in implementing them.

Communication is an important part of our planning process. I have tried hard to keep the lines of communication open – through the regular publication of this Newsletter, direct communications with faculty and students and regular meetings with departments as well as informal gatherings of students and faculty. I recognize that communication is something one can never do enough of – but I also recognize that it is a two-way process. So, I also encourage you to communicate with me about issues or concerns that you have that require our attention or action. Your role in shaping the School is critical and I hope to learn from you the things you think we should be doing that may not be on our agenda – or that you believe will further improve our missions in education, research and patient care.

IRT TECH: Technology Expert Consulting Hours -- Available at Lane Medical Library Starting January 5, 2004

Information Resources and Technology (IRT) is introducing a pilot program for the Stanford University Medical Center community called "TECH" (Technology Expert Consultation Hours). Located at Lane Medical Library, and supported by staff from several IRT divisions, the TECH Desk will provide Medical Center faculty, students and staff with in-person expert advice on a variety of computing, networking, multimedia and instructional technologies. Need help installing and registering your wireless card? Trying to optimize an image with PhotoShop? Interested in setting up a "virtual file cabinet" of PDFs using EndNote? Stop by the TECH Desk!

As of January 5, 2004, visit the TECH Desk webpage at <http://med.stanford.edu/techdesk> for more information on TECH Desk services and hours.

Honors and Awards

- **Dr. Chris Zarins**, Walter Clifford Chidester and Elsa Rooney Chidester Professor of Surgery and Chief of the Division of Vascular Surgery, received the Latvian Republic's "Tris Zvaigznu Ordenis" (Three Star Order). This award was established in 1924 for service to the nation and represents Latvia's highest civilian honor. Dr. Zarins was born in Latvia and during the period of Soviet rule, he helped organize the shipment of medical supplies and equipment to Latvia. Although Dr. Zarins has received numerous accolades and honors during his career – the "Tris Zvaigznu Ordenis" must surely stand as one of his highest and greatest accomplishments.
- **Robin Holbrook** was one of two recipients of the University's Marsh O'Neill Award this year. Robin is the Administrative Services Manager for Genetic Pharmacology in the Baxter Laboratory and in the Department of Microbiology and Immunology. She was singled out for this most prestigious honor because of her long record of extraordinary service within the School and University.

- **Dr. Helen M. Blau**, Donald E. and Delia B. Baxter Professor of Pharmacology, was elected to the Governing Council of the Institute of Medicine of the National Academy of Sciences through 2006.

Congratulations to all!

Appointments and Promotions

- **Bingwei Lu** was appointed to Assistant Professor of Pathology, effective 1/1/2004 to 12/31/2006.
- **Gavin Sherlock** was appointed to Assistant Professor (Research) of Genetics, effective 1/1/2004 to 12/31/2006.
- **Corinna Darian-Smith** was reappointed to Assistant Professor of Comparative Medicine, effective 12/1/2003 to 11/30/2007.

Dean's Newsletter January 12, 2004

What We are Planning for 2004

In the January 5th issue of the Dean's Newsletter (<http://deansnewsletter.stanford.edu/>) I highlighted some of the accomplishments we achieved in 2003 in bringing our Strategic Plan "Translating Discoveries" to fruition. Although we have made considerable progress, we still have a very long way to go before we have fully achieved our numerous initiatives and goals. Because it is important that we continue to forecast the areas we will focus on and then strive to measure our progress, I felt it important to lay out our plans for 2004. I fully recognize that this is a high-level review and that it will almost certainly be subject to modification as we proceed through the year. However, I also believe that it is very important to continue to develop and refine our roadmap so that we can optimize our institutional success. I also want to underscore again that this review addresses only school-wide initiatives and neglects the equally or more important initiatives of our faculty, students and staff in education, research and patient care. I further recognize that these plans will be likely modified as a result of our upcoming Leadership Retreat that will occur from Jan 29-31st.

As has been the case over the past couple of years, the School of Medicine's plans for 2004 will focus on continued and enhanced efforts to create opportunities for collaboration across our traditional disciplinary boundaries. These efforts will be undertaken in all areas of our strategic plan, including both medical and biosciences graduate education, research and clinical care, the professoriate, and our critical enabling areas of information resources and technology and finance and administration.

EDUCATION

The design of the New Stanford Curriculum for medical education, and its initiation in the Fall of 2003, represents an important cornerstone in the success of our strategic plans.

The new curriculum provides a framework for new interdisciplinary interactions, the benefits of which will be translated throughout our institution.

The first phase of the New Stanford Curriculum focused on the first two years and refinements will continue to be made. In 2004 the design and content development of the new curriculum will be extended into years 3, 4 and beyond, with a particular focus on the integration of basic science with clinical medicine along with the development and integration of innovative new teaching modalities to support individualized learning. In addition to the formal initiation of the new scholarly concentrations we will also introduce the new portfolio system for documenting and presenting students' scholarly contributions. In 2004 we will also introduce a new curriculum evaluation program that will be employed to refine the design, content and delivery of the years 1 and 2 curricula and to evaluate our admissions criteria. New tools will also be developed and implemented to improve and standardize the evaluation of students in clinical clerkships and to improve our student advising and mentorship systems. Commensurate with its transformational role in medical education, in 2004 we will also undertake to develop an appropriate communications plan for the public dissemination of information about the New Stanford Curriculum.

We are also committed to extending the New Stanford Curriculum's fundamental principles of scholarship and life-long learning into the related graduate, postgraduate and continuing medical education programs throughout Stanford Medical Center. In 2004, in partnership with the hospitals and departmental program directors, we plan to undertake programmatic and organizational changes that will ensure the highest-quality training experience, including appropriate opportunities for continued scholarship and exposure to emerging scientific discoveries and innovations, for residents and fellows. These initiatives will include the development and introduction of new scholarly programs for residents, the documentation and evaluation of current scholarship and research programs for clinical fellows, the recruitment of a new director of Continuing Medical Education, and the development of new CME training goals and program modalities.

This year will also see a number of new initiatives in our programs for biosciences graduate education and postdoctoral research training. Here we will also be focusing on program innovations that will reinforce our core strengths in basic research while creating opportunities for an enhanced understanding of the challenges and needs of the biomedical sciences. Most notably among our 2004 plans are a commitment to develop a new program to expose biosciences graduate students to studies of human health and disease. We hope to have this program ready for the 2004/2005 academic year. In 2004 we will also be working to evaluate and recommend new opportunities for joint MD/PhD and MD/MSc degree programs associated with the original research elements of the medical education scholarly concentrations.

Through the recruitment in 2004 of a director for our new biosciences career center, we will begin to develop new programs to introduce biosciences graduate students and postdoctoral scholars to career opportunities in biomedicine and biotechnology. The very successful PhD alumni symposium held in 2003 on stem cells will be replicated in 2004

with gatherings on other topics of strong current interest in biosciences research. And, finally, our efforts to increase the diversity among the ranks of all our trainees will continue with launching of new programs for achieving this goal in our community of PhD students.

In conjunction with the School of Engineering, we anticipate admitting the first group of graduate students to our new Joint Department of Bioengineering. This is an enormously exciting area and important initiatives are underway to develop a world-class curriculum and, in 2004, to also carry out some key new faculty recruitments to help further develop and support the program.

By the end of 2004, as a result of these and other new initiatives, we expect to have in place at the School of Medicine the key elements of a comprehensive and integrated set of educational and training programs that will provide a truly unique opportunity for our students and trainees to bring science and medicine together to enhance discovery and improve human health.

RESEARCH

With the nascent establishment of our four new School of Medicine institutes in 2003, we are entering 2004 uniquely positioned to pursue a number of truly innovative and important new research initiatives that will further our core mission of translational research and medicine by building on our tremendous record of accomplishment in basic research, an area that will always be the foundation for nearly everything we do.

In 2004 we will identify faculty leaders for the new Stanford Cardiovascular Institute and the Stanford Institute for Immunity, Transplantation and Infection. These leaders will join Dr. Irv Weissman, Karel and Avice Beekhuis Professor of Cancer Biology and Director of the Stanford Institute for Cancer/Stem Cell Biology and Medicine and Dr. Bill Mobley, John E. Cahill Family Professor and Director of the Stanford Neurosciences Institute, in the further development of the programmatic, organizational, resource and implementation plans for the institutes at the School of Medicine. As a result of these efforts, in 2004 we will develop a detailed program for the School of Medicine's next new science building, the Stanford Institutes of Medicine 1 (SIM1), which will provide the essential research space needed to support the initiation of these institutes and their associated departmentally-based collaborators. In tandem with this we are looking toward leasing additional research space off-campus to provide interim support until SIM1 is complete. Moreover, we will reintroduce the topic we discussed last year about developing a second campus for additional deliberation and discussion.

While interdisciplinary research and translational medicine are fundamental activities of all four institutes, they also exist in many other forms throughout the School of Medicine. A number of significant research initiatives planned for 2004 recognize the strengths of these existing scientific relationships and the opportunities arising from them. In the coming year we will be preparing and submitting specific proposals in response to the recently announced NIH Roadmap for Medical Research. These proposals, in a variety of areas including bioinformatics, and training of clinical investigators, will bring together

our unique interdisciplinary strengths, drawing on faculty expertise across the school, in a focused response to selected NIH priorities.

In a related, parallel effort already underway, we are committed to submitting in 2004 our formal application for consideration as an NCI-designated Comprehensive Cancer Center. This application, resulting from many months of effort by faculty throughout the school, will represent a significant achievement for Stanford's cancer-related programs, linking the Institute for Cancer/Stem Cell Biology and Medicine to the SHC Advanced Medicine Center and unifying under a common program diverse set of faculty research interests.

A third important translational research initiative planned for 2004 will seek to strengthen our scientific relationships with the local biotechnology industry. Initiated in 2003 in collaboration with SRI, UCSD and UCSF, the PharmaSTART program will seek and fund a second round of translational drug development applications in 2004. Our continued commitment to this unique program will serve to catalyze inter-institutional collaboration in the areas of drug development and clinical testing

In 2004 we will also pursue the development and implementation of a number of key enabling initiatives that will be critical to the success of our translational objectives. We will move forward this year in the implementation of the clinical trials budgeting recommendations of the joint School-Hospitals-University Translational Research Task Force. The full implementation of these pricing and budgeting procedures is essential to the continued growth of our clinical research programs and is needed in order to comply with a variety of governmental regulations involved in appropriate allocation of clinical research costs. We will undertake the development of a biostatistics and data management plans in 2004 that will ensure the availability of these key resources for our NCI Cancer Center, our Stanford Institutes of Medicine, and all of our clinical research initiatives.

To support our entire research agenda, we will conduct a comprehensive review of our current core facilities and needs and recommend priorities for development with SIM1 and beyond. We will also be developing several new web-based tools to support discussions among the faculty around interdisciplinary research opportunities and to improve public and University knowledge concerning ongoing clinical research activities at the SOM. And, in 2004, we will explore additional mechanisms to foster communication between basic scientists and clinical researchers.

CLINICAL CARE

In 2004 we will continue to work with Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) to refine and implement those key linkages between our strategic plans that most critical to our mutual success.

The most immediate of these conjoint initiatives will be the activation of the SHC Advanced Medicine Center, the recruitment of a Clinical Cancer Center director and the development of joint program and operating plans between the Cancer Center and the

Institute for Cancer/Stem Cell Biology and Medicine. With the concurrent development of our NCI Cancer Center plans, these coordinated initiatives in 2004 will affirm and enhance Stanford Medical Center's position among the nation's premier cancer care providers. Similar efforts will also be initiated in 2004 to formalize the relationships between our Neurosciences, Cardiovascular and Immunity, Transplantation and Infection Institutes with their clinical counterparts in SHC and LPCH.

In 2004 we will also work with the hospitals to implement new business and professional plans to ensure the on-going availability of Stanford-affiliated physicians. The implementation of recommendations from the current School – SCH – LPCH Clinician Educator Task Force, will be important to our success. At the same time, we will continue to work with LPCH to operationalize and refine the new Pediatrics/Obstetrics Faculty Practice Organization and explore with SHC options for similar practice structures for our adult services. In particular, we are eager to explore more of a “group practice” model.

Developing plans to ensure the necessary amounts and types of appropriate located clinical facilities will be a high priority in 2004. While provider consolidation within the local market will continue to present significant challenges to our necessary patient base, our new, more flexible, faculty and physician staffing models will provide us with new opportunities to respond and create a truly community-based Stanford presence that has here-to-fore been infeasible. In 2004 we will take these new opportunities and translate them into clinical care plans that effectively integrate the needs of both our community service and translational medicine missions.

ACADEMIC AND ADMINISTRATIVE SUPPORT

We will continue to guide the restructuring of our professoriate in 2004 through key initiatives in the areas of improvements in the faculty appointments and promotions process and faculty development programs. To ensure that our decisions to hire new faculty bring as much academic value to the institution as possible within the University's limitations on faculty size, the revised process for faculty search authorizations developed last year will be continued this year, along with its associated billet tracking data systems. We will also evaluate our traditional models for faculty appointments in order to provide more opportunities for joint appointments and other appointments involving geographic or organizational splits.

To ensure that the faculty we have are afforded every opportunity for their academic success, in the coming year we will also introduce a new curriculum for faculty development opportunities targeted to the needs of all faculty at various stages of their careers. In conjunction with on-going improvements to existing faculty mentoring and advising programs, we will ensure that all of our faculty have access to the necessary information and tools to succeed at Stanford. In 2004 we will also introduce new programs and policies designed to address the specific unique needs of women in medicine and science and minority faculty.

Secure and reliable information access and exchange remains an essential element of translational research and medicine and, as such, a high priority of our strategic plan. In 2004, initiatives are planned for our Information Resources and Technology group that will continue to develop a very solid IT infrastructure. To ensure a free flow of information and data between the School and the hospitals and University, IRT will work with SHC and LPCH to implement a shared IT data model, develop a joint SoM/SHC/LPCH IT advisory and communications committee, work with the hospitals and the University to develop shared approaches to IT security threats, and begin implementation of an IT model to support the clinical cancer center. To support the information and data needs of individual and interdisciplinary researchers and clinicians, in 2004 IRT will deploy the School's secure data center service, develop a standards-based translational research data repository, develop a model for an IT core facility, implement a new web-based faculty research database, implement a clinical trials application, pilot a knowledge base at the point of care for clinicians, develop the concept of the clinical informationist, and develop a plan for patient health information. To ensure secure access to data and IT resources, IRT will deploy a network firewall and intrusion detection system, continue deployment of a secure, wireless network, and work toward required April 2005 compliance with the HIPPA security rule.

In 2004, IRT Knowledge Center and Learning Technologies staff will conduct focused strategic plans to further define the nature of these functions within educational and translational missions of the School and will continue to provide program and design input as members of the SMILE project team. And, to better support all users of School information, in 2004 IRT will implement the recommendations of the School's Web Design Task Force to deploy a new web site for the School (which is, in fact occurring today January 12th!), design and implement a School-wide desktop support model, and conduct, in partnership with Finance and Administration, an administrative systems strategic plan.

As our faculty's educational, scientific and clinical interrelationships continue to become more varied and more dynamic, our Finance and Administration staff are committed to developing newer and better ways to deliver the administrative support necessary for the faculty's success. In 2004, Finance and Administration will pilot key elements of a more faculty-focused administrative model that supports the needs of our traditional departmentally based academic units as well as a wide variety of existing and emerging non-traditional units, while more clearly delineating the administrative responsibilities of the units. In conjunction with this effort, we will be introducing a review and approval model for emerging administrative units that will support our need to readily respond to new, and often transient, opportunities while ensuring an on-going alignment of these units with the overall goals of our departments and the School.

In the coming year, F&A will also undertake a thorough review of existing operating, consolidated, and capital budgeting processes with a goal of identifying specific process improvements to streamline, simplify and better align these processes with our organizations and financial management goals. We will also continue our efforts to increase administrative excellence across the institution through the implementation of

new training programs for managers and staff, the establishment of standards of service tied to our mission and the articulation of our core administrative values. The School's staff will continue to review and refine the funds flow models between the School and the Provost's Office and between the School and the hospitals. In addition, our staff will continued to implement the new financial and computing systems developed by the University and to manage and respond to the challenges posed by these changes.

In 2004, to ensure that we are able to attract and retain the high quality staff needed to support the School's objectives, we will also redouble our efforts to create and promote programs contributing to an appropriate work-life balance.

Our strategic efforts in this coming year will also include important continuing and new initiatives in public policy and advocacy, communications and development. Our government-relations office was newly formed in 2003. This year we will build on the newly established contacts and relationships that have been developed to increase our voice as a public policy advocate at the local, state and national levels. This will include an expansion of the health policy speakers' forum that was successfully inaugurated last year and the continued development of a roster of faculty "experts" available to advise on health and research policy issues. In 2004 we will need to keep a close eye on the agenda of the United States Congress, as they intend to consider reauthorization legislation that will closely look at all aspects of the NIH. A similar effort has not taken place for ten years.

With the arrival of Paul Costello on January 6th as our new Executive Director of Communications and Public Relations, in 2004 we will be able to bring a new comprehensive high quality institutional communications plan to bear on our advocacy and development needs. This will be particularly critical to fundraising, as we expect to initiate full-scale fundraising efforts in 2004 for our SMILE and SIM1 projects as well as a broad and ambitious collection of strategic educational and research initiatives.

In summary

It is hopefully clear that a lot has happened during the past couple of years and, even more importantly, that we have lots planned for 2004 and beyond. Without question, our agenda for 2004 is very ambitious. But we have come a long way in just two years and our continued focus on the important work before us, and perseverance toward our goals, will surely bring these plans to fruition. Working together we will all contribute to the successful transformation of medical education at Stanford and the reaffirmation of Stanford Medical School as the premier research-intensive medical school.

New School of Medicine Web Site is Launched

Today, the Office of Information Resources and Technology (IRT) at the School of Medicine launched the first phase of our new Web Site. This new site contains over 3000 redesigned Web pages. The new Web site can be accessed at:

<http://med.stanford.edu/>.

With the leadership of Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, we now have an outstanding beginning of what will surely be a wonderful Web Site for the School of Medicine. Many individuals have worked diligently to bring this first phase to fruition. In addition to Dr. Lowe, I would like to thank in particular the IRT web development staff and especially Michael Halaas (IRT Associate Director for Web Development, in the Division of Systems Development), Kevin Boyd, Richard Renn, Aleya Chakravarti, and Praveen Morusupalli.

The new Web site is a great new beginning and we can look forward to many continued improvements and changes during the next eighteen months. We are off to a great start – and it is a wonderful way to begin 2004!

Stanford's Department of International Medical Services is Re-ignited

I am pleased to relay this important announcement prepared by Dr. Alan Yeung, Associate Professor of Medicine and Co-Director of the Stanford Hospital Heart Center. Per Dr. Yeung, Stanford's Department of International Medical Services (IMS) has re-ignited a successful international outreach program directed at the Asia Pacific Region. The backbone of this program is clinical education programming led by Stanford faculty based on monthly teleconference sessions transmitted live from Stanford to Asian affiliates.

Recent advances and improved telecommunication networks have made the teleconference-based programming a very time and cost effective means for providing educational programming. The current system will support simultaneous participation by up to four foreign sites. For the past three years, IMS has hosted a monthly transmission to Singapore General Hospital, Chinese University (Hong Kong) and Makati Medical Center (Philippines). In January 2004 a second monthly program series will begin with transmissions to three institutions in India.

These sessions begin with a Stanford-led lecture and conclude with a Q&A period. The audiences are made up of clinical specialists in the given field, with an average total attendance (all three sites) of 50 - 100.

The content of the programs is selected by our foreign affiliates. At the beginning of each year, the overseas centers provide IMS Director, Jennifer Sims, with a list of specific topics in which they have an interest. Jennifer cross-references the topic lists from the multiple sites to find common interests and then identifies Stanford faculty with appropriate sub-specialty expertise. I would encourage your participation. Indeed, Drs. Yeung and the IMS Director, Ms. Jennifer Sims, are seeking faculty to participate in these education sessions. If you are interested please contact Dr Yeung (Alan_Yeung@CVMed.stanford.edu) or Ms. Sims (LAMPMAN_J@HOSP.STANFORD.EDU).

Events

- ***First Edward Rubenstein Lecture.*** Thanks to a wonderful contribution from Martha Lee and Tom Parker, a new lecture series honoring Stanford Professor of Medicine Edward Rubenstein was established. On Tuesday evening, January 6th, the inaugural Edward Rubenstein Lecture was given by J. Michael Bishop, Chancellor of the University of California, San Francisco on “Cancer and Double Helix”. It was a spectacular event and I want to thank the Parker family for making this possible and congratulate Dr. Rubenstein for having a important new lecture series named in his honor.
- ***CCIS Kroc Lecture.*** Thanks to Dr. C. Gary Fathman, Professor of Medicine and his colleagues, CCIS and the Kroc Foundation sponsored the lecture on Tuesday June 6th that was given by Dr. Marc Feldmann, co-winner of the 2003 Lasker Award and Head of the Kennedy Institute of Rheumatology at the Imperial College, London. Dr. Feldman gave a wonderful presentation on “Anti-TNF Therapy in Rheumatoid Arthritis: Past, Present and Future”
- ***Community Lecture Series.*** As part of our continuing monthly series of presentations to the community about work being conducted in various departments in the School of Medicine, Drs Mark Hlatky, Professor of Health Research and Policy and of Medicine and Dr. Laurence Baker, Associate Professor of Health Research and Policy, gave a terrific presentation on “Medical Innovation, Rising Costs, and the Health of the Public”. As you might imagine, the presentation engaged the audience in lots of questions and commentaries.

Honors and Awards

- ***Dr. Daria Mochly-Rosen*** was honored on Thursday night, January 7th, at a dinner recognizing her being named as the George D. Smith Professorship in Translational Medicine. It was a lovely event.
- ***Dr. Richard Bland***, Professor of Pediatrics, will receive an honorary Doctorate of Medicine from the University of Uppsala, in Sweden this month. Congratulations to Dr. Bland.

Appointments and Promotions

- **Julie Baker** has been reappointed to Assistant Professor of Genetics, effective 2/1/2004 to 1/31/2007.
- **Mark Genovese** has been promoted to Associate Professor of Medicine at the Stanford University Medical Center, effective 1/1/2004.
- **Deirdre Lyell** has been appointed to Assistant Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 1/1/2004 to 12/31/2006.
- **Sandy Napel** has been promoted to Professor of Radiology and, by courtesy, of Medicine, effective 12/1/2003.
- **Jonathan Pollack** has been reappointed to Assistant Professor of Pathology, effective 1/1/2004 to 12/31/2007.

Dean's Newsletter

January 26, 2004

My View on the Importance of the School of Medicine and Medical Center to Stanford University

There is little question that these are challenging times for academic medical centers. But they are also exciting ones, coupling opportunity with risk. There is also little question that the relationship between academic medical centers and their parent university is also dynamic and, depending on the particular circumstances, is lauded or questioned. Much of this has to do with concerns about the relative size of the medical school or concerns the financial well being of an academic medical center and particularly its hospital affiliates (especially if owned by the university) might represent a perceived threat to the university's financial well being, including its important credit rating. Add to this the fundamental differences in the missions of an academic medical center and the multifaceted roles that faculty must play.

Certainly there were reasons for concern at Stanford in recent years. Following the merger and then de-merger of Stanford with UCSF a number of distractions and consequences impacted the medical center and created anxiety both within it as well as within the University leadership. But a lot has changed during the past 2-3 years. For example, in FY01, the year of the unwinding of the merger, both Stanford Hospital & Clinics (SHC) and Lucile Packard Children's Hospital (LPCH) projected significant financial losses, creating considerable concerns about their overall viability. But by FY02 the financial picture for both hospitals had shown evidence of considerable recovery and in FY03 they each demonstrated positive margins, a pattern that continues in the current FY04 fiscal year. While these earnings will be needed to reinvest in equipment and important capital and programmatic needs, they give evidence of considerable financial strength in a still very difficult marketplace. Moreover, both hospitals are filled and each are carrying out state-of-the-art care, including making important new discoveries that bring knowledge from the bench to the bedside, which we refer to as *Translating Discoveries*, the overarching strategic theme for the School of Medicine (<http://medstrategicplan.stanford.edu/>).

There is no doubt that the improved financial performance of SHC and LPCH reflect the careful management by the Hospital CEOs and the leadership teams they have assembled. Perhaps even more important is the increased clinical volume at both hospitals that reflects the work of our Stanford clinical faculty. This dedicated cadre of clinicians and clinician-scholars/investigators has significantly increased their productivity – and workloads – seeing more and more patients in both the outpatient and inpatient settings. Moreover, the work of our faculty now comprise the vast majority of overall clinical activity at both hospitals – nearly 100% at LPCH and about 85% at SHC.

In addition, the past 2-3 years have witnessed a number of important clinical recruitments across the School but perhaps most significantly in surgical departments. Indeed, compared to just a couple of years ago, surgical activity and volumes have increased considerably, reflecting new surgical programs. Importantly, each of our clinical programs also opens new portals to our community – locally, regionally and internationally – and provides an additional face to Stanford University.

Of note, at the same time that this increased patient-care activity has occurred, our clinical faculty have also increased the number of NIH grants coming to clinical departments and have been highly productive in both research and education. We owe them thanks and appreciation for their committed and dedicated efforts and contributions.

Further, the School of Medicine as a whole has increased its amount of NIH grant support during the past several years, also reflecting the remarkable contributions of our stellar basic science faculty and constituting the largest area of research growth within the University. This research productivity – especially its very high quality – reflects on both the School of Medicine and the University.

While various members of the community perceived or were suspicious that the School of Medicine was a financial drain on the University, the facts speak otherwise. As a “formula school”, the School of Medicine is on its “own financial bottom”. Equally importantly, during the past year the School redid its decades old formula with the University using a cost-allocation methodology that assures that the School pays for all the costs it incurs by being part of Stanford University. Moreover, the School contributes money to the University through interest income accruing to the “Expendable Funds Pool (aka EFP)”.

Despite this high level of clinical and research productivity of our faculty and the now clearly very improved financial performance of our hospitals, it is surprising that there is still, in some quarters, a range of negative views about the Medical School and Medical Center within our University community. Certainly I understand that perceptions and concerns change slowly, especially given the somewhat tumultuous past decade. Recognizing that concerns and fears do exist, I have made one of my major goals to more closely align the School of Medicine with the University. While there is much to be done, I feel that we have made progress in this arena. Moreover, it is exquisitely clear to me how very important the School of Medicine and Medical Center are to Stanford University in a number of ways.

That we continue to attract outstanding medical and graduate students as well as residents and fellows helps improve the intellectual lifeblood of the School and University. It is also notable that a significant proportion of undergraduates come to Stanford with an interest in medicine – and the fact that there is an outstanding medical school as part of the university must contribute to the decision of many to attend Stanford. Our New Stanford Curriculum is also setting a new standard for medical education, and our programs in the Biosciences are among the best in the nation – adding to the University’s

outstanding graduate programs – as well as to the University’s ranking as a research-intensive university.

Our new Stanford Institutes of Medicine also serve a unique role in aligning the basic and clinical science faculty within the School of Medicine around important themes: Cancer/Stem Cell Biology, Neurosciences, Cardiovascular Medicine, and Immunity/Transplantation/Infection. Importantly, each of the Stanford Institutes of Medicine also seeks to engage faculty and students from throughout the University who are interested in these important and challenging areas in science and medicine. Equally importantly, the Stanford Institutes of Medicine are designed to enhance and foster translational research and to thus make even more relevant to our communities the dividends of biomedical research.

The new joint department of Bioengineering between the School of Medicine and Engineering also reflects the important relationships between the two schools and is already showing evidence of significant impact by the quality of the faculty recruitments and first applicants to the graduate studies program.

One of the most important initiatives of the University during the past several years has been the faculty-driven initiative referred to as BioX. The relationships between the physical, engineering, computer science, and biomedical sciences serve as the underpinning of this important University-wide initiative. But what will make this unique and of palpable importance to our community is the potential of translating these discoveries into new insights as well as new strategies to better diagnose, treat or prevent human disease.

Similarly, the evolving additional University-wide initiatives in energy and the environment as well as the role of Stanford in the global community also derive benefit from the School of Medicine. For example, there is no question that environmental issues and concerns are of major importance to life on our planet. It is also true that virtually all human disease is the consequence of one’s genetic composition (either simple Mendelian or complex genetic interactions) with the physical or biological environment. Thus an interdisciplinary effort on the environment derives important benefits from a focus on human health and disease. Similarly, there is no doubt that global health is one of the most important issues facing our world-wide community, especially as the traditional geographic boundaries no longer separate disease demography or distribution. Here too, the work of Stanford faculty on a wide-range of diseases as well as the extant and evolving collaborations that exist throughout the world contribute to the University’s goals.

These interactions between our Schools of Medicine, Engineering, Humanities & Sciences, Law, Education, Earth Sciences and Business offer extraordinary opportunities to improve the world. These interactions are fostered by bringing together a diverse and outstanding faculty and students who collaborate, interact and as a consequence, move the agenda to new and exciting areas. I am convinced that the School of Medicine plays a critical role in this process and thus brings distinction to the University. There is a not-so-

funny joke (at least to me) that asks why among the leaders of major universities only the president of Princeton is smiling? And, the answer of course is that Princeton doesn't have a medical school! There is no question that Princeton is an outstanding university but, at least in my opinion, during the new era of biology and interdisciplinary science, only those universities with a medical school will be able to take full-advantage of the exciting discoveries that are and will take place – and make them relevant to human disease and well being.

Similarly there is no question that Stanford is a great University. But, in my opinion, a significant part of its excellence now – and especially in the future – will be the consequence of having a wonderful medical school and medical center. This is something to celebrate.

And, of course, Stanford also has great basketball teams!

Comparing Notes: A Visit to Penn

On January 20-23, I visited the University of Pennsylvania School of Medicine and Medical Center, accompanied by Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs and Professor of Medicine and Mike Hindery, Senior Associate Dean for Finance and Administration. We visited with the leadership of the School and Penn Health System to better understand the relationships and interactions that now exist in the faculty clinical programs and interactions with the hospital and larger health system. Of course Penn, like Stanford, has gone through some challenging times in recent years. Also, like Stanford, they are emerging with a more successful enterprise and in nearly all areas appear to be doing quite well. Of note, the relationship of Penn Medicine to the University seems stronger now – although it was certainly tenuous just a couple of years ago, when the financial status of the health system was so precarious. If you are interested in the events that unfolded at Penn (and that shook the academic medical world) they are well described in a new book by Dr. John Kastor entitled “***Governance of Teaching Hospitals. Turmoil at Penn and Hopkins***” published by The Johns Hopkins University Press in 2004.

Because we have been contemplating changes in the physician practice model at Stanford, we were interested in learning more about what was happening at Penn, where changes were guided by organizational alignment, strong practice plan business management, shared resources and strategies, accountability for performance in each practice based on credible data generated by the practice plan, uniform audit and compliance standards, and the application of market strategy principles to assure the right mix of primary and specialist physicians and the appropriate incentive-based compensation models for physicians. If you are interested, these are reviewed in a recent article by David Longnecker et al entitled “*Future directions for Academic Practice Plans: Thoughts on Organization and Management from Johns Hopkins University and the University of Pennsylvania*” *Academic Medicine* 2003; 78: 1130-1143.

During the next several months we will be reviewing the optimal practice models and will report back on our progress. It should be noted that a Pediatrics and Obstetrics Faculty Practice Organization is being established jointly between the hospital and school and can serve as a model for future clinical practice activities in the medical center.

Upcoming Strategic Planning Leadership Retreat

From Thursday, January 29 – Saturday, January 31st, we will be holding our Third Annual School of Medicine Strategic Planning Leadership Retreat on Translating Discoveries. Our first Retreat was held in February 2002 and has helped to set the stage for many of the mission-based changes that we have been making across the School of Medicine. As with the prior two Retreats, we will bring together a diverse group of approximately 75 leaders to address where we are now – and where we are going – to make Stanford fulfill its mission *‘to be a premier research-intensive medical school that improves health through leadership and collaborative discoveries and innovation in patient care, education and research’*.

As with the two past events, the attendees will represent a wide number of constituencies: The School’s Executive Committee and Department Chairs, Senior Deans, Institute Directors, Hospital CEOs, as well as University leaders including the Provost, Vice President for Development, University Trustees and Hospital Directors and, of course, representatives from our medical and graduate student classes as well as residents and fellows. The goal of course will be to present updates (which I will cover in future Newsletters) as well as to generate critique and new ideas that will help to further improve our plans and goals for the School of Medicine.

The overall agenda for the Retreat “Translating Discoveries” will include:

Thursday afternoon, January 29th

- Medical Education: Toward a Medical University
- Biosciences Education and Training
 - Flexible Strength in Graduate Education
 - Achieving Excellence in Postdoctoral Training
- Opportunities for Change in Graduate and Postgraduate Medical Education
- The Academic Workforce:
 - Academic Affairs: Our Changing Professoriate
 - Clinician Educators: Important Workforce for the Success of Stanford’s Clinical Program
- Finance and Administration: NOT Lost in Translation
- A Special Evening Presentation on the Future of Academic Medicine will be delivered by Dr. Jordan Cohen, President of the Association of American Medical Colleges

Friday, January 30th

- Transforming the IT Environment

- 2004 Collision Course: Defending Science from Politics
 - Clinical Program Strategic Planning
 - Stanford Hospital & Clinics and the Adult Clinical Faculty
 - Lucile Packard Children's Hospital and the Obstetric and Pediatric Faculty.
 - Enabling Translation (A Panel Discussion)
 - Cancer/Stem Cell Institute
 - Toward a NCI Comprehensive Cancer Center
 - Neuroscience Institute
 - Cardiovascular Institute
 - Immunity, Transplantation, Infection Institute
 - Biodesign Program
 - Translating Our Vision and Goals into Reality
 - When the Rubber Meets the Road – Opportunities and Challenges for 2004 (There will be 7 groups each addressing two major questions. The questions will include a number of issues, including the following)
1. Extending Our Programs:
How can we enable and foster more effective interaction between basic and clinical scientists in order to enhance translational research? How can we promote “economies of scope” within traditional departmental organizations and between faculty with defined roles (e.g. Investigators, Clinician-Scholars/Investigators, Clinician Educators)?
 2. Extending Our Campus:
How can we use off-campus space as a transitional resource to SIM1 (≈2009-2010)? How can we use off-campus space as a transitional resource to SIM2 and to SIM3? Should we develop off-campus space as a permanent resource? Can/should our research, clinical and management needs be co-located off-campus? How can we extend our “campus” into local biotechnology industries?
 3. Extending Our Faculty and Roles:
How can we incorporate residents and postdoctoral scholars (PhD and MD) into our scholarly concentrations? How can we change our culture to more effectively incorporate the clinician educators into the medical school's mission? How can we create more “turnover” billets and more interdisciplinary replacement faculty? How can we reduce/eliminate division/department/school limitations on faculty programmatic objectives?
 4. Extending Our Patient Care Mission:
How can SHC preserve an increased focus on specialty care and still survive in the local healthcare market? How can we better integrate our clinical programs at SHC and LPCH into a local/regional healthcare network? How can we rationally differentiate our clinical programs and locations of service? How can we significantly increase our presence as a Pacific Rim healthcare provider?
 5. Extending Our Infrastructure:

How can we ensure the delivery of high-quality, responsive and economical management services to faculty in multiple programs and multiple locations that are both departmentally and non-departmentally based? What is needed to develop state-of-the-art infrastructure and platforms to facilitate clinical and translation research? What is needed to ensure our support for basic science research? What is needed to support our missions in education? How can we provide better incentives to generate new funds?

6. Translating our Vision and Goals into Reality: The Importance of Philanthropic Support:

How can we best communicate our vision to our traditional and new donor populations? How can we engage new donor populations in support our plans? How can we create a mutually beneficial “campaign” supporting the needs of the School and both hospitals? How can we best distinguish our plans and needs from those of our peer institutions in the minds of prospective donors? How can we ensure the broadest possible utility from philanthropic support?

Saturday January 31st

Presentation and Discussion of Breakout Sessions: Further Crafting Our Agenda
Additional Reactions, Recommendations and Suggestions

As you can see, we have a very ambitious agenda for the Retreat. I will certainly be presenting updates in subsequent Dean’s Newsletters but would also welcome reactions or suggestions even prior to the Retreat if you would like to share them. Naturally it would be great if we could bring everyone to the Retreat but that is not practical. But I still hope you can and will feel part of this planning process – and share your thoughts with us.

Leadership Changes in the Office of Medical Development

In early January Ms. Jackie Brown, Director of the Office of Medical Development, announced her decision to step down and pursue new directions. Ms. Brown has been a part Stanford for more than a decade and a half and has made major contributions to the School, Medical Center and University. Widely admired by her staff and the School, Ms. Brown helped lead the School through a period of exceptional philanthropic support. She has been an absolutely committed and dedicated professional and always put the School and Medical Center as her highest priorities. I very much enjoyed the opportunity to work with her and want to thank her tremendously for all that she did for Stanford –she will be missed.

In the interim, Ms. Kathleen Gilchrest and Ms. Patricia McLeod will share the responsibilities of co-Directors while we begin the search process for an Executive Director of the Office of Medical Development. Obviously this is a most important position for the School and Medical Center, especially as we get ready to move forward with the next phase of plans for a Capital Campaign.

Graduate Education: Improving Diversity

At its January 16th meeting, the Executive Committee heard a report from Dr. John Boothroyd, Senior Associate Dean for Research, Graduate Education, and Postdoctoral Affairs, and his colleagues Drs. Karla Kirkegaard, Ellen Porzig, and Ms. Kimberly Griffin about the Biosciences Graduate Programs. Currently there are twelve graduate programs in this group: Biochemistry, Biological Sciences, Biophysics, Cancer Biology, Developmental Biology, Genetics, Immunology, Microbiology and Immunology, Molecular and Cellular Physiology, Neurosciences, and Structural Biology. There is a single admissions process, and applicants specify their three top program choices.

The report noted that each student in the Biosciences Graduate Programs is fully funded. A major advantage of our admissions process is its highly personalized nature. Candidates who are invited to campus interview with five or six faculty members, and it is made clear to them that each student is truly valued. Last year, the Biosciences Graduate Programs had 1097 applicants, of whom 213 were admitted. Of those, 100 students matriculated in September 2003.

Dr. Kirkegaard, Co-chair of CGAP (Committee on Graduate Admissions and Policy), reviewed the topics currently under consideration by CGAP this year. These include:

- Ways to remove barriers to interdisciplinary graduate education
- The articulation and enforcement of shared values for graduate education
- The recruitment of the most qualified applicant pool for each program
- Recruitment and retention of under-represented minorities
- Creative interaction with the Scholarly Tracks in the new medical curriculum

Dr. Kirkegaard explained that one of the primary goals of CGAP is to foster both the diversity of the biosciences programs and some degree of coherence across them. The group is interested in getting the graduates students exposed to as many of the laboratories as possible, as well as to clinical programs.

Dr. Ellen Porzig, Associate Dean for Graduate Education, presented the results of a recent survey on graduate education. This survey assessed the overall satisfaction of our graduate students with such aspects of their experience as the quality of their graduate courses, their research experience, access to selecting a dissertation lab in any home program, mentoring, and whether they investigated or pursued rotation with faculty in clinical departments. While the analysis is still in process, the results so far indicate that our students have a high degree of satisfaction with their graduate education. It is anticipated that a written summary of the survey results will be available by July 2004.

Ms. Kimberly Griffin, Director of the Biosciences Diversity Program, provided an update on diversity in graduate education. She reported the sobering statistic that, between the years 1994 and 2003 the University as a whole experienced a 21% growth in graduate school applications but a 41% drop in the number of minority applications. Several of our peer institutions, in contrast, have seen increases of 3-35% in minority applicants. We clearly need to – and want to do better in this area.

Ms. Griffin went on to describe the recruitment strategies she and others are using to improve our success in recruiting underrepresented minority graduate students. These include travel to historically black undergraduate colleges and other minority serving institutions, attendance at national conferences where underrepresented minority students present their scientific work and meet with faculty, the Stanford Summer Research Program, the development of partnerships with other institutions such as the Meyerhoff Connection with the University of Maryland, Baltimore County, Graduate Diversity Admit Weekend, and the Cancer Biology High School Program. Plans for the future include an Initiative for Minority Student Development Grant (IMSD) and increased faculty involvement with recruitment.

Clearly this is a work in progress and we are eager for some of the programs now being put in place to improve diversity to reach fruition – and improved success.

Thank you from the Lucile Packard Children's Hospital

The Dean's office received the following letter from Colette C. Case, Director of Child and Family Life Services and we would like to share it with you:

"I wanted to personally thank all of you for the wonderful gifts you contributed to the patients at Packard Children's Hospital. It was amazing how many gifts you were able to donate during the Holidays!!

We had a "full house" on Christmas so Santa was very happy to have so many wonderful gifts to choose from so he could give every child a bag of toys that was just right for their age and wishes. For those children who do not celebrate Christmas, we were able to give them unwrapped gifts that they were able to enjoy.

I hope you all had a wonderful Holiday Season and wish you a Happy New Year!! Hope we hear from you again next year".

Honors and Awards

- **Dr. David Gaba**, Professor of Anesthesia, has been named the 2003 recipient of the VHA's prestigious David M. Worthen Award for Academic Excellence in recognition of the VA employee who has made a "major contribution of national significance toward education in the health professions." Please join me in congratulating Dr. Gaba.
- **Fulbright Scholar Grants** have been awarded to three individuals who will either visit Stanford or travel to a foreign country. These include:

- **Stine Sofia Korreman** a Scientist from the Department of Radiation Physics from the National University Hospital, Copenhagen, Denmark (who is visiting Stanford from August 2003 – April 2004)
- **Karin Berit Petersson**, a doctoral candidate in the Department of Molecular Biophysics, Center for Chemistry and Chemical Engineering, University of Lund, Sweden (who is visiting Stanford from August 2003 – July 2004)
- **Ira Glick**, Professor of Psychiatry and Behavioral Sciences at Stanford who will be visiting the National Institute of Mental Health and Neurosciences, Bangalore, India from January 2004 – July 2004.
- **Dr. Marilyn Winkleby**, Associate Professor (Research) of Medicine at the Stanford Center for Research in Disease Prevention and, by courtesy, of Health Research and Policy and Julia Steele have published a new book entitled *Healing Journeys: Teaching Medicine, Nurturing Journeys* that tells the story of the Stanford Medical Youth Science Program that was founded in 1988.
- **Dr. Irv Weissman**, Karel and Avice Beekhuis Professor of Cancer Biology, Professor of Pathology, Developmental Biology and, by courtesy, of Biological Sciences, has been awarded the 2004 Jessie Stevenson Kovalenko Medal from the National Academy of Sciences “for his seminal studies that define the physical properties, purification, and growth regulation of multipotent hematopoietic stem cells”. He will also receive the Alan Cranston Award from the Alliance for Aging – both adding to his ever-increasing list of major awards!
- **Dr. Daniel Palanker** and his research group from the Department of Ophthalmology, received a prestigious award at the International Society for Optical Engineering Conference 2004 in San Jose, for their work on the artificial vision chip. Their paper “Attracting Retinal Cells to Electrodes for High Resolution Stimulation” won the first place and the Pascal Rol award for the best paper and presentation on Ophthalmic Technologies Conference. Congratulations to all involved!

Announcements

- **SUMMA: The Stanford University Minority Medical Alliance:** On January 31st Stanford will host the annual SUMMA Conference that will engage 550 college underrepresented minority students and 100 high school students who are interested in pursuing a career in medicine. SUMMA is run entirely by medical students – with several dozen working on the preparations for the upcoming event. The day will consist of presentations, mock interview sessions, information sessions about the MCATs, the application process, etc. It is a wonderful event and has a long history of helping to open of the pipeline of interest among minority students to a career in

medicine. If you are interested in more details you can view the Website <http://med.stanford.edu/osa/summa/>.

- **Community Lecture Series:** On Wednesday, February 4th, Mary Lake Polan, M.D., Ph.D., Chair, Department of Obstetrics and Gynecology, will present Human Sexual Function: Mind-Body Connection at the next monthly lecture in this very successful series. Dr. Polan will examine how the peripheral sexual response interacts with central nervous system changes. Studies using fMRI to track brain activation seem to show a close tie between genital blood flow and sexual response. Please join us in the Fairchild Auditorium at 7:00 p.m. for this lecture. If you have any questions, please call 650-234-0647.

Dean's Newsletter

February 9, 2004

Update on the Strategic Planning Retreat

From January 29-31st, approximately 75 members of the Stanford Medicine community gathered at the Carmel Valley Ranch for our Third Strategic Planning Retreat. The first of these Retreats was held in early February, 2002 and offered the opportunity to further develop our School-wide Strategic Plan entitled "Translating Discoveries" (<http://medstrategicplan.stanford.edu/>). Since then we have been working diligently to implement the various initiatives we identified in key mission based areas. At this year's Retreat we had the opportunity to present updates of our progress as well as to engage the attendees in some critically important questions and issues that impact Stanford now and in the future.

As with our past two Retreats, this year's event brought together a diverse community, including Department Chairs, Institute Directors, Senior Deans, School Leaders, University Officials (including the Provost, Trustees), Hospital CEOs and representative medical and graduate student leaders as well as leaders from the Residency Training Program and clinical and research Fellowship Programs.

As reported in the last edition of the Dean's Newsletter, the agenda was quite intense and demanding – making for long but productive days.

This year we also had the privilege of having Dr. Jordan Cohen, President of the Association of American Medical Colleges (AAMC), join us for the Retreat and present his views about the challenges facing academic medicine in the 21st Century.

From the feedback I have received, I would rate this year's Retreat as a wonderful success. The attendees were clearly energized by the progress that we are making and seemed truly pleased to be part of an initiative that is helping make Stanford a role model among research-intensive academic medical centers. They also had the opportunity to present an important and diverse set of views and perspectives, enabling us to learn from

each other and help chart our course for the years ahead. Indeed, in our small group breakout sessions – and then group wide discussions – we had the opportunity to identify some of our most important challenges and to begin identifying ways of making progress for the future.

In the brief report that follows I want to highlight some of the discussions that took place at the Retreat. In the very near future we will have the presentations that were given at the Retreat posted on our Web Site (<http://med.stanford.edu/dean/>).

I also want to take this opportunity to thank everyone who presented at the Retreat or who participated in the discussions that unfolded. In addition, I want to offer special thanks to Mr. David O'Brien, Director of Institutional Planning, who did a spectacular job in helping us prepare for the Retreat (including helping to summarize what transpired) as well as keeping our Strategic Planning efforts moving forward. Finally, I want to thank Ms. Sharon Olsen, Executive Associate to the Dean, for all the special efforts she put forth to help make the Retreat such a wonderful experience for all.

Medical Education

Julie Parsonnet, M.D., Senior Associate Dean for Medical Education, presented "*Medical Education – Towards a Medical University*".

Dr. Parsonnet provided a review of major accomplishments in Medical Education in 2003, including the initiation of the new Stanford Curriculum, a Faculty Senate Committee on Performance Assessment and Advising, and a new funding mechanism for the Office of Continuing Medical Education. She also reported excellent results in our admissions yields and our residency matches.

She also presented an in-depth review of the Scholarly Concentrations, the structure of the new curriculum and the developing mechanisms for curriculum evaluation.

She concluded with a presentation of objectives for Medical Education in 2004, including the continued implementation of the new curriculum, improvements to student evaluations, incorporation of residents and fellows into the scholarly concentrations, developing mechanisms to facilitate and foster excellence in teaching, and developing a more robust CME program.

Discussions following the presentation addressed issues associated with the integration of our medical and biosciences graduate programs, the importance of ensuring that our admissions criteria reflect the types of students most appropriate to the new curriculum, and the importance of evaluating the "hidden curriculum" that represents what students are actually learning through all modalities.

Graduate Education and Postdoctoral Training

John Boothroyd, Ph.D., Senior Associate Dean for Research and Training, presented *“Flexible Strength in Graduate Education”* and *“Postdoctoral Training: Building on Excellence”*.

Dr. Boothroyd reported on the high levels of graduate student satisfaction with their decision to attend Stanford, but also laid-out an agenda for improvements in the areas of graduate student diversity, increased flexibility for 1st year students and increased strength in interdisciplinary training.

He also reported on a number of planned initiatives designed to make the postdoctoral scholar/scientist career an attractive choice, to promote increased diversity among postdoctoral scholars, and to foster successful career transitions from postdoctoral scholar to independent scientist.

He identified a continuing commitment to developing additional mechanisms to increase the exposure of graduate students and postdoctoral scholars to clinical medicine and translational research.

He concluded his presentation by soliciting discussion around the issues of increased graduate student and postdoctoral scholar diversity, increased exposure to clinical medicine and translational research, increased teaching opportunities for students and fellows, and improved mentoring.

Discussions following the presentation ranged widely across these issues as well as issues of housing affordability for postdoctoral scholars, limitations on the duration of postdoctoral training, and opportunities for clinical exposure.

Graduate Medical Education and Postgraduate Medical Education

Harry Greenberg, M.D., Senior Associate Dean for Research and Training, presented *“Opportunities for Change in Graduate and Postgraduate Medical Education”*.

Dr. Greenberg provided an overview of the student and trainee types within in the School’s medical and graduate biosciences programs. He noted a surprising degree of symmetry among our programs, with medical students and biosciences graduate students being roughly equal in size and total pre-degree students being about 50% to size of total post-degree trainings. He reported a current total School of Medicine student and trainee population of approximately 2,820. He also summarized the complexity of the academic and administrative organizations currently involved in support of these students and trainees.

He summarized the charge and key findings of the Dean’s task force on Residents and Fellows, including the need to strengthen the decanal role in these programs, the need to develop “customer service” oriented administrative structure, and the need to develop and oversee SUMC program standards, including elements of increased scholarship.

He concluded by delineating specific future goals for our GME/PGME programs, including addressing the specific Task Force recommendations, providing research opportunities similar to the scholarly concentrations, and developing a strategic plan for all our trainees. One of the major goals will be to extend the Scholarly Concentrations that have been developed for medical students into the Residency and Fellowship programs

Academic Affairs

David Stevenson, M.D., Senior Associate Dean for Academic Affairs, presented *“Academic Affairs: Our Changing Professoriate”*.

Ken Cox, M.D., Senior Associate Dean for Clinical Affairs (Pediatrics and Obstetrics), presented *“Clinician Educators: Critical Workforce For the Success of Stanford’s Clinical Programs”*.

As background, Dr. Stevenson summarized the history of the Medical Center Line and its recent refinements, the major additional revisions to the professoriate accomplished in 2003, and the current resultant structure and composition of the faculty (and related) positions at the School of Medicine. He also summarized the practical effects on the School of the new faculty billet cap and presented comparative data on faculty size and rank for Stanford and our peer research-intensive medical schools.

Dr. Stevenson also presented 3 key areas for new initiatives in 2004. These included a change in our faculty resource orientation from one of “billet control” to one of “position management”, the continued transformation of the Office of Academic Affairs into a proactive and consultative service function, and the development and implementation of a new Faculty Leadership Development Program for all School of Medicine faculty.

Dr. Cox then reported on the work findings and recommendations of the recently appointed Clinician Educator (CE) Task Force, which he chaired. He began by summarizing the current status of clinician educators and the objectives of the Task Force. These included clarification of CE compensation and benefits relative to their peers (both academic and non-academic) and identification of existing barriers to the full utilization of these appointments.

Dr. Cox presented data on the numbers and distribution of CE by rank and by duration of appointments, by the percentage FTE of their appointments, and by their distribution among departments.

He summarized the current state of the issues, and their potential resolution, for the key areas of concern to the CE: creating a valued position, providing opportunities for a competitive salary, and providing a fair and competitive benefits plan that includes housing and professional/sabbatical leave provisions.

The discussions that followed these two presentations addressed issues relating to the key roles of CE as educators and clinicians, the role of “Instructor” as a transitional appointment for future faculty, the potential role of the VA as a model for non-faculty academic roles, and the key role of CE in the success of the hospitals.

Finance and Administration

Mike Hindery, Senior Associate Dean for Finance and Administration, presented *“Finance and Administration: NOT Lost in Translation”*.

Mr. Hindery’s presentation included a summary of significant 2003 accomplishments, a description of the rationale and structure of a proposed new management model for academic units, and a summary of key initiatives planned for 2004.

Most notable among the reported accomplishments in Finance and Administration were the development and implementation of new formulas for school operating budget allocations and for a university “citizenship tax”, continued implementation of university administrative information systems, development of an SUMC facilities master plan, and continued improvements to employee retention and respectful workplace programs.

Mr. Hindery summarized the most significant internal and external factors that are affecting the administrative work of the Medical School. These include the proliferation of departmental and non-departmental academic units, the workload burdens of new information systems and compliance obligations, and our efforts toward increased interdisciplinary activities. He outlined a proposed administrative model that allows for a more flexible and efficient response to these challenges while preserving the critical roles of departmental administration in support of the faculty’s programs.

Plans for 2004 include further discussions of the administrative model and additional pilot programs, a comprehensive review of the school’s operating, consolidated and capital budgeting processes, continued administrative systems implementation, continued refinement of funds flow formulas, and increased efforts to create and promote programs contributing to an appropriate work-life balance.

The discussions that followed addressed many issues associated with the proposed administrative model, in particular the role of the DFA and the critical nature of the DFA-Chair relationship.

Invited Speaker

Jordan Cohen, M.D., President, Association of American Medical Colleges, spoke on *“Contemporary Challenges For Academic Medical Centers”*.

Dr. Cohen introduced the key challenges confronting the primary missions academic medicine, delineating the factors behind these challenges and their likely implications on

medical schools. He commended the efforts underway at Stanford, suggesting that they represent thoughtful and appropriate responses to many of these challenges.

Information Resources and Technology

Henry Lowe, M.D., Senior Associate Dean for Information Resources and Technology, presented *“Information Resources and Technology”*.

Dr. Lowe reviewed the primary goals of IRT and the IRT development model, as articulated last year, and steps taken during 2003 toward achieving those goals. He then presented the key plans for 2004 in each of IRT’s functional areas (IT Security, Desktop Support, Website applications, Wireless computing, Knowledge Management, Learning Technologies, translational research data systems, and clinical informatics).

Important IRT initiatives featured by Dr. Lowe included the implementation of a “trusted network” model to enhance medical school security, the development of a “hub and spoke” IT support model for desktop support, continued implementation of the new School of Medicine web architecture and supporting systems, development of an integrated and centrally managed School wireless network, the development of a Knowledge Management strategic plan, the continued development of a translation research data repository and the development of plans for a medical school Center for Clinical Informatics.

The subsequent discussions expressed support for IRT’s efforts to collaborate with SHC and LPCH. Support was also expressed for the planned data repository and the development of a desktop support service.

Government, Public Affairs and Communications

Ryan Adesnik, Director of Government Relations, and Paul Costello, Executive Director of Communications and Public Affairs, presented *“2004 – Collision Course? Defending Science from Politics”*.

Mr. Adesnik and Mr. Costello described the current national climate as it relates to public policy and support for science. They provided a number of specific examples of recent efforts to politicize the traditionally impartial deliberations over funding priorities and individual grant applications. They presented an inventory of key initiatives likely to come before Congress in 2004 that could have significant consequences on the nation’s scientific priorities. These included the FY05 NIH funding authorization, a potential comprehensive NIH reauthorization, and additional efforts to secure legislations banning human reproductive and therapeutic cloning.

They concluded with a call to action by the school’s faculty and offered a faculty program of media training and media appearances, editorial board briefings, Op/Ed pieces, high profile speaking engagements and participation on campus tours and in

policy forums. They highlighted some key successes in 2003 resulting from efforts such as these.

The discussion that followed reinforced the seriousness to the threats and the importance of action by the entire community, including faculty, leaders and students.

Stanford Hospital and Clinics and Lucile Packard Children's Hospital

Martha Marsh, President and CEO of SHC, presented "*Stanford Hospital and Clinics and Stanford University School of Medicine: Partners in Translational Medicine*".

Norm Rizk, M.D., Senior Associate Dean for Clinical Affairs (Adult), presented "*Clinical Programs Strategic Planning*".

Chris Dawes, President and CEO of LPCH, and Ken Cox, Senior Associate Dean for Clinical Affairs (Pediatrics and Obstetrics), presented "*Lucile Packard Children's Hospital Update to Stanford University School of Medicine Leadership Retreat*".

Ms. Marsh provided a status update on the programmatic and financial status of SHC, including a summary of key efforts undertaken since 2002 that have lead to a much-improved situation. She expressed caution, however, about the significant challenges still ahead. Most notable among these are continued pressures on the costs of care, the importance of quality of care, increasing barriers to access to care at Stanford, and local competitive threats.

She outlined an SHC success strategy that would unite the joint interests of SHC and the School in translational research and medicine in the development of clinical centers of excellence with close ties to the school's planned institutes. With concurrent SHC management efforts in quality and service initiatives, joint investments in new markets and a renewed capital investment program, Ms. Marsh felt confident that these efforts would lead to the continued strengthening of SHC.

Dr. Rizk provided a summary of the recent financial and program activities of the faculty's outpatient services. He also reviewed the options that were discussed a year ago for maintaining our patient base and changes that have occurred that directly effect (and reduce) the options available to the faculty and medical center. He presented the proposition that, to succeed, we must position ourselves as the quality and value leader in healthcare – that SHC must become the "must have" provider for local employers' health plans because patients demand access to SHC.

Dr. Rizk outlined the key institutional initiatives that are required in order for this strategy to succeed. These included recognizing and promoting the unique talents of our faculty, developing more functional business relationships between and within the School and SHC, eliminating current barriers between clinical departments through the creation of clinical centers and other interdisciplinary ventures, and making a reality of the promise of translational research and medicine.

Mr. Dawes described the transformation that has occurred at LPCH during the past 5 years reflecting concerted efforts to achieve their long-term goals of Preeminence and Sustainability. He noted, in particular, the role of the Children's Health Initiative in supporting coordinated investments in LPCH Information Systems, Core Programs, Centers of Excellence, Regional Programs of Excellence, and Critical Programs and Services. He also stressed the value of the alignment between the LPCH Centers of Excellence and the School's Institutes.

Dr. Cox provided an update on the successful development and implementation of faculty practice organization for Pediatrics and Obstetrics faculty at LPCH. He outlined the underlying rationale for the FPO and its key organizational features and put forward the major objectives for the FPO in 2004. These include a series of programs to improve patient access, patient satisfaction, clinical facilities, and billing and contracting.

Mr. Dawes then concluded with a summary of the LPCH priorities for the next 5 years. These include building and maintaining programmatic momentum in key clinical areas and undertaking the systematic implementation of a multi-year, multi-phased facilities renewal program to ensure the continued availability of children's services in the community.

During the discussion period questions were raised about the competitive challenges from Sutter, Kaiser and UCSF and the relative priorities of primary/secondary care and tertiary/quaternary care for preserving our patient bases. There was also an extended discussion of the roles that the School's CME programs could play in securing physician alliances. The importance of developing an adult FPO comparable to that underway at LPCH was reinforced by a number of individuals.

Enabling Translation (Panel)

Phil Pizzo, M.D., Dean, presented "*The Faculty Interests Survey – 2003*".

Irv Weissman, M.D., Director, Cancer/Stem Cell Institute, presented "*The Institute for Cancer/Stem Cell Biology and Medicine*".

Karl Blume, M.D., Associate Director, Cancer/Stem Cell Institute, presented, "*NCI-Designation of Stanford University as a Comprehensive Cancer Center*".

Bill Mobley, M.D., Ph.D., Director, Neurosciences Institute at Stanford, presented "*Neurosciences Institute at Stanford (NIS)*".

Judy Swain, M.D., Chair, Department of Medicine, presented, "*Stanford Cardiovascular Institute*"(SCVI).

Ann Arvin, M.D., Associate Dean for Research, presented, "*Stanford Immunology, Transplantation Biology and Infection Institute*"(SITI).

Paul Yock, M.D., co-Chair, Department of Bioengineering, presented "*Program in Biodesign*".

Dr. Pizzo briefly summarized selected findings from the 2003 survey of medical school faculty. He noted that the survey had a very high (64%) overall response rate. From the survey, he showed that faculty, on average, indicated an affinity for 9 of the 20 affinities

areas indicated. The 4 planned institutes encompassed the medium-to-high interests of 84% of the faculty. Including programs in Bioengineering and Genetics/Genomics increased this number to 90% of the school's faculty. He concluded that the school's plans for interdisciplinary initiatives were appropriately targeted to be inclusive of the faculty's interests.

Dr. Weissman described the recent scientific and organizational history of Cancer/Stem Cell activities at Stanford and offered a number of examples of on-going areas of Discovery leading to Translation and on to Therapy. He concluded with a presentation of emerging active collaborations in cancer/stem cell related areas.

Dr. Blume provided an update on the impressive efforts underway to achieve NCI designation as a comprehensive cancer center. He also detailed some of the programmatic and core resources areas encompassed within the NCI proposal.

Dr. Mobley presented the vision for the NIS and elaborated on its relationships to existing neurosciences activities at Stanford. He also described the unique role of NIS in facilitating translational activities among existing and future neuroscientists and outlined how the operating principles embraced by NIS will make this possible.

Dr. Swain described the mission, focus and organization of the SCVI. She put forward the SCVI "Grand Challenge" of improving the outcome from heart failure and discussed how the SCVI model would provide unique opportunities to meet this, and subsequent, challenges.

Dr. Arvin described the principles of the SITI and its unique orientation and scope among the planned institutes. She elaborated on each of the four centers planned within the institute and described their potentials for discovery and unique impacts on science and clinical care. She concluded with a discussion of the predictors of success for the institute.

Dr. Yock provided an overview of the unique organization and initiatives undertaken through the Biodesign Program, focusing on innovation and effective models for technology transfer. He also described program's innovative training opportunities.

During the discussion period, Rick Myers (Chair, Department of Genetics) described recent efforts among the faculty to define an interdisciplinary initiative in Human Genetics. He indicated a great deal of interest among the faculty and significant opportunities for training and translational research.

A number of observations were made about the need for programmatic flexibility and responsiveness by the institutes in order to enable them to succeed in filling the ever changing gaps between the more static departmental structures.

The innovative approaches to training and translation sponsored by the Biodesign Program were noted as models for similar efforts within the institutes.

SEMC and Development

Phil Pizzo, M.D., Dean, presented “*Translating Our Vision and Goals into Reality: Capital and Programmatic Planning*”.

Dr. Pizzo reviewed the state of SUMC facilities planning a year ago and outlined what has changed (and what has not changed) during the intervening period. He then described the major goals of the current School of Medicine Master Facilities Plan and how they are reflected in the near-term in the SEMC projects and how they will be played out in the years following the SEMC. He described in more detail the completed work to-date on the SMILE project and the plans under development by LPCH for facilities renewal and development in Palo Alto. He concluded the facilities portion of his presentation by reintroducing the question of a second campus – to be discussed further during the breakout sessions.

Dr. Pizzo also presented an overview of the development efforts that have been undertaken since the last retreat. He used, as an example of integrated planning, development efforts around the Cancer/Stem Cell Institute and the SHC Clinical Cancer Center. He concluded by laying out the challenges for a successful effort to raise funds for the school’s key strategic goals.

Breakout Sessions

The retreat participants were divided into 7 breakout groups. Each were assigned 2 discussion areas from the following list:

- ***Extending our Education Mission***
- ***Extending our Patient Care Mission***
- ***Extending our Research Mission***
- ***Extending our Faculty and Roles***
- ***Extending our Campus***
- ***Translating our Vision and Goals into Reality: The Importance of Philanthropic Support.***

Each group was facilitated by a Senior Associate Dean and supported by a staff member to record the group’s discussion.

Working off a list of exemplary questions for each assigned discussion area, the groups were asked to develop brainstorming ideas, identify significant challenges and supporting factors, and develop up to 5 specific recommendations for action.

Spokespersons for each discussion area then summarized the group’s discussion and key action ideas. These presentations were transcribed by a facilitator onto a very large and comprehensive template. Throughout an extended “town hall”-type discussion period, these action ideas were further elaborated and diagramed. At the conclusion of the retreat, participants were asked to mark the six action items they felt were most important

and/or that they would be willing to commit to personally supporting – through their own time and energy.

The results of these presentations and indications of interest and support are currently in the process of being tabulated. The preliminary data indicate that six initiatives received 60% of the votes and include specifically:

Clinical Programs

1. Improving the overall patient experience at SHC and LPCH
2. Developing an adult Faculty Practice Organization analogous to that now being implemented in pediatrics
3. Establishing a viable career path for “Clinician-Educators”

Research

4. Critically determining the benefits for developing a second campus
5. Incorporating the “biodesign model” into other features of our institutes and research programs

Education

6. Making the institutional changes necessary to promote student and faculty diversity

Next steps

Over the next several weeks we will refine the action items emerging from the Retreat and further prioritize our plans for the next year and those that follow. We have clearly made significant progress in a number of key areas – but we have much work to do to achieve our key goals and objectives. Among these, further improving our clinical programs and the integration of the School with SHC and LPCH stand as among the most important priorities. Coupled with this is being able to develop the resources, from both the public and private sectors, to enable us to fulfill our programmatic and facility requirements that will permit us to be optimally successful in *Translating Discoveries*.

Honors and Awards

Dr. Stuart Goodman, Professor of Orthopedic Surgery, has been elected as a Fellow, Biomaterials Science and Engineering, in the International Union of Societies, Biomaterials Science and Engineering. He will be officially inducted at the 7th World Biomaterials Congress in May, 2004

Dr. Irv Weissman, Karel and Avice Beekhuis Professor of Cancer Biology, will receive the Alan Cranston Award from the Alliance for Aging Research on April 1, 2004. It should also be noted that the Alliance will host a public conference on stem cell and regenerative medicine research on April 1st that will feature prominent and respected scientists, ethicists, and thought leaders. This is an excellent program that I hope members of the Stanford community will attend. For details you can visit the website www.agingresearch.org

Dr. Eugene Butcher, Professor of Pathology, has been named the co-winner (with Tim Springer of Harvard) of the Crafoord Prize for his research on white blood cells. This award, named for Holger Crafoord, who designed the first artificial kidney, has been given annually since 1982 for scientific research in areas not recognized by the Nobel Prizes, including mathematics, astronomy and biosciences. King Carl XVI Gustaf will present the award Sept. 22 in Stockholm.

Dr. Michael Longaker was recently honored on becoming the Deane P. and Louise Mitchell Professor in the School of Medicine

Dr. David Stevenson, Harold K Faber Professor of Pediatrics, Senior Associate Dean for Academic Affairs and Director of the Johnson Center for Pregnancy and Newborn Services, has been elected Vice President/President Elect of the American Pediatric Society – he will assume the role of President in 2005-2006. The American Pediatric Society, which was founded in 1888, is the oldest pediatric society in the United States.

Events

Opening of the Cancer Center. On Wednesday evening, February 4th, a Gala was held to herald the opening of the new Stanford Cancer Center, which opens for patient care on March 1st. Approximately 600 guests attended the Gala and had the opportunity to tour the wonderful new facilities. The event was hosted by Ms. Martha Marsh, President and CEO of SHC and featured introductions by President John Hennessy, Dean Phil Pizzo and Trustees Isaac Stein and Denise O'Leary (who also serves as Chair of the Board of Directors of SHC).

Faculty Meeting with Department of Surgery. On Monday, January 26th, I had the opportunity to attend the Faculty Meeting for the Department of Surgery and heard presentations by each of the Division Chiefs on the progress that has been made in the past several years in education, research and patient care programs. There is no question that the Department of Surgery has undergone considerable change, in part due to a number of important new recruitments, and that it is now performing at an ever-increasing level of excellence. Thanks must go to Dr. Tom Krummel for the efforts he and his colleagues have made in helping the Department to achieve such continued improvements.

Community Lecture Series. In our continuing lecture series to educate the community about important research findings or issues impacting patient care, Dr. Mary Lake Polan, Katharine Dexter McCormick and Stanley McCormick Memorial Professor, lectured on *Human Sexual Function: Mind-Body Connection* on Wednesday February 4th.

LPFCH Series on Translational Medicine. On Thursday, February 5th, the Lucile Packard Foundation for Children's Health, held a community education event featuring faculty engaged in Translating Discoveries. This is an important way to

help engage our community in the exciting work going on in the School of Medicine and at the Lucile Packard Children's Hospital.

Announcements

- ***The Albion Walter Hewlett Award was developed by the Department of Medicine as a recurring award to honor an extraordinary physician with ties to Stanford. Nominees are welcome from all departments and are not confined to the Department of Medicine. The award committee invites your nomination for a possible award presentation in 2004. Nominees should be from among those living who have made a substantial investment in Stanford (past or present students, house officers, fellows or faculty) and who have consistently, over decades, demonstrated the exemplary combination of a scientific approach to medicine and sensitivity to patients. They should be consummate physicians and role models for future academicians in medicine. Their work should be well known at least at Stanford and, optimally, nationally. Deadline for nominations is due on March 1st. For more information please check out the website at <http://medicine.stanford.edu/hewlett/>.***
- ***The Gustavus and Louise Pfeiffer Research Foundation, in conjunction with***
The Stanford University School of Medicine and Center of Excellence, cordially invite you to attend the *2004 Winter Quarter Visiting Professor Lecture Series* on Thursday, February 12, 2004, at noon in the Clark Center Auditorium with reception to follow. Kristy Freeman Woods, M.D., M.P.H., Professor of Medicine and Director of the Maya Angelou Research Center of Minority Health, Wake Forest University School of Medicine, Winston-Salem, North Carolina, will present *Understanding Racial and Ethnic Health Disparities*. For more information, please contact the Center of Excellence at (650) 725-0403.
- ***13th Annual Jonathan King Lectureship will be held on Wednesday, February 11, 2004, in the Fairchild Auditorium from 5:00 - 6:00 PM. The speaker Eavan Boland, The Bella Mabury and Eloise Mabury Knapp Professor in Humanities, The Melvin and Bill Lane Professor, Director Creative Writing Program, Stanford University, will present The Science of Curing and The Art of Healing: A Poet's Experience. She will talk about a writer's view of perceptions of language and senses of survival in a hospital environment, drawn from experiences in the arts program of an Irish hospital. Professor Boland will discuss the importance of the language of hope in a terminal environment. Please contact the Center for Biomedical Ethics at 650-723-5760 for further information or visit their website at <http://scbe.stanford.edu>.***

Appointments and Promotions

- **Jennifer Abidari** has been reappointed to Assistant Professor of Urology at the Stanford University Medical Center, effective 11/1/2004.
- **Rajni Agarwal** was appointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 2/1/2004 to 1/31/2007.
- **James Andrus** was appointed to Assistant Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 2/1/2004 to 1/31/2007.
- **Stephen Baccus** has been appointed to Assistant Professor of Neurobiology, effective 3/1/2004 to 2/28/2007.
- **Maxwell Boakye** was appointed to Assistant Professor of Neurosurgery at the Palo Alto Veteran's Affairs Health Care System, effective 2/1/2004 to 1/31/2007.
- **Brendan Carvalho** was appointed to Assistant Professor of Anesthesia at the Stanford University Medical Center, effective 2/1/2004 to 1/31/2007.
- **Guowei Fang** has been reappointed to Assistant Professor of Biological Sciences, 12/30/2003 to 12/29/2007.
- **Paul Fisher** has been promoted to Associate Professor of Neurology and Neurological Sciences and of Pediatrics and Associate Professor, by courtesy, of Neurosurgery at the Stanford University Medical Center, effective 2/1/2004 to 1/31/2009.
- **Kelly Gaffney** has been appointed to Assistant Professor at the Stanford Synchrotron Radiation Laboratory, effective 2/1/2004 to 1/31/2008.
- **Susan Galel** has been reappointed to Associate Professor of Pathology at the Stanford University Medical Center, effective 9/1/2004.
- **Lauren Gerson** has been reappointed to Assistant Professor of Medicine (Gastroenterology and Hepatology) at the Stanford University Medical Center, effective 10/1/2004.
- **Harcharan Gill** has been reappointed to Associate Professor of Urology at the Stanford University Medical Center, effective 9/1/2004.
- **Teri Longacre** has been reappointed to Associate Professor of Pathology at the Stanford University Medical Center, effective 1/1/2005 to 12/31/2008.
- **Andrew Patterson** has been reappointed to Assistant Professor of Anesthesia at the Stanford University Medical Center, effective 2/1/2004 to 1/31/2008.
- **Midori Yenari** has been promoted to Associate Professor (Research) of Neurosurgery, effective 2/1/2004 to 1/31/2010.

Dean's Newsletter

February 23, 2004

Public Policy Forum Visit with Senator Arlen Specter

On February 19, 2004, the School of Medicine hosted a policy forum discussion with Senator Arlen Specter, Chairman of the Labor, HHS and Education Appropriations Subcommittee, the congressional committee that makes yearly federal funding and policy decisions for the NIH. During his leadership of the subcommittee he has worked with Senator Tom Harkin to increase the NIH budget from \$12 billion to \$28 billion. During his visit, Senator Specter gave a presentation that addressed a wide range of topics that impact biomedical research and health care. He also participated in a spirited question and answer session with faculty and staff.

The Senator's visit coincided with the release of a new report from the Union of Concerned Scientists, a group of 60 influential scientists including 20 Nobel laureates, detailing the negative impact of actions at the federal government level that have modified scientific research to accommodate political and ideological goals. The campaign by the Union of Concerned Scientists, "Restoring Scientific Integrity," has been launched with this open letter calling for regulatory and legislative action "to restore scientific integrity to federal policymaking." Stanford's Dr Paul Berg, Robert W. and Vivian K. Cahill Professor of Cancer Research, Emeritus was one of the individuals who signed this letter.

Senator Specter also spoke passionately about his work to protect and strengthen the NIH budget and to defend stem cell research in the face of opposition from budget cutters and from those who would adversely impact the peer review process for goals unrelated to science. He clearly demonstrated his courage and commitment to challenging issues – and to serving as a champion of biomedical research, including controversial areas like stem cell research.

Drawing an analogy describing the opposition we face today to the time of Galileo, Senator Specter urged those in the science and research communities to actively engage in public debate on these important issues. During the discussion, he recounted his unsuccessful attempt last year to add an additional \$1.8 billion to the NIH budget. That effort failed by eight votes. Looking back on that effort, the Senator strongly emphasized that each of us in the research and higher education community needs to communicate with our legislators on a much more frequent and effective basis, similar to the way private sector interests make their priorities known in Washington.

We are at an important time in our effort to improve the quality of life of people who suffer from disease. We will be planning additional public policy forums in the future and I hope you will be able to participate whenever possible. I also hope that you will join me in the effort to advocate for policies that will give us the best opportunity to succeed in this endeavor.

The Impact of the University-Wide Information Systems Conversion

Virtually every member of our community has been negatively impacted by the Delphi Project and the Oracle Financial System conversion that commenced last September. While there is no question that the older financial systems needed to be replaced, the current conversion has resulted in major issues and equally importantly (and sadly) a serious morale problem among staff and faculty. This largely stems from the inability to generate accurate and timely financial reports or to order or reimburse vendors and personnel for orders and other services. Further, for nearly all staff, the workload has gone up in parallel with the frustration, anxiety and disillusionment. Because this matter is impacting the entire university, Chris Hanley, Chief Information Officer, and others, made a presentation to the University Faculty Senate on Thursday February 19th. He also answered questions in an executive session of the Senate.

Mr. Hanley attributed the current problems to a number of converging issues, among which was the decision to proceed with a total implementation (which he referred to as the “big bang” approach) rather than a phased in series of implementations. That resulted in a situation in which nearly everyone was learning at the same time. There was also an underestimate of the amount of resources that would be necessary to address the problems that arose further limiting the ability of IT staff to address the extraordinary number of questions or problems that arose with the conversion.

It was acknowledged that the current status was unacceptable and that it was necessary to manage the project differently – by both adding resources to focus on key tasks (e.g., reporting, functionality, data integrity and quality, daily support) as well as prioritizing design solutions. It is hoped that additional resources will improve the reporting performance, making the help desk more responsive and reducing transactions. While Mr. Hanley and his team also proffered that they felt they were turning a corner and that the January reports would show improvement, the general reaction from faculty was suspended confidence. Indeed, it was acknowledged by all that it is critical to get the turn around accomplished as rapidly as possible and to offer the Stanford community regular communications updating the progress being made (or where problems still exist).

To help our own School of Medicine community, a series of Town Hall Meetings on this topic will be led by Mr. Mike Hindery, Senior Associate Dean for Finance and Administration, to discuss issues and problems related to the Delphi project and Oracle financial system implementation. **There will be two Town Hall Meetings scheduled next week: Tuesday, February 24th from 3 to 4 PM and Wednesday, February 25th from 10 to 11 AM in Munzer Auditorium in the Beckman Building.** The purpose of these meetings is to obtain feedback from faculty and staff regarding the Delphi Project and the Oracle Financial System. You are encouraged to attend one of these meetings to express your experiences (good and bad), issues, and frustrations with these systems to gain a better understanding of what issues others are facing. It is important that we know and understand your issues and experiences with these systems. Your role is important in supporting and assisting us to achieve the many tasks ahead. Please bring your specific concerns about how the systems implementation has impacted you or your department, as

we hope these sessions will inform us on issues to take to the University's Systems Governance meetings and to address internally where possible.

Updates from the Board of Trustees Meeting

One Monday February 9th, the Medical Center Committee of the Board of Trustees heard updates from Martha Marsh, President and CEO of Stanford Hospital & Clinics (SHC) and Chris Dawes, President and CEO of the Lucile Packard Children's Hospital (LPCH) on their financial performance. Both hospitals are currently showing very high occupancy rates and each hospital has a higher than budget financial performance. This is certainly good news and builds on the excellent performance that each hospital demonstrated in the last fiscal year. Indeed, SHC's continued positive performance has resulted in recent improvement in their credit rating. That said, both CEO's were careful to point out the numerous challenges that exist or that are on the horizon that could negatively impact their financials. But for now, it is highly encouraging to learn about these very positive results – a good portion of which is related to the work of our pediatric and adult clinical faculty.

We also gave updates to the Committee and Trustees on the progress we are making in further developing our Stanford Institutes of Medicine. Dr. Bill Mobley, Professor and Chair of the Department of Neurology and Director of the Neuroscience Institute at Stanford (NIS), spoke about the exciting developments taking place in fulfilling their vision of creating a new and transforming culture for neuroscience that:

- Involves scientists, clinicians, the University, the Hospitals and donors
- Motivates and supports fundamental neuroscience research and
- Translates neuroscience discoveries into enhanced care for patients with disorders of the nervous system.

The foundations that will help support the NIS goals of translational research (the process of applying ideas, insights and discoveries generated through basic scientific inquiry to the treatment and prevention of human disease and the process of taking insights developed through the study of human disease to generate new scientific insights) will include clinical care, education, basic, clinical and translational research and outreach. Thus the activities of the NIS (and other Stanford Institutes of Medicine) will include basic investigation, disease-oriented research, patient-oriented research, clinical trials and population research. Currently, the community associated with the NIS includes 140 faculty from 17 departments and 3 schools. The NIS will coordinate their activities through "theme groups" but the overarching goal will be to support the work of faculty and departments while stimulating a process that will promote translational research.

An update on the Stanford Institute for Immunology, Transplantation and Infection (IITI) was provided by Drs. Ann Arvin, Lucile Salter Packard Professor of Pediatrics and of Microbiology and Infectious Disease, and Dr. Larry Steinman, Professor of Neurology and Neurological Sciences and of Pediatrics and, by courtesy, of Genetics, both of whom

have been instrumental in the planning of the IITI. They have proposed the development of four centers that will comprise the IITI Including:

- The Center for Autoimmunity and Allergy
- The Center for Transplantation
- The Center for Microbe-Host Interactions
- The Center for Microbial Evolution and Global Emerging Infections

As with the other Stanford Institutes of Medicine, the IITI is committed to building translation research that will leverage decades of major institutional contributions in immunology, transplantation, microbiology and infectious disease. The IITI will facilitate translation by integrating basic research about immune mediated and infectious processes in human disease with clinical research about disease processes and methods to detect, prevent and treat immune-mediated and infectious diseases. Further the IITI will seek to create innovative programs in global infectious diseases that address their impact on human health and to enhance educational opportunities for medical and graduate students as well as postdoctoral scholars. The IITI is not defined by a specific disease or organ system. It will seek to create links between faculty within the School of Medicine as well as other Schools at Stanford, and it intends to create relationships with developing countries – recognizing the current challenges in clinical immunology, microbial pathogenesis, global infectious disease and biodefense.

Updates from the Executive Committee

At the February 6th Executive Committee we heard two departmental reports – one from Pediatrics and the second from the newly formed Department of Bioengineering. Following are brief summaries of these reports:

Department of Pediatrics

Dr. Harvey Cohen, Arline and Pete Harman Professor of Pediatrics and Chair of the Department, presented an update on the divisions and programs in Pediatrics. He gave a brief history of the department from the time it moved from San Francisco to Palo Alto in 1969 to the present. He then described the many clinical programs and research activities in the department.

Currently the department has 132 faculty and clinician educators in 14 divisions and six programs that cut across divisions. The department also has some 42 clinical post-doctoral fellows and 65 research post-doctoral fellows. The divisions are:

- Adolescent Medicine
- Allergy and Clinical Immunology
- Cardiology
- Critical Care Medicine, including the relatively new area of Pediatric Palliative Care
- Endocrinology
- Gastroenterology and Nutrition
- General Pediatrics

- Genetics
- Hematology/Oncology
- Infectious Diseases
- Neonatology
- Nephrology
- Pulmonary
- Rheumatology

In addition are crosscutting programs that include Immunology, Molecular Genetics, Developmental Biology, Cancer biology, Prevention, and Policy/Outcomes.

As Dr. Cohen highlighted the exciting clinical, basic research, and educational activities underway in each of the divisions and programs it became clear that the department is dynamic, growing, and deeply committed to the health of children in our local community, regionally, nationally, and even internationally. Thanks to Dr. Cohen for giving the Committee a glimpse of the extraordinary breadth and depth of work being done by the faculty, staff, and students in Pediatrics.

Department of Bioengineering

Dr. Paul Yock, Professor of Medicine and Co-Chair of the newly formed Department of Bioengineering, presented the history and current status of the department, which is jointly administered by the Schools of Engineering and Medicine. The Board of Trustees established the department in June 2002, and the Academic Senate of the University approved the MS and PhD degree programs in December 2003. The department is currently recruiting its first student class and is engaging in its initial faculty recruitments.

The mission of the department is "to create a fusion of engineering and the life sciences that promotes scientific discovery and the invention of new technologies and therapies through research and education." Its goal is to span the scale of the life sciences. The initial research theme was quantitative biology, and additional themes have come together around this initial one. They include biomedical computation, biomedical imaging, biomedical devices, regenerative medicine, and cell/molecular engineering. The clinical dimension of the department includes cardiovascular medicine, neuroscience, orthopedics, cancer care, neurology, and the environment.

The graduate curriculum is being developed for the first year class, which will arrive in September 2004. It will include a three quarter quantitative biology core and courses in each of the research theme areas. Dr. Yock pointed out that the challenge of educating bioengineers is that the breadth of areas encompassed in the field (biochemistry, chemical engineering, computer science, developmental biology, electrical engineering, genetics, etc.) can lead to considerable breadth but little depth. The goal of the Stanford department is to provide interdisciplinary knowledge and skills but also depth of understanding.

The department is currently located in the Clark Center and has ties with related programs that are part of Bio-X as well as other departments in both Engineering and the School of Medicine. Over the next several years it intends to develop an undergraduate

program, undertake additional faculty searches, and, some years down the line, fund-raising permitting, have a new building, which would be part of the Science, Engineering, and Medicine Campus (SEMC). Its goal is to be ranked near the top of bioengineering departments in a few years. This is an ambitious goal but one that the department is well on its way to achieving.

Medical School Faculty Senate Town Hall Meeting

At the Medical School Faculty Senate meeting on February 18th I provided a summary of our recent School of Medicine Leadership Retreat that was held from January 29-31. A narrative summary of the Retreat was presented in the February 9th Dean's Newsletter (see <http://deansnewsletter.stanford.edu/>). In addition, all of the presentations from the Retreat are now posted on our Web Site at <http://medstrategicplan.stanford.edu/>.

Following the discussion, we had the opportunity to engage in an open discussion focusing on some of the important issues that we have identified in education and faculty development.

Update from the Council of Clinical Chairs

At the Friday, February 13th Council of Clinical Chairs meeting Dr. Gerry Shefrin, VP for Ambulatory Programs at SHC, provided an update on the service incentive fund that is linked to the SHC and SOM Collaborative on improving access, efficiency and patient satisfaction in clinical office practices. A total of \$5 million from the overall funds flow allocations will be distributed to clinical departments based on performance in achieving various milestones to improve the aforementioned parameters. Further details will be provided later in the year.

In addition, we announced the plans to proceed with the formation of a Faculty Practice Organization for adult medical programs at SHC that will complement the one that is now being implemented for the pediatric faculty at LPCH. The goal is to complete the organizational planning regarding this FPO within the next 3-4 months. This will be lead by Dr. Norm Rizk, Senior Associate Dean for Clinical Affairs and Dr. Gerry Shefrin, VP for Ambulatory Programs at SHC. Based on the discussions that emerged at the Strategic Planning Leadership Retreat, there is considerable interest among Medical Center leaders (and, I am confident, among faculty in general) in such an organization. Clearly details will be shared as they develop.

New Health and Safety Training Program to Aid Compliance

We have received the following information from Arthur Bienenstock, Vice Provost and Dean of Research and Graduate Policy, and Larry Gibbs, Associate Vice Provost for Environmental Health and Safety.

Health and safety training is required to be provided to all personnel at the University. California state regulations make it the legal responsibility of supervisors and

managers, including faculty, to assure that individuals they supervise have been provided safety training and information appropriate to their workplace. In a large and diverse organization such as Stanford, this is often a challenging task.

To aid faculty and staff in fulfilling this responsibility to employees, visitors, and students working under their direction, the Environmental Health and Safety Department, in concert with the School of Medicine Health and Safety Office, has developed a web-based safety-training program. The first four courses of the web-based Environmental Health and Safety Program are now available to the University community for use at <http://safetytrain.stanford.edu>.

This Web-training program replaces some existing classroom courses with documented on-line safety training that can be completed by individuals at a workstation during times that fit their schedule. This new approach to safety and compliance is anticipated to be more instructive for the individual, as well as to save the University significant personnel resource time. Employees and students receive training appropriate to their specific work environment. Documentation for management and compliance purposes is automatically provided to the individual and supervisor, as well as being maintained in a central University database.

Individuals who have not previously received required safety training should take advantage of this new training opportunity. Anyone having questions regarding the safety training program and requirements should contact Susie Claxton (Claxton@stanford.edu) of EH&S at 723-0448.

Honors and Awards

- **Dr. Larry Steinman** has been named the winner of the John Dystal Prize for his groundbreaking research on multiple sclerosis. The award will take place at the American Academy of Neurology meetings in San Francisco
- **Dr. Bill Newsome** has been named the winner of the Dan David Foundation Prize for his research that has helped to revolutionaries the field of neurobiology. This prize will be shared with Robert H. Wurtz, senior investigator of the Laboratory of Sensorimotor Research, NIH and Amiram Grinvald, director of The Grudetsky Centre for Research of Higher Brain Functions at the Weizmann Institute of Science in Israel.

Please join me in congratulating Drs. Steinman and Newsome for the outstanding accomplishments.

Events

- **Community Lecture Series:** *On Tuesday, March 2nd, Daria Mochly Rosen, Ph.D., Chair, Department Molecular Pharmacology, will present "Can Basic Research of Heart Attacks Lead to Drug Development in Academia?" at the next monthly lecture in this very successful series. Dr. Mochley Rosen will discuss the general belief that the resources and tenor of academia are not*

conducive to applicable research. However, academic research often yields key discoveries that can affect clinical care. The freedom to explore ideas, the outstanding researchers available for discussions and collaborations, and the institution that encourages the pursuit of research allows the translation of laboratory discoveries into drug development. Please join us in the Clark Center Auditorium at 7:00 p.m. for this lecture. If you have any questions, please call 650-234-0647.

Dean's Newsletter

March 8, 2004

Joint Clinical Program Planning by the School of Medicine and Stanford Hospital & Clinics

During the past several months, faculty and leaders in the School of Medicine (SoM) and at Stanford Hospital & Clinics (SHC) have been working together to establish strategic plans for clinical program development. On the broadest scale this has engaged discussions about the overall focus of adult clinical programs; the balance between primary, secondary and tertiary/quaternary care; the relative proportion between in-patient and ambulatory services; the location of clinical programs on the Medical Center campus or at off-site locations; and, in each sector, improving the quality of care and patient services. Embedded in these discussions is a deeper definition of the clinical mission of SoM and SHC and how this is likely to change in the years ahead.

It seems clear that emerging technologies that focus on minimally invasive diagnostic and therapeutic procedures will have an impact on where patients are treated and who will provide the care. Coupled with this are the aging population and its impact on the prevalence of various disorders along with the increasing chronicity of many diseases as treatments or interventions become more established and successful – even if not always curable.

Among the most important questions to be addressed is what will make Stanford Medical Center unique and how will it be differentiated from other local, regional and national clinical programs (and competitors). This is particularly germane in the Bay Area where large medical systems (including Kaiser and Sutter) dominate the health care market and, in many ways, seek to control the flow of patients to their own institutions. Locally, the Palo Alto Medical Foundation, which has had a long association with Stanford, is planning to expand its physician network, open one or more regional hospitals, and, with its corporate partner Sutter, have a dominant role in the same regional catchment areas as Stanford. Thus, in some not insignificant ways, PAMF, by the choices they have made, also emerges as a regional competitor – which, at least in my opinion, is not the best way to serve our local community.

Setting a new standard for Stanford Medical Center requires that we provide state-of-the-art clinical care along with outstanding patient services, and that we further differentiate Stanford by providing diagnostic and treatment programs not available elsewhere. One of

our greatest strengths is the exceptional research programs that exist at Stanford and, equally importantly, their potential for bringing discoveries from the laboratory to the clinic. Indeed, Translating Discoveries is the overarching theme that will define the School of Medicine and Medical Center in the first decades of the 21st Century. Our goals and objectives in this important area are delineated in our School's Strategic Plan (see <http://medstrategicplan.stanford.edu>).

During the past 2-3 years, we have delineated several key areas for investment that are now embraced within the evolving Stanford Institutes of Medicine – which are designed to bring together basic and clinical science faculty in several important thematic areas where we have both the expertise and opportunity to truly make a difference in improving human health. Presently, four Institutes of Medicine are being developed, each having the opportunity to engage faculty from other Schools within the University (e.g., Engineering, Humanities & Sciences) to further develop unique opportunities for the future.

To make these programs meaningful to the Stanford Medical Center, we have worked diligently to align the Institutes of Medicine to the important clinical initiatives at both SHC and the Lucile Packard Children's Hospital (LPCH). These connections provide the opportunity to create a continuum between research to patient care. They also provide special opportunities for educating our students, residents and postdoctoral scholars. The connecting points can be illustrated as follows:

SoM: Stanford Institutes of Medicine	SHC: Clinical Centers of Excellence – Service Lines	LPCH: Clinical Centers of Excellence – Service Lines
Cancer/Stem Cell Biology	Cancer	Cancer
Neurosciences	Neurosciences	Brain/Behavior
Cardiovascular Medicine	Cardiac	Heart
Immunity, Transplantation, Infection	Transplantation	Transplantation

The selection of these areas is not meant to preclude other important clinical disciplines. However, it is meant to identify those areas where we believe important opportunities exist and where Stanford can excel. Based on that, SoM and SHC have developed detailed inventories of key strategic initiatives within each of these four areas, focus that on the resources needed to make these programs successful (a separate planning process has been engaged for LPCH). These inventories include projections of clinical volume growth in each strategic area along with the incremental physician and professional staff that will be needed to achieve the projections. Also included are the capital requirements –for both facilities and equipment – as well the potential opportunities for technical advancement – including new innovations and opportunities for translational research.

The first phase of this integrated planning effort was presented to the SHC Board of Directors at a full day retreat on March 5th. Faculty leaders as well as SHC senior staff presented key elements of the plan as follows:

1. ***Neuroscience Strategic Plan*** was presented by Dr. Bill Mobley, Director of the Neurosciences Institute at Stanford and Professor of Neurology and Neurological Sciences, and Gary Steinberg, Professor and Chair of the Department of Neurosurgery.
2. ***Cardiovascular Strategic Plan*** was presented by Drs. Bobby Robbins and Alan Yeung, Co-Directors of the Clinical Cardiac Programs at SHC and Associate Professor of Cardiothoracic Surgery and Associate Professor of Medicine respectively.
3. ***Transplantation Strategic Plan*** was presented by Dr. Carlos Esquivel, Professor of Surgery, and Dr. Emmet Keeffe, Professor of Medicine.
4. ***Cancer Strategic Plan*** was presented by Dr. Richard Hoppe, Professor and Chair of the Department of Radiation Oncology and Chair of the Clinical Cancer Steering Committee. I am happy to note that Dr. Steve Leibel, who will be joining Stanford in July to become the first Ann and John Doerr Medical Director of the Clinical Cancer Program was also present for the discussion (see below for the announcement of Dr. Leibel's appointment).

In each strategic plan, program development in various subcategories was enunciated – casting a wide net for potential clinical development and translational research. In a sense, this phase of the planning exercise has defined a much broader landscape than is currently feasible. During the next several months, the strategic planning process will be further refined by prioritizing, within each major Institute/Center, the specific areas for further development, the likely return on investment and the resources needed to achieve a successful outcome. Clearly priorities will be needed in each of these four areas. Equally importantly, as this process unfolds, a further integration and refinement of the planning process will need to choose among and between the opportunities offered by each of the strategic plans so that an overall determination of resource investment can be determined. Also, in each case, priorities will be set regarding opportunities both for academic development as well as for financial value. The timeline for making these investments will also be determined during this process.

The process to date – and that for the future – will require close collaboration between the School and the Hospital. Because of the broad mission of the Stanford Medical Center, some of the final choices will be determined by the opportunities that specific programs offer for academic development, translational research and/or financial return. Accordingly, these decisions need to take into account both the academic as well as business-related needs of Stanford Medicine and the Medical Center.

Clearly, time is of the essence. It is essential that this process be fully completed within the next 3-4 months so that program development can be optimized. Naturally I will report back to you on the progress we are able to make in this important planning process.

Science and Politics

A couple of weeks ago, I had the opportunity to participate in one of the Practice of Medicine classes for our first year medical students. Together with Ryan Adesnik, Director of Government Relations, and Paul Costello, Executive Director of Communications and Public Affairs, we discussed a wide array of topics – including some of the ever-increasing concerns about science and politics. More specifically, those concerns have included the increasingly ideological approach to science being taken by the current federal administration. This not only involves positions on topics like stem cell research but also includes the appointment of individuals to advisory committees based on whether the individual supports certain policies – based not just on science but seemingly also religion and “ethics.” Just two weeks ago a group of leading scientists, including many Nobel laureates, expressed their concern about this current approach to science and politics in an open letter to the New York Times. Amazingly, just a week later, the administration announced that it was replacing members of the President’s Bioethics Council – in practice eliminating those who had dissenting views with new members who seemed to bring more conformance. This is, of course, shocking in its own right, and raises many concerns about an increasing blurring of science, politics, ideology and religion. Regardless of our beliefs – or even belief systems – this is something we should all be concerned about.

In the Sunday, March 7th Washington Post, an Op Ed piece was presented by Dr. Liz Blackburn, who was recently informed that she would no longer be a member of the President’s Bioethics Council. I am taking the liberty of sharing her Op Ed piece as it appeared in the Washington Post since it summarizes quite clearly why these current trends should alarm and concern all of us.

A 'Full Range' of Bioethical Views Just Got Narrower

By Elizabeth H. Blackburn

washingtonpost.com

Sunday, March 7, 2004; Page B02

The phone rang a few days after Sept. 11, 2001. It was Leon Kass, chairman of the brand-new President's Council on Bioethics, calling to ask: Would I join this White House-appointed federal commission charged with advising the president on ethical issues arising from advances in biomedical science and technology?

As a cell biologist who had spent years investigating causes of cancer and human aging, I had already begun thinking about the ramifications of such research. Like many people at that tumultuous time, I also felt eager to do something -- anything -- to serve a cause larger than myself. I understood that the council would include not just biomedical scientists but medical doctors, philosophers and legal and policy experts, and Kass assured me it would consider diverse views and avoid foregone conclusions. I agreed then and there to serve. Little did I guess that a scant two and half years later a White House phone call would notify me that my services were no longer needed.

In the weeks it took to finalize the appointment, I reflected on my decision. I knew that council discussions were likely to present challenges; for years Kass, a professor of social thought, had expressed views I believed to be unfriendly to many aspects of biomedical research and contemporary medicine. But I felt that as a seasoned scientist whose own work touched on these areas, I could help the council distinguish between real, experimentally validated science and what amounted to sheer flimflam on issues muddled by competing voices and agendas, and little data.

In January 2002, the entire 18-member council met with President Bush at the White House. His initial directive was for us to report on the ethics of therapeutic cloning (also known as somatic cell nuclear transfer) and reproductive cloning. Therapeutic cloning involves making early-stage pre-implantation embryos for use as sources of stem cells -- for research and to be used in cures -- while reproductive cloning refers to the creation of cloned babies by transferring cloned embryos to a womb for gestation and birth. I was encouraged when Bush stressed that he wanted to hear the full range of views on those and other questions.

When I read the council's first discussion documents, my heart sank. The language was not what I was used to seeing in scientific discourse -- it seemed to me to present prejudged views and to use rhetoric to make points. Still, the debates we had in the ensuing months proved far-ranging, and all comments were politely received. And, despite the betting of outsiders, 10 of the council's 17 members (one had retired) initially voted against recommending a ban on therapeutic cloning. A late change to the question being voted on turned the minority who were in favor of a ban into a majority of 10 favoring a four-year moratorium, an option the council had not discussed in meetings. But the report issued in July 2002 contained a breadth of views. It also contained a series of personal statements by council members, many of them dissenting from the report's official recommendations.

In the year and a half following that report, I began to sense much less tolerance from the chairman for dissenting views. I will focus only on embryonic stem cell research.

Work with animal models had been indicating the potential benefits of such research for more than two decades. More recently, breakthrough research had suggested for the first time that those avenues of investigation would be possible in humans, with revolutionary implications for health care. Yet at council meetings, I consistently sensed resistance to presenting human embryonic stem cell research in a way that would acknowledge the scientific, experimentally verified realities. The capabilities of embryonic versus adult stem cells, and their relative promise for medicine, were obfuscated. Although I was not able to attend every meeting, I engaged fully in preparations for the report: I read and assessed the published science, attended presentations on new research at national and international scientific conferences, and consulted with cell biologists, including stem cell biologists, across the country. The information I submitted was not reflected in the report drafts.

Clearly, the council's reports concerned politically charged topics. I knew that my views on cloning and stem cell research did not match those of either Kass or Bush, as I understood them: In his public statements, the president had supported banning therapeutic as well as reproductive cloning. Still, I was not prepared for the phone call I received at home from the White House on Wednesday, Feb. 25. The caller requested that on Friday afternoon I call the White House Personnel Office. No hint was given as to the reason. When I called, the director said that the White House had decided to "make changes" in the council and that it was adding new people to replace some individual members. I asked him whether this meant that my term on the council had terminated, and the reply was yes.

And what "changes" they were. I was one of just three full-time biomedical scientists on the council. William May, a deeply thoughtful, erudite theologian and medical ethicist, was also leaving. He, too, had often differed with Kass on issues such as the moral worth of biomedical research and the ramifications of trying to legislate such research. And he, too, had voted against both a ban and a moratorium on therapeutic cloning.

When I read the published views of the three new members (bringing the council up to its original total of 18 members), it seemed to me they represented a loss of balance in the council, both professionally and philosophically. None was a biomedical scientist, and the views of all three were much closer to the views espoused by Kass than mine or May's were. One, a surgeon who was not a scientist, had championed a larger place for religious values in public life. Another was a political philosopher who had publicly praised Kass's work; the third, a political scientist, had described research in which embryos are destroyed as "evil."

Why do I find the concept of banning embryonic stem cell research so troubling? Leon Kass has suggested that society should make decisions based on what he calls the "wisdom of repugnance." I think this is an unreliable kind of wisdom. Repugnance should serve not as a basis for any decision, but rather as a signal for honest, critical examination of what inspired it. In some instances, repugnance may indeed hint at moral qualms that will withstand the rigors of analytical questioning. But it may also simply reflect habit or custom.

I am convinced that enlightened societies can only make good policy when that policy is based on the broadest possible information and on reasoned, open discussion. Narrowness of views on a federal commission is not conducive to the nation getting the best possible advice. My experience with the debate on embryonic stem cell research, however, suggests to me that a hardening and narrowing of views is exactly what is happening on the President's Council on Bioethics.

On Super Tuesday, four days after the White House call, I stopped by the garage at a local house that served as my neighborhood's polling station. In the soft, early-evening light, it felt far removed from the brightly lit pomp and splendor of the White House I had

visited two years earlier as a member of the Bioethics Council. Here in this garage, men and women also were volunteering their efforts, contributing to the civic good. They beamed and congratulated me when I mentioned that I, a native-born Australian, had recently become a U.S. citizen. A surge of appreciation swept through me as they went about their tasks, watchfully protecting due process. In this down-home setting, that charge suddenly felt so precious, and so fragile.

I am convinced that enlightened societies can only make good policy when that policy is based on the broadest possible information and on reasoned, open discussion.

Narrowness of views on a federal commission is not conducive to the nation getting the best possible advice. My experience with the debate on embryonic stem cell research, however, suggests to me that a hardening and narrowing of views is exactly what is happening on the President's Council on Bioethics.

NIH Roadmap and Other Initiatives

Recently the NIH has announced a major new granting initiative to promote nondisciplinary research. This program <http://nihroadmap.nih.gov/grants/index.asp> is likely to grow over the coming years. Other agencies are also placing new or renewed emphasis on the importance of large, multi-component research efforts. In order to facilitate Stanford faculty's ability to respond to these opportunities in a timely and efficient fashion we have initiated several support efforts.

First, an email based notification announcing the new opportunities will be distributed to all faculty on a weekly basis. Second, the School of Medicine is about to launch a web based interactive message board where faculty with interests in these various grant opportunities can identify one another and organize responses as they see fit. This message board will be available to all Stanford faculty. Finally, the School of Medicine has recently hired an administrator whose job will be to help organize and assemble large multi-faculty, multi departmental grant applications. This person could be available to assist on grant applications involving collaborations between SOM faculty and faculty in

other schools.

We hope these interventions are useful and serve to promote and facilitate more interactive science.

Appointment of the Director of the Stanford Institute for Cardiovascular Medicine

I am extremely pleased to announce that Dr. Robert C Robbins, Associate Professor, Department of Cardiothoracic Surgery, has agreed to become the Director of the Stanford Institute for Cardiovascular Medicine. Dr. Robbins was recommended for this position, with great enthusiasm, by colleagues and leaders in cardiovascular medicine and research at Stanford.

As you know, over the past year we have established four Stanford Institutes of Medicine – three of which now have Directors. These are the Institute for Cancer/Stem Cell Biology and Medicine directed by Dr. Irv Weissman, the Neurosciences Institute at Sanford directed by Dr. Bill Mobley and now the Cardiovascular Institute that will be directed by Dr. Bobby Robbins. Over the next couple of months I hope to also name the director of the Institute for Immunity, Transplantation and Infectious Diseases. Together these four Institutes comprise our broad focus on *Translating Discoveries* and offer a linkage between our basic and clinical science faculty along with connections to clinical programs at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital.

A skilled cardiac surgeon, with expertise in heart transplantation as well as complex cardiac diseases, Dr. Robbins is also an NIH-funded investigator whose research is focused on heart transplantation (both in humans and preclinical models) and repair of heart injury using gene therapy or stem cells. He is also an outstanding and articulate leader and is working closely with his superb colleague, Dr. Alan Yeung, Professor of Medicine and Chief of the Division of Cardiology, each serving as Co-Directors of the Stanford Cardiac Center.

I also want to thank Dr. Judy Swain and the Executive Committee for the Cardiovascular Institute for all the excellent work they did during the past many months in helping to craft the fundamental components of the Cardiovascular Institute.

I look forward to working with Dr. Robbins and the members of the CV community to help Stanford achieve even greater distinction in this important area of medicine and science.

Appointment of Medical Director for the Clinical Cancer Center

I am very pleased to announce that Dr. Steve Leibel, currently the Chair of the Department of Radiation Oncology at Memorial Sloan Kettering Cancer Center (MSKCC), will join Stanford this July as the first Ann and John Doerr Medical Director of the Clinical Cancer Center.

Dr. Leibel, who was selected following a national search, is internationally recognized for his research and clinical care expertise. Dr. Leibel received his M.D. degree from UCSF where he also trained in Radiation Oncology. He has served on the faculty of the Johns Hopkins School of Medicine and UCSF and has been at MSKCC since 1988, where he is currently a Member. He has held numerous distinguished leadership positions, including President of the American Society for Therapeutic Radiology and Oncology; Board of Chancellors of the American College of Radiology; and Vice President of the American Board of Radiology. He has won the Teacher of the Year Award from the Association for Residents in Radiation Oncology and the Gold Medal Award from the American Society for Therapeutic Radiology and Oncology. His areas of research interest include the use of 3D Conformational Radiation Therapy along with a specific interest in prostate and brain cancer. Dr. Leibel is the author or co-author of over 150 original scientific publications, 75 reviews articles or book chapters and 5 books. He brings a strong record of knowledge and accomplishment in clinical research.

I also want to take the opportunity to thank Ann and John Doerr for their wonderful gift to the Stanford Medical Center that creates the first Medical Directorship. It is wonderful that Dr. Leibel will be the first incumbent of the Ann and John Doerr Medical Directorship.

I should also add that in addition to recruiting Dr. Leibel, we are also searching for a leading scientist who will become the Principal Investigator for our upcoming grant submission to the NIH that will (we hope) enable us to become an National Cancer Institute-designated Comprehensive Cancer Center. Our efforts in this important arena, currently being lead by Dr. Karl Blume, will complement the clinical programmatic planning noted above and, in the aggregate, enable Stanford to emerge as an exceptional leader in cancer care, research and education.

Appointment of the Chair of the Department of Orthopedic Surgery

Although the search process has been a long one, I am very pleased to announce that we have successfully recruited a new Chair for the Department of Orthopedic Surgery. Dr. William Maloney will officially join Stanford in mid-July.

Dr. Maloney was an undergraduate at Stanford, received his MD degree from Columbia University and then returned to Stanford for his residency in orthopedic surgery. He then did a fellowship in hip reconstructive surgery at the Massachusetts General Hospital and then returned to Stanford and the Palo Alto Medical Foundation before leaving for St. Louis in 1996. He is currently The Charles and Joanne Knight Professor of Orthopedic Surgery and Chief-of-Service and Head of Joint Replacement Surgery at Washington University and the Barnes-Jewish Hospitals. Although he was originally identified by the search committee as its leading candidate nearly two years ago (!), a number of both professional and personal issues impeded his recruitment at that time. Thankfully, in the intervening period, we have been able to successfully resolve these issues and I am extraordinarily pleased that Dr. Maloney – who was our first choice at the outset of this

process – has now been our successful selection as chair-select at the conclusion of the search. We will welcome him with great enthusiasm as he arrives this summer.

Interview Weekend for the Biosciences

Beginning March 4th through the weekend, some 267 prospective bioscience graduate students arrived on campus to complete their interviews with faculty in the School of Medicine, Humanities and Sciences and our new Department of Bioengineering. This group of students has already passed the hurdle of having an application strong enough to warrant in-person interview as well as the opportunity to learn more about the graduate programs in the biosciences.

It was an intense but exciting experience for all - including a dinner event on March 4th featuring research posters by our faculty and students that fostered dialogue and demonstrated the extraordinary breadth of research opportunities at Stanford. March 5th was for interviews – providing both prospective students and faculty the opportunity to define mutual interests and help discern whether Stanford is the optimal environment for future career development. There was also a brunch on Saturday morning to share Stanford's commitment to enhancing diversity and to supporting students through their education and research experiences. I am confident that by the end of the weekend, prospective students had a much deeper appreciation of the outstanding opportunities available at Stanford. Next comes the difficult decision by faculty and departments about which students to offer acceptances to – all of which will happen within the next week. The word on the street was that the overall quality of the prospective applicants is outstanding – which is certainly excellent news for further enhancing the overall success of Stanford.

The Respectful Workplace

As you know, assuring that we have a “respectful workplace” is one of our highest priorities. During our faculty briefings on the Respectful Workplace over the past year, we have been asked about retaliation as well as about what happens to those who falsely accuse others of wrongdoing. I felt it was important to address those questions with you.

Retaliation against an individual who in good faith reports or provides information in an investigation about behavior that may violate University policy related to sexual harassment, discrimination, health and safety and whistleblower protected activities is against Stanford University policy and is against the law; it will not be tolerated. At the same time, the University does not tolerate false accusations that are not brought forward in good faith. Intentionally making false reports or providing false information is grounds for discipline. These types of cases -- which fortunately are few in number -- are managed on a case-by-case basis within the parameters allowed by Stanford University policy and the law.

In case you have wondered about these important issues, I hope that this helps provide some background information.

Affirmative Action Recruitment for Staff Members in the School of Medicine.

In prior communications I have highlighted the importance of having a diverse workplace and have shared our efforts in enhancing diversity among our students, trainees and faculty. While we have made some progress, we still have lots to do to make our school truly diverse.

In addition to our efforts with faculty and students, we are also very committed to enhancing diversity among the staff of the Medical School. In a memo sent to all department administrators last month, the University and School of Medicine have staff affirmative action hiring goals for 2004. Job groups identified as key foci for hiring minorities and women. These include many administrative management positions: DFAs; financial, technical and university managers; administrative services administrators; public relations officers; and administrative deans, among others. Along with Mike Hindery, Senior Associate Dean for Finance and Administration, we want to take this opportunity to reaffirm to the School of Medicine community that our commitment to attaining and maintaining a diverse workforce is strong and continuing.

We encourage all members of the School of Medicine community to support our shared efforts in this regard by helping us to identify and recruit qualified individuals who would bring diversity to our workforce. We also welcome ideas or suggestions for broadening our outreach efforts. Please contact your compensation specialist or Lois Benzel (lbenzel@stanford.edu) in the Human Resource Group with your ideas.

Updates from the Executive Committee: A Report on Supporting Clinical and Translational Research

At the Executive Committee meeting on Friday February 20th, we heard a very helpful presentation from Dr. Steven Alexander, Professor of Pediatrics, and the Translational Research Task Force. This group has representation from Stanford University as well as the School of Medicine, Stanford Hospital and Clinics, and the Lucile Packard Children's Hospital. The members of the Task Force, in addition to Dr. Alexander, are: Dr. Brandy Sikic, Connie Hartnett, Steve Jung, Dr. Harry Greenberg, Rodney Johnson, Pamela Webb, Nick Gaich, Carole Klove, Nancy Lee, Dale Jung, David Haray, and Gary May.

I should note that the impetus behind the formation of the Task Force was:

- To establish a management structure to ensure the efficient processing of clinical and translational research proposals, ethical conduct of research and efficient translation of emerging treatments to clinical use at Stanford, and,
- To pursue the development of the research facilities and infrastructure required to support the effective collaboration of bioscientists and clinical scholars.

Early on in the work of the Task Force, a Clinical Trial Risk Assessment found several aspects of clinical trials work at Stanford that needed remediation, including the budget

process; procedures of invoicing, tracking and collections; and communication and coordination between the School of Medicine and the hospitals. The Task Force has made significant progress in establishing procedures for improving performance in all of these areas.

Additionally, the Task Force has established protocols to take advantage of allowable Medicare reimbursements for certain items and services used in qualifying clinical trials. These include a decision making protocol to determine whether a clinical trial qualifies for Medicare Reimbursement for Routine Costs and a decision making protocol to determine routine costs of a qualifying clinical trial.

Finally, the Task Force has developed a Principal Investigator (PI) Checklist and a Clinical Trial Pre-Award Process for assuring that all aspects of the trial have been thoroughly understood and planned for. These include scientific issues, the safety of study subjects, conflict of interest, financial and other resource issues, the separation of routine case from experimental care, and ethical issues. Going forward, all PI's will complete the PI Check-list and the Clinical Trial Pre-Award Process. The new procedures are currently being piloted with a selected group of faculty. Full implementation is expected in two to four months.

The Task Force has accomplished an enormous amount since its inception. It is continuing to work on additional improvements in such areas as a hospital billing policy and procedure model and an integrated training and education program. All of these improvements will enhance our ability to carry out clinical trials, which are crucial to our success in translational medicine.

Announcement: The Katherine D. McCormick Lecture

The 28th Katherine D. McCormick Lecture will be given March 30, 2004, 12:00-1:00 in the Fairchild Auditorium. This year's Lecture is being cosponsored by the Cancer Biology Seminar Series and will be given by Carol Prives, Ph.D.

Dr. Prives is the DaCosta Professor of Biology and the Chair of the Department of Biological Sciences at Columbia University. She is the recipient of an NIH Merit award and in 1998 was awarded an American Cancer Society Research Professorship. In 2000 she was elected to the American Academy of Arts and Sciences. She is internationally recognized for her work on the p53 tumor suppressor gene. Her Lecture is entitled, *"Regulation of the p53-Mdm2 circuit: a major checkpoint in mammalian cells."* All are welcome.

Honors and Awards

I am very pleased to let you know that **Dr. Matt Bogyo**, a still new Assistant Professor in the Department of Pathology, has been appointed as a 2004 Searle Scholar. Congratulations to Matt.

Appointments and Promotions

- **Judith Ford** has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 3/1/2004 to 2/28/2010.
- **Edward Graves** has been appointed to Assistant Professor of Radiation Oncology (Radiation Physics), effective 3/1/2004 to 2/28/2007.
- **M. Peter Marinkovich** has been promoted to Associate Professor of Dermatology, effective 3/1/2004.
- **William Weis** has been promoted to Professor of Structural Biology and, by courtesy, of Molecular and Cellular Physiology, effective 3/1/2004.

Dean's Newsletter March 22 2004

Match Day 2004

Thursday, March 18th was Intern Match Day 2004. Although the National Match has been cast in some controversy during the past couple of years because of the Jung et al lawsuit, this event still represents a high point in the career planning for graduating medical students. As in past years, medical students across the country found out at the same time (obviously corrected for time-zones) where they will spend their Internship Year beginning this June/July. That moment was 10:00 a.m. PST on March 18th. As you might imagine, just prior to the traditional passing out of the envelopes containing the announcement of where the student “matched” there were a lot of butterflies and anxiety. But that soon transitioned to squeals of joy as the students received their match.

The Match has a long history, having been created more than 50 years ago at the urging of medical students to help organize what had been a chaotic and sometimes unfair process. Coordinated by the National Resident Matching Program, the Match today is a fair and efficient process for both students and institutions. Nationally, 85% of US medical students are accepted by one of their top three choices and more than 60% by their first choice. These percentages are higher at Stanford – with generally well over 90% matching at one of their top three choices.

The results for this year's Match for Stanford medical students can be found here: **2004 Residency Match Results** (will appear in a new browser window). Of the 81 students who were in this year's match, 44% of the students will go on to three programs: 20 will be spending their PGY1 year at Stanford, 9 at Harvard teaching hospitals, 7 at UCSF. In addition, other excellent programs were included in the remainder of our students match results. This year the specialty choices attracting the greatest number of students were: Internal Medicine (12 students), General Surgery and Surgical Specialties (11 students), Family Medicine (9 students), Psychiatry (8 students), Anesthesia (7 students),

Dermatology (6 students) and Emergency Medicine, Radiation Oncology and Radiology (each with 5 students)

Equally impressive are the Match results for students who will be joining our clinical departments at Stanford Hospital & Clinics and the Lucile Packard Children's Hospital from medical schools across the nation.

Thanks to the Stanford Medical Alumni Association, we had the pleasure of having a wonderful celebratory dinner (following what I am confident was a very joyous day) with our medical students along with their families and friends.

Congratulations to all.

Paul Michael Glaser (the original Starsky) Will be This Year's Commencement Speaker With Match results now available, the next big event is Commencement – which will be on Saturday June 12th!

The recent release of the movie “Starsky and Hutch” has rekindled interest in a once well-known TV series by the same name. In the original version, Starsky was played by Paul Michael Glaser – whom we have invited to be the School of Medicine Commencement Speaker on Saturday, June 12th. But this is not the reason that Paul Glaser will address our graduating students and their families. He has a more important message to convey.

In real life, Paul Glaser has experienced quite personally the impact of illness on his family. His wife, Elizabeth, was infected with HIV when she was transfused in the early 1980's for hemorrhaging related to a placenta previa during the birth of their first child, Ariel. This was prior to the time when HIV had been identified as the cause of AIDS and before the blood supply was screened and safe. Their daughter, Ariel, contracted HIV from Elizabeth due to breast-feeding and within several years had rapidly advancing AIDS, from which she died at the age of seven. A second child, Jake, was also infected due to maternal/child transmission before it was recognized that Elizabeth and Ariel were infected with HIV. Thanks to biomedical research, Jake is still living with HIV nineteen years after his birth.

With the knowledge that both her children were infected with HIV, Elizabeth Glaser, Paul's wife, became one of the most effective advocates for research and clinical care this country has ever known. She founded a non-profit organization now named in her honor (the Elizabeth Glaser Pediatric AIDS Foundation), which literally changed the landscape of pediatric research first in the US and now around the world. Although Elizabeth died of AIDS in December 1994, the work she began has continued to grow in its impact and importance. Paul Glaser has played an instrumental role in championing the work of the Foundation and has been an eloquent spokesperson for the importance of research as well as humanism and care for those afflicted with serious disease. He will share his very unique personal story and perspective at this year's Commencement Ceremony.

Children of Uganda Performance at Stanford Lively Arts Reminds Us of the Global Tragedy of AIDS

Thanks to the widespread availability of prenatal testing and utilization of antiretroviral agents to block maternal/child transmission, the number of children in the USA who become infected with HIV has fallen dramatically during the past decade. Despite these remarkable advances, more than 2000 children are infected with HIV around the world, virtually all of them in developing countries, particularly Africa and Asia. Of the 42 million people infected with HIV worldwide, 3.2 million are children. Moreover, 50% of the global infections with HIV occur among young people between 15-24 years of age – at the rate of nearly 6000 every day, most being young women. The impact of this global infection, now the leading cause of death in developing nations, is devastating.

On Friday evening, March 19th, the Stanford Lively Arts featured a unique performance by the Children of Uganda. Each of the children and teenagers who performed has been orphaned because of the death of their parents to either AIDS or national violence. With the onset of HIV/AIDS, the life expectancy in Uganda has fallen to 42 years. In some parts of Africa the prevalence of AIDS has grown dramatically with most infected women not being aware that the disease can be transmitted to her child – through breast feeding or during gestation and delivery. Uganda has been a recent pacesetter in Africa with the government taking an active role in education and intervention. The so-called ABC (Abstinence/Be Faithful/Use Condoms) program has contributed to a reduction in HIV prevalence in Uganda to 6.2% at the end of 2002 from over 30% in 1986. This program demonstrates that active intervention can make a difference.

The Elizabeth Glaser Pediatric AIDS Foundation (see above) is working closely with the Ministry of Health and other partners in Uganda to further prevent mother-to-child transmission as well as to provide counseling, testing and drugs for opportunistic infections as well as antiretroviral agents. Importantly the Foundation is supporting prevention and treatment programs in 19 of the 56 health districts in Uganda. The Foundation's Call To Action Project is collaborating with physicians and countries in 17 countries throughout Africa, Southeast Asia, Eastern Europe, Central America and the Caribbean. As a consequence of these efforts, over 900,000 women have received antenatal care worldwide and of these nearly 690,000 have had voluntary HIV testing. Such efforts can help to change the impact of this disease around the world – although the challenges remain daunting.

In addition to its work in AIDS, the Foundation also supports the Glaser Pediatric Research Network, which has linked five major pediatric centers in the USA (one being Stanford) to work collaboratively by conducting clinical research in children. Dr. Charles Prober, Professor of Pediatrics, currently serves as the Scientific Director of the Glaser Pediatric Research Network. I have had the privilege of working with the Elizabeth Glaser Pediatric AIDS Foundation since it was founded in 1988 and currently serve as the Vice Chair of its Board of Directors.

External Review of Plans for Our Comprehensive Cancer Center

On Friday March 19th, the External Advisory Board (EAB) appointed to review the progress on our planned application to the National Cancer Institute to become an NCI designated Comprehensive Cancer Center visited Stanford. This distinguished Advisory Board includes Martin D. Abeloff, M.D., Director, Sidney Kimmel Comprehensive Cancer Center at Johns Hopkins University; Edward Benz, M.D., President, Dana Farber Cancer Institute; Elizabeth Blackburn, Ph.D., Professor, Department of Biochemistry & Biophysics, UCSF; John H. Glick, M.D., Director, Abramson Cancer Center of the University of Pennsylvania; Edward E. Harlow, Ph.D., Head of the Department of Biological Chemistry, Harvard Medical School; John E. Niederhuber, M.D., Comprehensive Cancer Center, University of Wisconsin; Joyce C. Niland, Ph.D., Chair, Division of Information Sciences, Director, Department of Biostatistics, City of Hope National Medical Center; Louise Strong, M.D., Department of Experimental Pediatrics/Genetics, University of Texas, MD Anderson Cancer Center; and Marcy Waldinger, M.H.S.A., Director of Administration, UMC Cancer Center. Drs. Hartwell, Niederhuber and Strong were unable to make the March 19th meeting.

During an eight-hour marathon session, the EAB heard presentations about the five basic science proposals, seven clinical/translational research projects, the population science study, and 13 cores (shared services). The goal of this review is to obtain critical feedback on the current proposals and to help guide which ones will be part of the grant that we hope to submit in October 2004. The preliminary feedback we received from the External Advisory Board was quite gratifying. Although they quite appropriately identified areas where we need to bring greater clarity to proposals, consolidate others and even drop some, the EAB was quite impressed with our progress to date. Indeed, several members commented that they were skeptical about whether Stanford would have the resolve to truly engage the faculty and school leaders to apply for the NCI designation. Thankfully, the EAB was enormously impressed by the energy, enthusiasm and commitment they observed during their visit – and left quite convinced that things had changed at Stanford and that we would indeed not only submit the grant application – but that we would be successful.

I attribute a significant reason for our success to date in the support that has come from faculty and school leaders. Equally importantly, Dr. Karl Blume, Associate Director of the Cancer/Stem Cell Biology and Medicine Institute, has played a critically important role in bringing the faculty together to develop the proposals to date. Thanks to his efforts I have great confidence that we will meet our deadline in submitting this grant to the NCI – an absolutely massive undertaking.

Official Opening of the Clinical Cancer Center

On Monday March 1st, the doors of the new Center for Ambulatory Care at Stanford Hospital & Clinics opened officially to the Clinical Cancer Center. This new advanced care facility will provide state-of-art-care to patients and families (see <http://news-service.stanford.edu/news/medical/2004/march10/leibel.html>). Obviously the diagnosis

and treatment of cancer pose enormous challenges to patients and families – but the new Clinical Cancer Center has gone a long way toward alleviating the fear, anxiety and discomfort associated with cancer care facilities. Indeed this new facility serves as a model for Stanford and for our community.

Mark Your Calendars for the Beckman Symposium on April 30th

On Friday, April 30th, the 14th Annual Beckman Symposium will present a stellar program on cancer. It will be held in the Fairchild Auditorium from 8 am to 5 pm, and will feature multiple breakout sessions throughout the day designed to give students and other symposium attendees the opportunity to interact directly with guest speakers. The first breakout session begins at 7:00 a.m. with the program's first speaker, Brian Druker from Oregon Health & Sciences University. Medical students will be allowed to attend the symposium in lieu of classes that day and I would encourage you to get to as much of this important program as your time permits. A reception will follow in Fairchild lobby.

The program will include presentations by an outstanding faculty including Brian Druker, Patrick Brown, Napoleon Ferrara, Elaine Fuchs, Stanton Glantz, Lee Hartwell, Vicki Lundblad, and Nikola Pavletich.

Neuroscience for the Community

On Monday evening, March 15th, more than 200 members of the community participated in the Stanford Neurosciences Mini Course in Medicine. This is part of a series of lectures and mini-courses that we have held during the past years to better inform and engage our community about important topics in medicine and science and how Stanford is addressing them. This program featured a wonderful keynote address by **Dr. Bill Mobley**, John E. Cahill Family Professor in the School of Medicine and Director of the Neurosciences Institute at Stanford entitled “Keeping the Promise of Neuroscience: Creating a Culture for Discovery and Care.”

As with other mini-courses, small group sessions were lead by members of our remarkable faculty on topics of considerable interest and importance. Included in this program were classes on:

- Brain Function and Decision Making - **Bill Newsome**, Professor of Neurobiology and of Psychology
- Chronic Pain - **David Yeomans**, Associate Professor of Anesthesia, and **Sean Mackey**, Assistant Professor of Anesthesia
- Depression - **Alan Schatzberg**, Kenneth T. Norris, Jr. Professor of Psychiatry and Behavioral Sciences
- Parkinson's Disease and Movement Disorders - **Helen Bronte-Stewart**, Assistant Professor of Neurology and Neurological Sciences and of Neurosurgery
- Sleep Disorders - **Emmanuel Mignot**, Professor of Psychiatry and Behavioral Sciences
- Applied Stem Cell Therapies - **Theo Palmer**, Assistant Professor of Neurosurgery

- Brain Tumors - **Lawrence Recht**, Professor of Neurology, and Griffith Harsh, Professor of Neurosurgery
- The Genetics of Aging - **Stuart Kim**, Professor of Developmental Biology and of Genetics
- Multiple Sclerosis - **Ben Barres**, Professor of Neurobiology and Developmental Biology and of Neurology and Neurological Sciences
- Stroke - **Gary Steinberg**, Professor of Neurosurgery and of Neurology & Neurological Sciences, and **Greg Albers**, Professor of Neurology and Neurological Sciences and of Neurosurgery

I want to thank our faculty for taking the time to participate in this excellent session on “Breakthroughs in Neurological Diseases”. I also want to thank our Office of Medical Development for all the work they did in helping this to be an outstanding experience for our community.

Getting Your Input on the Value of the Dean’s Newsletter

It is amazing to me that this Newsletter represents the final edition of the third year that I have been sending them to you – since my very first communication on the day of my official arrival on April 2, 2001. I have (as you probably all too well realize) sent them faithfully biweekly except during summer. My hope has been to use the media as a way of communicating with the faculty, students and staff of the Medical School, Medical Center – and even members of the University community. Because I compose (and indeed type) the Dean’s Newsletters myself, they represent a real commitment of time and effort on my part. I have been happy to do this if they are fulfilling the intended purpose of enhancing communication and making you feel better informed and engaged in our various activities – past, present and future. In the immediate future we will be sending out a survey that I hope you will complete. It is designed to get feedback on how useful you find the Dean’s Newsletter – and obviously, your responses will guide how (and indeed whether) I continue this communication vehicle in the future. I hope you will spend a few minutes to complete the survey when it arrives next week.

Honors and Awards

- The Lustgarten Foundation for Pancreatic Cancer announced the recipients of its 2004 grants and **Dr. Jonathan Pollack**, Assistant Professor of Pathology, Stanford University School of Medicine, is among the grantees. His proposal to locate the novel pancreatic cancer genes with DNA microarrays was chosen by the Lustgarten Foundation's Scientific Advisory Board, which is comprised of leading experts in pancreatic and other cancers. They reviewed more than 80 proposals and awarded grants to only fifteen researchers. Congratulations to Dr. Pollack.
- **Dr. David Stevenson**, Harold K. Faber Professor of Pediatrics and Senior Associate Dean for Academic Affairs and Professor, by courtesy, of Obstetrics and Gynecology, has received the National Instituted of Child Health and Human

Development's MENTOR Award for Excellence in Research Training. This prestigious award acknowledges the ability of Dr. Stevenson and his colleagues to mentor and guide the research trainees who have entered his program. Please join me in congratulating Dr. Stevenson.

Announcements

Louis and Dorothy Kovitz Visiting Professorship Lecture: On Friday, April 9th, Paul Farmer, M.D., Ph.D., Maude and Lillian Presley Professor of Medical Anthropology, Harvard Medical School, will deliver the 30th Louis and Dorothy Kovitz Visiting Professorship Lectureship. Dr. Farmer's lecture entitled "Global Health Equity and the Future of Public Health" will be held in the Fairchild Auditorium from 4:00pm - 5:00pm (reception at 3:30pm).

The Stanford Division of Cardiovascular Medicine Meeting: "The Evolving Paradigm of Coronary Artery Disease: the pleiotrophic effects of statins" to be held in Fairchild Auditorium, Saturday April 3, 8-12noon. The meeting will feature internationally recognized experts in Cardiovascular Medicine: Peter Libby, Harvard (The Central Role of Vascular Inflammation in CAD); Valentin Fuster, Mt. Sinai (Visualizing and Managing Atherothrombosis), Christie Ballantyne, Baylor (What have we learned from the Statin Trials?); and John Cooke, Stanford (Targeting the Endothelium: An emerging therapeutic approach). For More Information, visit their website at: <http://cvmed.stanford.edu/vascularmedicine/statinconference.html>.

Appointments and Promotions.

- **Nikolas Blevins** has been appointed to Assistant Professor of Otolaryngology at the Stanford University Medical Center, effective 3/1/2004.
- **Judith Ford** has been promoted to Professor (Research) of Psychiatry and Behavioral Sciences, effective 3/1/2004.
- **Geoffrey Lighthall** has been reappointed to Assistant Professor of Anesthesia at the Palo Alto Veterans Affairs Health Care System, effective 8/1/2004.
- **Steven Lindley** has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Palo Alto Veteran's Affairs Health Care System effective 3/1/2004.
- **Krisa Van Meurs** has been promoted to Professor of Pediatrics (Neonatology) at the Lucile Salter Packard Children's Hospital, effective 3/1/2004.
- **William Rhine** has been promoted to Professor of Pediatrics (Neonatology) at the Lucile Salter Packard Children's Hospital, effective 3/1/2004.
- **Paul Wang** has been appointed to Professor of Medicine (Cardiovascular Medicine) at the Stanford University Medical Center, effective 3/1/2004.
- **William Weis** has been promoted to Professor of Structural Biology and of Molecular and Cellular Physiology, effective 3/1/2004.
- **Alan Yeung** has been promoted to Professor of Medicine (Cardiovascular) at the Stanford University Medical Center, effective 3/1/2004.

Dean's Newsletter

April 5, 2004

Your Input on the Dean's Newsletter is Needed

Having past the 3 year mark on April 2nd (both in tenure at Stanford and initiation of the Dean's Newsletter) I am eager to get your input about how useful this biweekly communication is to you and what suggestions you have to change or improve it. Last week I sent out a brief survey questionnaire to which many have already responded. It takes less than 5 minutes to complete and your response will be most useful in helping to guide the future of the Dean's Newsletter. Please fill out the questionnaire at: <http://med-intranet.stanford.edu/survey/newsletter>. We would like to have all responses in hand by April 12th. Thank you for taking the time to fill out the questionnaire.

US News & World Report Misses the Mark Again

A regular rite of spring is the publication each April of the *US News and World Reports* ranking of American's Best Graduate Schools. As was the case last year, Stanford is ranked 8th among "research medical schools." I do not mean to suggest that being among the top 10 research medical schools in the nation is not something to feel proud about. However, I do mean to suggest that the methodology employed by US News & World Reports (USN&WR) is skewed to evaluate size over quality. This has been an issue that I have raised (so far to no avail) with the editors of USN&WR during the past three years. Specifically, the total amount of NIH funding is the single most important determinant in these rankings – which clearly favors schools that have much larger faculty compared to Stanford. Indeed, we are among the very smallest of the research-intensive schools of medicine in faculty size. Our current 732 faculty members number roughly half of those at UCSF and less than 10% of those at Harvard for example. That said, for more than 15 years, our faculty who are Principal Investigators have the highest amount of NIH funding *per capita* compared to any school in the nation – a more accurate surrogate measure of quality compared to quantity. Interestingly, a blend of both total funding and funding per investigator is employed by USN&WR in their ranking of engineering schools. If that were done for Stanford, we would almost certainly be in the top 5 – more accurately reflecting our overall quality.

As noted I have communicated my position each year to the editors of USN&WR and plan to visit with them again at the end of April. The magazine proffers that they perform these rankings in order to provide prospective students with a comparative assessment that helps guide their choice of where to attend. That is an admirable goal – but it should also be one that is accurate. I think students can easily assess the size of an institution, but judging quality is more subtle. In the absence of an impact analysis of the scientific contributions of a school's faculty, a comparative assessment of peer-reviewed NIH funding per principal investigator would be a better gauge of quality than overall amount of NIH funding. I hope, of course, that USN&WR will be more responsive in future years

than has been the case in the past. It does come down to whether the goal is to provide accurate data or simply sell magazines.

Inaugural Visit by the National Advisory Council

On Monday March 22nd we had our first visit by the National Advisory Council (NAC), which was established well over a year ago. The purpose of the NAC is to provide a critical advisory group to the School and University about the status of the School of Medicine, with a particular focus on whether our strategic initiatives and goals are appropriate and commensurate with the very high standards that must be expected from a university such as Stanford. The NAC spends a day each year examining various programs or initiatives and presents their findings to the Provost and President.

We are fortunate to have an outstanding and diverse group of internationally recognized leaders as members of the School of Medicine National Advisory Council. These include:

- **Dr. Ed Benz**, President of the Dana Farber Cancer Center and Professor of Medicine at Harvard Medical School, who also serves as Chair of the NAC
- **Dr. Elizabeth Blackburn**, Professor of Biochemistry and Biophysics at UCSF
- **Dr. Tom Boat**, Physician-in-Chief of the Cincinnati Children's Hospital and Professor and Chair of Pediatrics at the University of Cincinnati
- **Mr. William A Halter**, Trustee Emeritus, Stanford University Board of Trustees
- **Dr. Dan Lowenstein**, Professor of Neurology at UCSF (and formerly Dean for Medical Education at Harvard Medical School).
- **Dr. William Peck**, Dean Emeritus, Washington University
- **Dr. David Satcher**, Director, National Center for Primary Care, Morehouse College School of Medicine, and past U.S. Surgeon General
- **Dr. Carla Shatz**, Professor and Chair, Department of Neurobiology, Harvard Medical School
- **Dr. William Stead**, Professor of Medicine and Biomedical Information and Associate Vice Chancellor for Health Affairs, Vanderbilt Medical Center
- **Dr. Sam Wells, Jr.**, Department of Surgery, Duke University and past President of the American College of Surgeons

Because of schedule conflicts, Drs. Peck and Stead were unable to attend the meeting on March 22nd.

The visit included an overview of the strategic plans and challenges of the School entitled "The Stanford Roadmap to Translating Discoveries," which I delivered. It provided a context for the "state of the school," the initiatives we have pursued, some of the accomplishments we have made and the challenges that we face in the years ahead. This was followed by updates on our goals, initiatives and achievements in "Educating Future Leaders in Medicine and the Biosciences." These were provided by Dr. Julie Parsonnet, Senior Associate Dean for Medical Education; Dr. John Boothroyd, Senior Associate Dean for Research, Graduate Education and Postdoctoral Affairs; and Dr. Harry Greenberg, Senior Associate Dean for Research, Graduate Education, and Postdoctoral

Affairs. The NAC then had the opportunity to have an informal lunch with medical and graduate students that focused on these educational initiatives as well as problems and challenges as seen by the students.

The afternoon session was dedicated to the topic of Enabling Translation and featured presentations on the burgeoning status of three of our new Stanford Institutes of Medicine. These included the Neuroscience Institute at Stanford by Dr. Bill Mobley, Director and Professor and Chair of Neurology and Neurological Sciences; the Stanford Institute for Cardiovascular Medicine by Dr. Bobby Robbins, Director and Associate Professor of Cardiothoracic Surgery; the Stanford Institute for Immunity, Transplantation and Infection by Dr. Ann Arvin, Professor of Pediatrics and of Microbiology and Immunology and Dr. Larry Steinman, Professor of Neurology and Neurological Sciences and of Pediatrics. In addition, Dr. Paul Yock, Professor of Medicine and Bioengineering, presented a status report on the new Department of Bioengineering and the Program in Biodesign.

The presentations were each very informative and afforded the opportunity for the NAC to engage in an enlightened and helpful discussion. While their official report will be made to the Provost and President, it seemed clear that the NAC was extremely impressed with our progress to date and our overall orientation toward Translating Discoveries. They were very pleased with the progress made in curriculum development and our plans for educating students in the biosciences and for seeking to integrate scholarship (and scholarly concentrations) into the training of residents and fellows. They also praised the goals and aspirations of the Stanford Institutes of Medicine and the unique and important role they will play in bringing together faculty from basic and clinical sciences, as well as providing an opportunity to better integrate the school's work with the rest of the university.

The NAC noted that one of the unique aspects of Stanford is the close proximity of the School of Medicine to the rest of the University. They noted that the opportunities emerging in biology, the biosciences and health care provide an important linkage between the medical school and its sister schools across the university. They were particularly pleased by the larger interdisciplinary efforts underway and felt that these would help make Stanford a true leader and pacesetter for the future. Most importantly, they felt that the steps we have taken to date makes us more prepared than most medical schools to seize the opportunities now emerging and to help shape the future in important and significant ways. This is particularly true because of the overall excellence of the various schools at Stanford – including the School of Medicine.

Overall this inaugural visit was quite excellent and it would seem that the members of the NAC are now advocates (as well as critical advisors) for our future. In the years ahead the NAC will spend time drilling down into more specific areas of opportunity and challenge and, I am certain, will be enormously helpful in making sure that we stay true to our goals and objectives for the future.

Addressing Diversity – A Major Challenge for the School of Medicine

Despite the progress that has been made in some areas, one of our major challenges and goals is to further improve the diversity of our School of Medicine community. Thanks to decades of effort, we have among the most diverse medical student classes in the nation. We are making progress in improving the diversity of our graduate student program but face significant challenges in the diversity of our residency programs and in our faculty composition. This matter will be the focus of a number of future initiatives; I anticipate bringing you updates in future issues of the Newsletter.

In the area of graduate student diversity, this past weekend the School of Medicine participated in the University's Graduate Diversity Admit Weekend. We hosted nine students who have been admitted to the Biosciences graduate programs. The weekend included panel discussions, a luncheon with faculty at the home of Dr. Ellen Porzig, and dinner with faculty, the Provost, and the President. Several of the admits commented that the Graduate Diversity Admit Weekend had made a difference for them and was convincing them that Stanford really is a place they could imagine spending five years doing a Ph.D. Thanks to Kimberly Griffin, Assistant Dean for Graduate Education, and Dr. Ellen Porzig, Associate Dean for Graduate Education, for making this event the major success it clearly was for our Biosciences graduate programs admits

We are certainly not alone in trying to address diversity in medicine and the biosciences. The Association of American Medical Colleges has recently published an update in definitions for diversity and underrepresented minorities and I thought this might be of interest to you. Their report and related conclusions follows.

Issue.

The U.S. Supreme Court decided the University of Michigan affirmative-action admissions cases, Gratz and Grutter, in the same week that the AAMC Executive Council ratified the new AAMC definition of "underrepresented in medicine." Because of this timing, neither the Executive Council nor the AAMC committee that developed the new definition had the opportunity to consider the implications of the Court's decision for the new definition. This statement is intended to advise schools on the use of the new definition in the context of the Gratz and Grutter decisions.

Background.

In June 2003, the AAMC Executive Council adopted the following:

"'Underrepresented in medicine' means those racial and ethnic populations that are underrepresented in the medical profession relative to their numbers in the general population."

This action was taken on the recommendation of a high-level committee following several years of discussion and deliberation. The focus of the committee's work was the continued viability of AAMC's then-current

definition of "underrepresented minority" (or "URM") as including only African-Americans, Mexican-Americans, Native Americans, and mainland Puerto Ricans. The re-examination of this definition resulted from: (1) the efforts of persons from racial and ethnic groups not included in the URM definition who sought access to the benefits thought to be available to those categorized as URMs (for example, special recruitment programs) and (2) efforts to make AAMC data congruent with recent changes in data collection practices as described in the federal government's Office of Management and Budget Directive 15.

"URM" has been a key concept in AAMC goal-setting and tracking and also has played a role in establishing eligibility for certain AAMC programs and those of some member institutions and affiliated organizations. Since 1969, the AAMC had articulated a goal of "population parity" for including various racial and ethnic groups in the profession of medicine. Efforts to achieve that goal include the decade-long campaign "Project 3000 by 2000," which sought to reach a level of 3,000 URM students entering medical school by the year 2000.

While the Court rejected the process used by the University of Michigan's College of Arts and Sciences to include race and ethnicity factors in a score on which it based admissions (*Gratz*), it approved the approach adopted by the Law School (*Grutter*). Thus, it is now explicitly permissible--within certain constraints--to take race into account to achieve the educational benefits that flow from a diverse student body.

One of the constraints on a permissible admissions program set out by the Court is the prohibition of "racial balancing" as a purpose. The following passage in Justice Sandra Day O'Connor's opinion of the Court was cited repeatedly by the dissenters:

The Law School's interest is not simply "to assure within its student body some specified percentage of a particular group merely because of its race or ethnic origin." (quoting from *Bakke*) That would amount to racial balancing, which is patently unconstitutional.

Consequently, because striving for "population parity" is tantamount to seeking a goal of "racial balancing," both the AAMC and its member medical schools must avoid this formulation as the animating force of our efforts. Instead, institutional language and thinking about the purpose of affirmative action must focus on the educational benefits of diversity. Using this concept, and consistent with the Court recognizing the military and business communities' need for a diverse workforce and leadership cadre, the AAMC views the educational benefits of diversity as including its contributions to improving both the cultural competence of the physicians our schools educate and improving access to care for underserved populations.

Status of the "Underrepresented in Medicine" Definition.

The revised AAMC definition accomplished three important objectives:

1. A shift in focus from a fixed aggregation of four racial and ethnic groups to a continually evolving underlying reality. The new definition accommodates including and removing underrepresented groups on the basis of changing demographics of society and the profession.
2. A shift in focus from a national perspective to regional or local perspective on underrepresentation.
3. Stimulating data collection and reporting on the broad range of racial and ethnic self-descriptions.

Conclusion.

The AAMC definition revised in 2003 should assist medical schools in understanding and responding to their local circumstances. However, in its reference to "underrepresentation," the new definition may be viewed as encouraging "racial balancing," which is expressly prohibited. For this reason, it can no longer serve the intended purpose fashioned for it pre-Grutter, namely, as the driver of institutional admissions policies.

Rather, medical schools should base their admissions policies on an explicit articulation of legitimate aspirations: to achieve the educational benefits of a diverse student body, including enhancing the cultural competency of all the physicians it educates and improving access to care for underserved populations.

Adopted by the AAMC Executive Committee, March 19, 2004

While these comments and reflections are helpful, it is important to remember that Stanford's community is really national and so a broader interpretation of what is considered "under representation" will need to be taken.

Very Successful AAALAC Review

The University was officially informed by the Association for Assessment and Accreditation of Laboratory Animal Care (AAALAC) that the results of the recent review and site visit of the animal programs at Stanford were outstanding. Based on the review, the AAALAC Council commended Stanford and its staff "for providing and maintaining a high quality program of laboratory animal care and use. Especially noteworthy were the level of facility maintenance, husbandry and sanitation; the excellent administrative support provided to the Administrative Panel on Laboratory Animal Care (A-PLAC); the effective operations of the A-PLAC, assisted by the involved and dedicated community membership; the proactive comparison of grants to A-PLAC approved protocols; the extremely knowledgeable and dedicated veterinary leadership, which supported a

collegial atmosphere between the investigative staff and the administration: and the excellent environmental enrichment and medical management programs for animals ranging from nonhuman primates to rodents.” This is an excellent review and I want to express my appreciation to Dr. Linda Cork, Chair of the Department of Comparative Medicine, and to the faculty and staff, for doing such a stellar job.

I would not be surprised, however, if many readers were unfamiliar with AAALAC and its importance to animal research and investigation. To provide background information, I am including below some of the materials AAALAC provides on its web site about why accreditation is so important.

Here are the top reasons why 650 research institutions in 18 countries have earned AAALAC accreditation...

It represents quality

Organizations and companies look for ways to communicate their commitment to excellence. In the scientific community, AAALAC accreditation shows that an institution is serious about setting, achieving and maintaining high standards for animal care and use. Around the world, AAALAC accreditation is recognized as a symbol of quality.

It promotes scientific validity

When scientific research involves animals, reliable results depend on superior animal care. AAALAC accreditation engages scientists, managers and administrators in an independent, rigorous assessment of their institution's animal program--an assessment that ultimately results in better research practices and outcomes.

It's a recruiting tool

AAALAC-accredited institutions use their accreditation as a recruiting tool to attract the best and brightest researchers and professors. Talented professionals look for high-quality programs, and accreditation assures potential employees that the institution is dedicated to achieving the highest standards for animal care and use.

It demonstrates accountability

Today, companies and organizations involved in animal research are held to very high levels of accountability--by their own constituents and the general public. Although animal research is a controversial issue for some, most people support biomedical research if it's conducted in a humane manner. Accreditation through AAALAC is voluntary, and demonstrates a willingness to go above and beyond the minimums required by law. It tells the public that the institution is committed to responsible animals research.

It provides a confidential peer-review

Accreditation requires an institution to first perform its own self-evaluation (an extremely valuable management exercise). Next, a team of highly qualified professionals provides a confidential, on-site evaluation of the institution's animal care and use program. The independent review assures management that the research program is maintaining high standards. The assessment also helps them learn how they can achieve even higher levels of good animal care and quality research.

It impresses funding sources and research partners

Many private biomedical organizations, including the American Heart Association and the Cystic Fibrosis Foundation, strongly recommend that grantees using animals in their studies be part of an AAALAC-accredited program. Government agencies such as NIH, NASA, the Department of Defense, Veterans Affairs and the National Science Foundation see AAALAC accreditation as a commitment to program excellence. Both private and public funding sources view accreditation as an assurance that animal use will be justified and humane, and that appropriate regulations and policies will be followed.

It shows a real commitment to humane animal care

Accreditation shows the world that an institution is serious about its commitment to humane animal care. It's an investment that delivers the benefits outlined above and much more. Please call for more information on AAALAC International accreditation [request information online](#).

Being Conversant with Research Compliance

Because Stanford is a research-intensive university, there are many research-related rules, policies, terms and conditions, and regulations. Representatives from the Research Management Group, Internal Audit, Property Administration and Office of Sponsored Research have launched a 1-hour "Compliance Roadshow." The purpose of the "Compliance Roadshow" is to offer updates to faculty and staff on the current focus of our sponsors as well as to touch on compliance concerns that appear to create opportunities for improvement here in the School of Medicine or university-wide. We all recognize that compliance may sometimes slow things down or appear burdensome but hopefully the Roadshow will provide some awareness and simplify your understanding. Contact Kathleen Thompson in the Research Management Group at klt@stanford.edu or 725-0661 if you'd like to invite the "Compliance Roadshow" to a faculty or staff meeting in your department.

More on the NIH Roadmap

On March 19, Dr. Jeremy Berg, Director of NIGMS at the NIH, spoke about the NIH Roadmap at the Chemistry and Genomics Symposium held by the Department of Molecular Pharmacology. He described the rationale for developing the Roadmap, the process by which it was developed, and he outlined its major components.

As you now likely know, the Roadmap grew out of concerns about how to address the rapid and revolutionary changes in science, the increasing breadth and growth in scientific missions, the complexity of the NIH organization itself, and the increasing US expenditures on health care (\$500/yr/person) versus biomedical research (\$80/yr/person). Jeremy Berg emphasized that the Roadmap is not just for translational research; it is also meant to support fundamental, core areas. He quoted NIH Director Zerhouni's comment that, "You can't translate if you don't understand." The imperative for the Roadmap is to accelerate the pace of science.

The Roadmap was developed through extensive consultation. In a nutshell, the Roadmap is:

- A framework of priorities
- A vision for a more efficient and productive system of doing research
- A set of initiatives for improving health

The Roadmap has three major themes:

1. ***New Pathways to Discovery***, which aims to deepen our understanding of the daunting complexity of biological systems;
2. ***Research Teams of the Future***, which focuses on how to build interdisciplinary and multidisciplinary research groupings as well as other, novel ways of organizing the doing of scientific work;
3. ***Re-engineering the Clinical Research Enterprise***, which addresses the need to recast the entire system of clinical research in this country

The New Pathways to Discovery, in turn, consists of five working groups:

1. Molecular Library and Imaging
2. Building Blocks and Pathways
3. Structural Biology
4. Bioinformatics and Computational Biology
5. Nanomedicine

Dr. Berg described each of these themes and working groups. He emphasized that the NIH Roadmap is a work in progress, and he encouraged the audience to keep current with the initiatives and funding opportunities available through the Roadmap through its web site, www.nihroadmap.nih.gov. "Look at it early and look at it often," he advised. Thanks to Dr. Berg and the Department of Molecular Pharmacology for this opportunity to learn more about this critically important NIH initiative.

In addition, as I noted in the March 8th issue of the Dean's Newsletter, an email-based notification announcing new NIH Roadmap opportunities is being distributed to all faculty on a weekly basis. We will also be launching a web based interactive message board where faculty with interests in these various grant opportunities can identify one another and organize responses as they see fit. This message board will be available to all Stanford faculty.

Finally, I am pleased to announce that Chris Webb has joined the School as Interdisciplinary Grants Development Manager. Chris' job will be to help organize and assemble large multi-faculty, multi departmental grant applications. He will be available to assist on grant applications involving collaborations between SOM faculty and faculty in other schools. Chris can be reached at 736-2968, or at cdwebb@stanford.edu.

Executive Committee: Managing the Professoriate for the Future

Stanford has many extraordinary features that make it excellent and unique and that have propelled it into the top echelon of American universities. But it also has some significant constraints and limitations, at least two of which impact the School of Medicine and Biosciences. These are constraints on space and, in the future, potential limitations on faculty size.

As I have noted previously Stanford is among the smallest of the research-intensive medical schools. Our size offers a number of opportunities but, given the changes in bioscience and academic medicine, it also poses some challenges. I have, in various forums, discussed the current very severe limitations we have on research space at the medical school. In the short run we are hoping to remedy this by renting laboratory space off-campus. While that might provide some relief, it is far from ideal since one of the things that has made our medical school special is the access and interactions that faculty and students have with each other – within the medical school – and perhaps even more importantly, with colleagues in other schools throughout the university. Hence, I would prefer that off-site research space be a short-term solution and that the ultimate one be new research space on campus. As I have delineated in other communications, we hope that this will be initially addressed by building the Stanford Institutes of Medicine (SIM) #1 during the next several years. However, our overall space issues will not be fully reconciled until we are able to construct SIM 2 and 3 – both of which are at least 10 years in the future and, under any circumstance, are subject to limitations in space availability through the General Use Permit (GUP). But no matter how one looks at it, limitations on the availability of research space are impacting our opportunities for new and exciting scientific pursuits – and seem likely to continue to do so. We have recently re-opened the discussion about whether we should seek to develop a “second campus”, and while this may ultimately be necessary, it is still my view that it would result in a loss of the interconnectedness that makes us unique.

The second major issue that potentially impacts our future is the size and composition of our professoriate. As I have communicated previously, we received last year a cap on the number of Academic Council and Medical Center Line faculty of 900. As of February 1, 2004, we have 732 faculty at Stanford (which includes faculty at the VA and other off-site locations as well). While this seems to leave a delta of 168 potential faculty positions, the situation is more complicated due to searches underway or recently completed and to commitments of positions to departments or institutes. Indeed, if all these were to come to fruition (and no one left or retired) we could potentially exceed the cap. However, that will not happen – both because of the reality that some faculty will

leave, some searches will not be completed and, perhaps most importantly, we will manage the pace of new faculty recruitments.

There are additional issues of concern based on the assessments of our current faculty profile and the trends that have occurred during the past decade. One is that our faculty is aging, underscoring the importance of recruiting assistant professor level faculty as vacancies and opportunities arise. Another is that we need to assure the replacement of and indeed an increase in the number of Investigator (UTL) faculty, particularly in our clinical departments. At the same time we need to better manage the distribution of faculty and focus more closely on the recruitment of Clinician Educators as opportunities permit. And, as mentioned previously in this Newsletter, we need to improve the diversity among our faculty, especially in underrepresented minorities.

To help us better manage the entry, exit and distribution of faculty now and in the future, a model has been developed in collaboration with biostatistics faculty, that can track and predict trends. At our Executive Committee meeting on Friday, April 2nd, David O'Brien, Director of Institutional Planning, presented an initial analysis of the model and how it might help us in the future to better manage faculty positions and the professoriate. As is true for any model, it is heavily dependent on the assumptions that are made, and we are examining an array of those – guided by the need to stay within the cap but also cognizant that we are able to influence the distribution of faculty profiles. Based on the data that has been accrued, the immediate conclusions follow the observations made above. Namely, we need to be thoughtful about the distribution of faculty positions within departments and between our large mission areas – Investigators (UTL), Clinician Scholar/Investigator (MCL) and Clinician-Educator. As noted, it is imperative that we expand our junior faculty through the recruitment of assistant professor level faculty. It is also imperative that we increase the numbers of Investigator (UTL) faculty throughout the school and particularly in clinical departments, to reverse a trend that has emerged during the past decade. We also need to assure that we have the right complement of Clinician/Scholars/Investigators to facilitate our mission in translational research and the correct number of Clinician-Educators to assure that our patient care mission is fully met– and seem likely to continue – impacting. There is no doubt that this will need to be an iterative and well-coordinated process and that it will require vigilance and management during the years ahead. The new model will help – but careful oversight and proactivity among our school leaders will be the most important thing we can do. Quite obviously, this will be a topic that we will revisit regularly.

The Third Quarter Begins for First and Second Year Students with New Opportunities

With the beginning of the Third Quarter, our First Year Students began the new organ/system based curriculum under the banner of “Human Health and Disease,” and our Second Year Students began their preparations for entry to the Clinics with “Clinical Problem Solving.” I had the opportunity to welcome the students to these significant new phases in their education, to thank them for all that they had done in making the year to date so exciting for the faculty and their respective colleagues and to encourage them to

continue to attend classes. While it is possible to review classes on streaming video, there is no substitute for direct involvement. I strongly encourage our students to engage with faculty and their fellow students by active class participation. We are all eager for this to take place.

Media Training

As recognized medical experts, School of Medicine faculty members are often called upon by the media to talk about their work or provide comment on new developments in their respective fields. But it requires skill, experience, and understanding of the media to conduct an effective interview, whether it's for a print or a broadcast outlet. The Office of Communication and Public Affairs is offering two workshops for faculty members to provide them with guidance on dealing with the media and on the most effective methods for getting their message across.

Faculty can opt for one of two introductory workshops, held on Friday, April 30 from 1:30 p.m. to 3:30 p.m. and Thursday, May 6 from 9:30 a.m. to 11:30 a.m. Both workshops will be held in CCSR Room 4105. Coffee, sodas and snacks will be available. More extensive media training, in which participants will practice their skills on camera, will be offered to interested faculty at a later date.

Faculty members who plan to attend one of the introductory workshops should RSVP by Monday, April 26 to Jocelyn Baluyut, 723-6911, jocelynb@stanford.edu.

I strongly encourage faculty to participate in these media training opportunities.

Awards and Honors

- **Dr. Ajay Chawla**, Assistant Professor in the Department of Medicine, has been awarded one of the three 2004 Charles E Culpeper Medical Scholar Awards from the Rockefeller Brothers Fund. This is a highly competitive award and Dr. Chawla's selection is evidence of his accomplishments to date and academic promise for the future. Congratulations to Dr. Chawla.
- **Dr. Irv Weissman** will be awarded the 2004 New York Academy of Medicine Medal for distinguished contributions to biomedical research. The Award will be presented at the annual Spring Stated Meeting of the Fellows on May 24. Congratulations (once again) to Dr. Weissman.

Appointments and Promotions

- **Laura Attardi** has been reappointed to Assistant Professor of Radiation Oncology and of Genetics, effective 11/1/2004.

- **Nicholas Denko** has been reappointed to Assistant Professor of Radiation Oncology, effective 11/1/2004.
- **Aaron Straight** has been appointed to Assistant Professor of Biochemistry, effective 4/1/2004.
- **Mylene Yao** has been appointed to Assistant Professor of Obstetrics and Gynecology (Reproductive Endocrinology and Infertility) effective 4/1/2004.

Dean's Newsletter

April 19, 2004

Dean's Newsletter – More to Come

First, thanks to everyone who filled out the recent survey regarding the Dean's Newsletter. Some 533 completed surveys were returned, 43% of which contained additional comments or suggestions. It is hard to know the actual denominator other than the number of names on the email distribution list – and using that the response rate to the survey was approximately 30%.

The bottom line is that 98% of the respondents felt the Dean's Newsletter was "Highly Valuable" (76%) or "Somewhat Valuable" (22%) as a communication document. Moreover, 88% of the respondents read the Newsletter either every time or most of the time that it was sent. Further, 88% rated its quality "high" or "superior".

Most of the comments focused on the length of the Newsletter, although 54% of the overall respondents indicated that it was the "right length". That said, a number of helpful suggestions were made for reducing the length or frequency of the Newsletter or using technologies to make it more readable.

One of the most consistent comments was that readers appreciated this as a communication vehicle directly from the Dean – and strongly indicated a desire to have that continue. I am happy to do so. I will explore and evaluate other ways to make the presentation of the Dean's Newsletter more attractive and readable but I will also continue to make it a personalized communication vehicle.

Thank You From First Year Medical Students

Last week a Letter to "Administration, Professors, Preceptors, Facilitators and those involved in planning, implementing and supporting our education" arrived signed by 48 members of the First Year Class. It was surely welcomed by all those who have worked diligently on helping to construct and implement the New Stanford Curriculum. Importantly, the letter was accompanied by very helpful comments and suggestions

focusing frequently on the benefits of the reduced class time, better coordination and integration of classes, the new Scholarly Concentrations, advising and overall camaraderie and support within the School.

In turn, I would like to thank the students for being forthright, engaged committed to working as partners and colleagues in making the Stanford New Curriculum experience as strong and meaningful as it can be.

Stanford Institute for the Environment

At our Senior Dean's Meeting on April 8th, Drs. Jeff Koseff, Gary Schoolnik, and Leigh Johnson offered an update on the plans underway for the Stanford Institute for the Environment, which will be one of the major interdisciplinary themes guiding Stanford during the next decade. The current mission of this important initiative is as follows: *Spanning the University, the Stanford Institute for the Environment will promote an environmentally sound and sustainable world by developing creative solutions through these challenges through the integration of science, technology and policy; educating the next generation of leaders and problem solvers; and actively collaborating and facilitating dialogue with key public and private leaders and the broader community.*

While considerations about the environment understandably focus on topics like population, water, energy, agriculture, ecosystems, conservation and biodiversity, urban systems, industry, it is also important to remember that the environment and health are very closely linked. Indeed, most human ailments are the result of the interaction of simple or complex genetic traits and predispositions with environmental exposures or risk factors.

Dr. Gary Schoolnik, Professor of Medicine (Infectious Diseases) and of Microbiology and Immunology, is a member of the Task Force for the Institute for the Environment as a representative from the School of Medicine. He has clearly recognized the importance of this initiative to environmental health, ecological medicine and medical geology. Based on that Dr. Schoolnik has posited several important fields of study that link the environment and medicine. These include such areas as:

- ***Environmental toxicology*** - which considers disease as a function of toxin exposure that can be mediated by genetic factors and be manifested as clinical disease or syndromes.
- ***Infectious diseases*** – which can be influenced by climate, landscape, insect or other vectors and intermediate hosts – and which can be affected by global transportation, immigration and commerce.
- ***Human physical and intellectual development*** – which can be impacted by food, water, agricultural and commercial practices, and toxin exposure.
- ***Population and crowding*** – which impact on disease risk and survival.
- ***Biodiversity*** – and its impact on drug discovery.

These and other related areas broach a wide array of medical disciplines and research topics and offer new opportunities for training as well as for impacting human disease on a global basis. The Stanford Institute for the Environment is at a nascent state and I would strongly encourage interested members of the Medical School community to contact Professors Schoolnik (schoolni@cmgm.stanford.edu) or Koseff (koseff@stanford.edu) with additional comments or suggestions. I think there is a wonderful opportunity for our faculty and students to help shape the future of this very exciting new Institute.

The Match Continues (Progress Made on the Lawsuit Challenging the National Internship Match)

As many of you know, the National Internship Match was challenged a couple of years ago by three former residents who contested that it violated antitrust law in a suit brought against a number of teaching hospitals across the country including Stanford Hospital & Clinics. Last week, due to a successful advocacy effort that involved, among others, the Association of American Medical Colleges, the American Hospital Association and officials from Stanford including Stanford University Hospital CEO Martha Marsh, the US Congress approved legislative provision that exempts residency matching programs and their sponsors from antitrust laws. The President is expected to sign this legislation that includes the match provision this week. While the group supporting the match system believes that this legislation will help lead to a successful conclusion of the lawsuit, the provision may be subject to future legal and legislative challenges. I will keep the community posted.

Women Faculty Would Like More Flexible Work Schedules

During my first year at Stanford, Dr. David Stevenson and I appointed a committee, chaired by Dr. Mary Lake Polan, to assess the status of women in medicine and the biosciences at Stanford. Dr. Polan and her colleagues have now reported the results of their survey in several settings (<http://deansnewsletter.stanford.edu/>) and have now published their findings in the April issue of *Academic Medicine* (2004; 79:319-325).

In their study, 163 (53%) of the women faculty at Stanford School of Medicine identified the need for greater flexibility in the work environment as their highest ranked need. They were especially concerned that women faculty with young children have flexible schedules without negative consequences. In addition, periodic sabbatical leaves from clinical and administrative duties and departmental mentoring for academic career development were also cited as key needs.

Since this report, we have made some progress in implementing some of these initiatives. However, I would say that we still have a long way to go to truly make the work environment as compatible with work-family balance as we would all like. This must be an ongoing and continued initiative and it is important that we continue to assess our progress and improve our outcomes. Any additional thoughts you have would be most

welcome.

In Memoriam: Dr. Robert W.P. Cutler

I am sorry to say that Robert W.P. Cutler, M.D., Professor Emeritus of Neurology and Neurological Sciences and former Senior Associate Dean for Faculty Affairs in the School of Medicine, passed away on April 12, 2004 at his home in Livermore, California. Dr. Cutler received his undergraduate degree from Harvard College and his medical degree from Tufts Medical School. He completed his medical training in neurology at the University of Chicago Clinics. Prior to his arrival at Stanford, Dr. Cutler served on the faculty at Harvard Medical School and the University of Chicago. During his tenure on the faculty at Stanford, he played many administrative roles, including service as the first Associate Dean for Medical Education and later as Senior Associate Dean for Faculty Affairs. Dr. Cutler retired from Stanford in January, 2000. He is perhaps most recently known for the publication of his book entitled “The Mysterious Death of Jane Stanford” that received considerable notoriety – at least locally – during the past year.

There will be a memorial service for Dr. Cutler on Tuesday, May 11 at 4:00pm at the Stanford Memorial Church. Also, in lieu of flowers, the family asks that contributions be made to the Regional Parks Botanic Garden (c/o Tilden Regional Park Berkeley, CA 94708-2396).

Welcomes

I am pleased to welcome **Dr. Ann James** who is joining the Office of the General Counsel as a Senior University Counsel representing the Stanford Medical Center, primarily the School of Medicine. She will also provide advice and counsel on healthcare issues to the Stanford Hospitals. She holds a BA in Biology from Radford College in Virginia, a Ph.D. in Medical Microbiology and Immunology from Baylor College of Medicine, and a J.D. from the University of Houston. Ann is replacing Rodney Johnson who served the School and University so admirably during the past 24 years.

I also want to welcome back **Mr. David Glen**, formerly the Director of Principal Gifts for Stanford University, who will return from retirement on a part time basis to provide strategic advice and guidance to the Office of Medical Development during its important transition while we search for a new Director.

Honors and Awards

- **Dr. Stuart Kim**, Professor of Developmental Biology, has been named this years recipient of the prestigious Ho-Am Foundation Award for “scholars and researchers who have made outstanding achievements...and present exemplary models for the academic community” The Ho-Am Prize was founded in 1990.
- **Dr. Andy Fire**, Professor of Pathology, has been named the 2004 recipient of the prestigious Dr. HP Heineken Prize for Biochemistry and Biophysics, from the Royal Netherlands Academy of Arts and Sciences.

- **Dr. Jeffrey Axelrod**, Assistant Professor of Pathology and **Dr. Michael Longaker**, Deane P. and Louise Mitchell Professor in the School of Medicine, were elected this past weekend to the American Society for Clinical Investigation.
- **Dr. Larry Leung**, Professor of Medicine (Hematology), was elected into the Association of American Physicians.
- **Dr. Olivia Martinez**, Associate Professor of Surgery, has been named the recipient of the Fujisawa Basic Science Achievement Award by the American Society of Transplantation. The award honors investigators at the associate professor level who have made substantial contributions to the field of transplantation medicine. Dr. Martinez will receive the award at the American Transplant Congress in May.

Please join me in congratulating these faculty members for their wonderful achievements.

Honorable Mention

Congratulations to Cheri Blauwet, first year medical student here at Stanford, who took first place in the women's wheelchair division race at the 108th Boston Marathon in a time of 1:39:53.

Announcement

The 2004 Beckman Symposium on Cancer will be held on Friday, April 30th from 7:00 a.m. to 5:00 p.m., in the Fairchild Auditorium beginning with breakfast in the Fairchild lobby. There will be a host of distinguished speakers including Brian Druker, Patrick Brown, Napoleon Ferrara, Elaine Fuchs, Stanton Glantz, Lee Hartwell, Vicki Lundblad and Nicola Pavletich. This will be an outstanding symposium and it is open to the public, no registration is required.

Appointments and Promotions

- **Ranjana Advani** has been appointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 4/1/2004 to 3/31/2007.
- **Edward Damrose** has been appointed to Assistant Professor of Otolaryngology at the Stanford University Medical Center, effective 5/1/2004 to 4/30/2007.
- **James Fann** has been promoted to Associate Professor of Cardiothoracic Surgery at the Stanford University Medical Center, effective 5/1/2004 to 4/30/2009.
- **Lynne Huffman** has been promoted to Associate Professor (Research) of Pediatrics and Associate Professor (Research), by courtesy, of Psychiatry and Behavioral Sciences, effective 4/1/2004 to 3/31/2010.
- **Stephen Huhn** has been promoted to Associate Professor of Neurosurgery and Associate Professor, by courtesy, of Pediatrics at the Stanford University Medical Center, effective 4/1/2004 to 3/31/2009.
- **John Lamberti** has been appointed to Associate Professor of Cardiothoracic Surgery at the Lucile Salter Packard Children's Hospital, effective 4/1/2004 to 3/31/2009.

- **Anna Messner** has been promoted to Associate Professor of Otolaryngology and of Pediatrics at the Stanford University Medical Center, effective 4/1/2004 to 3/31/2009.
- **Amin Milki** has been promoted to Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 4/1/2004.
- **Jeffrey Norton** has been appointed to Professor of Surgery at the Stanford University Medical Center, effective 4/1/2004 to 3/31/2009.
- **Todd Pawlicki** has been reappointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, effective 6/1/2004 to 5/31/2007.
- **Debra Safer** has been appointed to Assistant Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 5/1/2004 to 4/30/2007.
- **Steven Sanislo** has been reappointed Assistant Professor of Ophthalmology at the Stanford University Medical Center, effective 5/1/2004 to 4/30/2006.
- **Zijie Sun** has been promoted to Associate Professor (Research) of Urology and of Genetics, effective 4/1/2004 to 3/31/2010.
- **George Van Hare** has been promoted to Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 4/1/2004.

Dean's Newsletter

May 3, 2004

Stanford and the AAMC Institute for Improvement in Medical Education

To date we have not participated in the Institute for Improvement in Medical Education that was initiated by the Association of American Medical Colleges (AAMC) in the Fall of 2002. Nonetheless it is notable how many of the issues raised by the IIME work group have already been addressed – and in a number of cases implemented – at Stanford. That said, it is always helpful to assess our progress against the reflections of others in the field of medical education.

At the AAMC Council of Dean's Meeting that was held from April 24-27th, Dr. Joe Martin, Dean of the Faculty of Medicine at Harvard, reviewed some of the preliminary findings of the IIME Work Group he chaired. He noted that while there have been changes in medical education during the past decade, most of the attention in medical schools around the country has been directed to the first two years of the curriculum. Little change has occurred in re-engineering the clinical training. Moreover, resident education is seen as unlinked and as not necessarily adequate in preparing physicians for the practice of medicine. In tandem with this is the fact that the continuing education of physicians is not employing education methodologies likely to impact meaningfully on the quality or type of clinical care they provide.

The Committee identified as one of the major problems the fact that each of the phases of medical education (undergraduate, graduate, postdoctoral training and continuing medical education) is governed by different oversight bodies (e.g., LCME, NMBE, RRC) that neither communicate with each other nor even have overlapping goals and objectives. Based on this, the committee identified the need to better coordinate medical education across the continuum of learning. As many of you know, this is one of our major goals in the new Stanford Curriculum.

The IIME will be calling for reforms in medical education, in which we will also participate in. At this stage they have identified some of the key initiatives that should be pursued. Among the programmatic reforms the IIME has identified are the following. The state of our Stanford progress is noted in red.

- “The need to present early in the curriculum a patient-centered clinical experience that will imprint on entering students the importance of viewing a patient as a person, a member of a family, and a member of a community”. **As we look to the future at Stanford, we have already initiated this by introducing issues and topics in clinical medicine into the first year curriculum – both by integrating clinical problems into basic science and by the breadth of the new courses :Health and Human Disease” and “Practice of Medicine”.**
- The IIME notes “medical schools and residency programs should provide clinical learning experiences in an interdisciplinary nature for the purpose of preparing future physicians to function effectively as team members”. **This is an important focus at Stanford both in the interdisciplinary “Mechanisms of Human Disease” as well as in the exposure to various interdisciplinary themes that emerge from our Scholarly Concentrations (see <http://med.stanford.edu/md/curriculum/>).**
- The IIME recommended that “medical schools and residency programs should establish rigorous formative and summative assessment programs to ensure that students and residents are acquiring the knowledge, skills, attitudes and values deemed necessary at their stage of learning, and that they are able to perform in a developmentally appropriate manner the complex, integrative tasks required to provide patient care”. **This is clearly an important area and is not one we have achieved. Indeed our evaluation process for students is still far from the level of excellence I would like to see in place. Moreover, while a number of our residency programs do quite an excellent job in resident evaluation, there is inconsistency across programs. This is surely an area where we need greater and more consistent focus, both in undergraduate and residency education and across the entire continuum of medical education.**
- IIME recommends that “medical schools should provide students meaningful experiences with physicians engaged in a variety of career activities...and should offer a variety of joint degree and research training programs, and should be flexible in tailoring programs that allow students, residents and practitioners to acquire the education needed to pursue specific career goals”. **Although we**

certainly have more work to do, I think we already excel in these areas. Stanford's curriculum for medical student education has been long defined as highly flexible. The additional changes now being brought into relief, especially with the Scholarly Concentrations and the opportunities for joint degree programs they bring, should put us in the forefront of this important area. Further, discussions are beginning with the other graduate and professional schools at Stanford about further reforming graduate education *writ large* to create an environment of true cross-school joint degree education.

- Following this theme, the IIME recommends that “medical schools should explore the possibility of integrating into undergraduate, pre-medicine programs some of the course work required in the biological sciences, bioethics, the medical humanities, informatics, communication skills and health systems”. **One of our future goals is to improve the alignment between the undergraduate college curriculum at Stanford and the undergraduate medical curriculum. Some of this exists informally through the program in Human Biology as well as in the Sophomore Seminars available to undergrads. Moreover, an ever-increasing number of our medical school faculty are engaged in teaching undergraduates. The number of undergrads who are either involved in research at the medical school or who are pursuing community services relevant to medicine and healthcare is also increasing. That said, there is certainly much more we can do in this important area and I hope we will make progress in this important area in the years ahead. One way of integrating these programs will emerge when SMILE (the Stanford Medicine Information and Learning Environment) becomes a reality.**
- Further, the IIME noted, “medical schools, residency programs, and accrediting bodies should explore the possibility of providing opportunities for residency requirements to be integrated into the medical school curriculum”. **One of the major concerns is reducing the length of training – especially in some of the surgical programs that require five or more years of residency training. Clearly this is important, especially given the debt burden of students and, equally important, the need to preserve some semblance of work-family balance. At the same time, I believe one of our greatest opportunities and needs is to better integrate clinical medicine and basic science through the lifetime of the trainee as well as the practitioner. In addition, we need to anchor medical residency with opportunities to pursue “scholarly concentrations” analogous to those now being developed for our medical students. Rather than requiring our students to take in new knowledge in discrete bits, often at a rapid-fire pace and in staccato rhythm, it seems much more sensible to provide them with in depth and integrated experiences that would result in more of a learning continuum. We are now exploring how to make this happen and I hope that this will be another area where Stanford can take the lead.**

- To improve education, the IIME notes that “medical schools should develop and support a cadre of teaching faculty whose main responsibility is the education of students as they progress through the educational program...(and further) that medical schools should require faculty members and residents who have regular contact with students to complete periodically a program orienting them to the goals and objectives of the educational program as a whole...(and that) medical schools and teaching hospitals should share learning resources (e.g., simulation laboratories, standardized patient programs, information technology applications, etc) to ensure that learners at each stage of their education receive the highest quality education experience”. **We are fortunate to have at Stanford faculty members like Professor Kelly Skeff who have developed programs for training faculty and residents to become more effective teachers. At the same time, we are not using these programs broadly or effectively enough, and I believe we must do more to inculcate a tradition of teaching excellence that permeates throughout our community. While a number of medical schools (e.g., Harvard, UCSF) have developed “Academies” to foster a cadre of excellent teachers, I think it is important for our entire faculty to take responsibility for teaching excellence. That said, one of the major challenges that virtually every medical school is facing, especially for clinical faculty, is how to pay for the time spent teaching, given the expectation that clinical faculty earn their salary through funds emanating from clinical care or research grants. While we have restructured the School’s Operating Budget to focus more specifically on education – and especially on small group teaching –our available resources fall short of what is necessary to adequately fund teaching. Accordingly, one of our important development objectives must be to raise endowment dollars to help support education – in the form of professorships as well as teaching supplements that permit clinical faculty to free up time for teaching. We also need to garner a better understanding of all of the resources available across the medical center to support teaching – including the Graduate Medical Education dollars that come to both the Stanford Hospital and Clinics and the Lucile Packard Children’s Hospital through Medicare or the Children’s Hospital GME Bill. Finally, we are committed – and we are already making progress to addressing ways to share teaching resources, we expect that SMILE will play an important role in this matter. Equally importantly, we want to be sure that we optimally utilize the distributed resources that emerge from SMILE as well as the centers for simulation that now exist at the VA Hospital as well as in the Departments of Surgery and Pediatrics – and that are housed (or will be) at SHC and LPCH.**

I was very pleased to learn more about the work of the AAMC Institute for Improvement in Medical Education. Clearly this work group has highlighted some important issues and has drafted some very reasoned recommendations. We will no doubt participate in this initiative as it matures. But, at the same time, it is comforting to know that we have already identified a number of these issues during our efforts to reform our educational curriculum at Stanford and that we have, in fact, made considerable progress to date.

Since one of our overarching goals has been to serve as a role model among research-intensive medical schools, I would say that in the area of medical education, we are clearly fulfilling that goal.

Stanford is a Leader for Postdoctoral Scholars

Postdoctoral scholars and trainees – both in research and clinical medicine – comprise the largest single community in our Medical School – exceeding the number of medical and graduate students as well as faculty. We have long known that postdoctoral scholars are among our most important assets, contributing enormously to our research, clinical care and education missions. Around the nation, however, postdoctoral scholars are a more silent majority and are frequently less well supported or recognized than should be the case. Thankfully, at Stanford, there has been a long tradition in supporting postdoctoral scholars. In fact, the first postdoc office began at Stanford in 1989 and led *Nature* (2004;428:690-691) to refer to us as a “trailblazer” in this important area. Over the years a number of improvements have occurred in securing better compensation and benefits for our postdocs as well as in improved mentoring and career guidance. These important issues have become topics for a national debate emanating in part from the review and update by the National Academy Committee on Science, Engineering, and Public Policy (COSEUP) that can be viewed at www.nationalacademies.org/postdoc.

On Wednesday, April 21st, the Stanford Postdoc Association held a Town Hall meeting to review a number of the issues and challenges they face. Thankfully, the group and its leadership are working quite cooperatively with the Dean’s Office and our Postdoc office and have been successful in addressing a number of important issues, even though many remain to be solved. Again, these are also part of a broader national agenda and can be viewed on the National Postdoc Association website at www.nationalpostdoc.org. We remain committed to working as closely and cooperatively as possible with our postdoc colleagues to make their personal and professional opportunities as successful as possible.

Health Education Asset Library (HEAL)

At the recent Council of Deans’ meeting I became aware of a digital library that offers multimedia-teaching materials. Referred to as HEAL it began as a California consortium in 1999 (that included Stanford) and now provides images, video and audio clips, animations and presentations, in what is a continuing work in progress. It is accessible at <http://www.healcentral.org/index.jsp>. I have reviewed it and suggest you take a look at it for materials that might be helpful for either teaching or learning.

More on the NIH Roadmap from Dr. Zerhouni

In previous editions of the Dean’s Newsletter I have provided background material and updates on the NIH Roadmap (<http://nihroadmap.nih.gov/>). As many of you know, this is a work in progress. On Saturday April 24th, Elias Zerhouni, Director of the NIH, gave his own version of the status of the NIH Roadmap to the Council of Deans. Because this

has been discussed in other settings, I will only provide a few highlights of Dr. Zerhouni's comments and observations.

Not surprisingly, Dr. Zerhouni began by defining the rationale for the Roadmap, which includes the need to address evolving public health challenges such as the shift from acute to chronic illness, the aging of the population, the increasing disparity in health access and outcomes, globally emerging diseases and the unfortunate need to address biodefense. Coupled with this are the extraordinary expenditures on health in the USA – now nearly 15% of the GDP and rising. Of course while this has been happening, there have also been some extraordinary scientific advances, including the human genome project, the emerging findings in proteomics, the insights from integrative biology, and information technology. Fundamental to the future is to use these and related insights and discoveries to develop interventions before the symptoms of disease emerge. This will have positive consequences on both disease morbidity and the cost for care. It is Dr. Zerhouni's hope that the Roadmap can help catalyze some of these efforts, even though it will itself be only a small portion (1% or less) of the overall NIH budget. Importantly, Dr. Zerhouni stressed the importance of making sure that the nation's investment in basic research was sustained and that there is sufficient funding in the RO1 pool so that young investigators do not become discouraged. He went on to say that the success rate should not fall below 20%. Obviously we will have to see how that pans out.

As you know, one of the themes of the Roadmap is to foster the creation of resources that would be difficult for any one medical center or institute to develop on its own. This will require the need to build public access data bases that will contain molecular libraries and imaging probes. This will necessitate new organizational models that will require multidisciplinary and interdisciplinary themes as well as resource sharing.

Another important goal of the Roadmap is to migrate clinical research (especially patient-oriented investigation) from a cottage industry to a more successful enterprise. This task is difficult given the current financial landscape in academic medicine, where margins are continuing to decrease, making opportunities for investment more challenged. This will require new partnerships, which Dr. Zerhouni believes need to include the patient community and a much better linkage to community based health providers. This will also require regional and national research networks. It is of interest that the NIH has already announced its plans to help support some regional translational research networks. This is something Stanford is already exploring with its colleagues in PharmaStart (<http://www.pharmastart.org/>). Further details about those efforts will be provided in the months ahead. Importantly, Dr. Zerhouni recognizes that the number of patients currently enrolled in clinical trials is quite low in the USA – something that needs to improve. Not surprisingly, from my perspective, the now decades long experience in pediatric oncology provides a model for increasing participation in clinical trials as well as evidence of the impact they can have. Today more than 70% of children diagnosed with cancer in the USA are enrolled in a clinical trial. Clearly this type of model needs to be extended to other areas of medicine.

While the financial investment in the Roadmap is intended to be kept small, its impact can be quite large. Among the most important outcomes will be assuring that the public trust in medicine – and clinical research – is sustained, and that the public continues to value the nation’s investment in biomedical research. It is of course equally important for the Congress and government to share this value. But, hopefully, the Roadmap will also foster new dialogues and opportunities that will create an amplification effect to enable us to improve our work in translational medicine and education as well as to continue our investment in the pursuit of knowledge through basic biomedical research.

Thoughts on Service Lines and Clinical Cooperation from the Council of Deans – and this Dean

Just as the rapid changes in research are yielding new interdisciplinary models that break down traditional departmental or discipline-specific barriers and thus open up new opportunities and vistas, the same is also happening in clinical medicine. While some approach the new clinical venues with zest and excitement, in a number of quarters there are protests and anxieties, largely because new technologies and innovations breach the traditional academic departmental boundaries and create avenues for competition over increasingly scant resources – especially money. Despite that, it is imperative that we find ways to rise above these financial boundaries and do what is best for our patients, trainees and institutions.

It is notable that in the past weeks the issue of “service lines” or service centers has been a topic of opportunity and concern at Stanford although this is certainly not new. As you know from the joint planning activities between the School of Medicine, Stanford Hospital & Clinics (SHC) and the Lucile Packard Children’s Hospital (LPCH), we have identified four major areas that integrate our efforts under the overarching umbrella of the Stanford Institutes of Medicine – Cancer/Stem Cell, Cardiovascular Medicine, Immunity/Transplantation/Infection and Neurosciences. These efforts will bring together leaders across departments and embrace basic research and clinical faculty, as well as faculty in other schools at Stanford. These four areas in many ways will serve as our flagships, although they should not be taken to connote areas that are either academically more important or that are more valued either by our patients or by our faculty and staff. For example, in addition to these areas, SHC will be making strategic investments in orthopedics and its related disciplines.

At the same time, several other interdisciplinary initiatives will unfold – some of which have had some difficulty getting off the ground, in part because of the aforementioned struggles over resources, authority, etc. Perhaps the most current example of this within our midst is the “Vascular Center”, which despite dozens of meetings and decisions has yet to be fully embraced. Because I believe these new alignments better serve our patients and offer improved venues for interdisciplinary training for our residents and fellows, I am committed to doing everything I can to bring these new alignments to fruition, as long as they truly improve patient care and education and offer opportunities for research collaborations. Needless to say, they must also make financial success for the faculty, departments and the hospital.

Interestingly, the issue of service lines and new clinical alignments was a topic of discussion at the Council of Deans meeting on April 26th. Based on evaluations done at multiple medical centers it now seems that nearly all have some form of a service line structure, this represents a major migration over the past 10-15 years. While the perceived wisdom a decade ago called for vertical integration in academic medical centers, the negative consequences in many have underscored that a more sensible route is through horizontal integration. In that arrangement, alignment between like clinical services (e.g., neurology, neurosurgery and psychiatry, or cardiology and CV surgery) appear to make more sense. In a number of ways, that is consistent with our plans to align around the Stanford Institutes of Medicine along with their matched clinical centers at SHC and LPCH. At the Council of Dean's meeting, a considerable part of the discussion focused on the characteristics of the individuals who might best lead such service lines – and equally on the resources and authority they would need to be successful. It was recognized that the types of leaders for service lines not infrequently varies over time according to the stage of evolution of the program - for example, for the initial phase and start up, an individual with more entrepreneurial skills might be best, whereas during the growth and transition phase, individuals with more of a visionary leadership style can be more effective. The ability of these leaders to affect change comes from their real or symbolic power and the resources they control. Accordingly, in the process of defining the service-line or center, it is important to assess strategically the phase of development, the resources that can be extended and the skills of the individuals being asked to assume leadership roles. It is important to note that there was recognition about continuing to support the departmental structure, especially for training of students and residents.

It was, of course, interesting to learn from deans from other medical schools that they are struggling with how to get these models correctly placed. Some seem to be doing better than others – but all have some challenges. We certainly fall into that mix. Certainly our major service line areas are just getting started (or more correctly, in some cases, restarted) but in other areas, like our vascular center, we still have some important issues to address. However, I am adamant about addressing the challenges because I believe that a number of these new alignments are better for patient care, provide more stable and even futuristic educational opportunities, and offer new opportunities for research.

Personal Reflections on a Hot Day with a Long Road Ahead

Each of us, in our own unique and sometimes private ways, makes choices about the paths we will follow in life, the adaptations we might make and the ultimate goals (and dreams) that motivate or inspire us. While it is sometimes possible to compartmentalize these according to our personal or professional lives, they not infrequently fuse and often one facet illuminates something about who we are in a different and sometimes unconnected way.

We all make choices - to be a scientist or physician, to pursue academics or business, to be outspoken or silent, to lead or to follow. Some of our choices are planned, others

coincidental. Some fit us well and others seem asynchronous with who we otherwise seem to be.

For as long as I can remember, I have resonated to taking on challenges - more often than not ones that are difficult to achieve. Certainly that has guided much of my professional life, especially my research career, and even my decision to take on the challenge of helping to lead and guide an academic medical center like Stanford at this point in history. But we all have other facets of our personalities that further shape who we are – or not. Among my avocations are learning more about history and literature (of course in addition to science and medicine) and improving my physical endurance. The latter emerged from a childhood that was punctuated by significant asthma that negated most forms of exercise or athletics.

Some 25 years ago I decided to take up running – initially just enough to get “in shape” – but perhaps not surprisingly, over time, to achieve longer distances. That was fueled by the ironic observation that increased physical activity seemed to improve my asthma. Over the subsequent years, running has complemented my work schedule – and facilitated my history/literature learning by simultaneously listening to unabridged books on tape. During that time, I have also participated in a number of marathons – not competitively – but just sort of “in the pack”. While I do think that preparing for these marathons has many redeeming physical benefits in its own right, I have long found that they improve my mental and emotional endurance so that I am less daunted by big or difficult challenges – or perhaps that is what I simply try to convince myself.

Last year I had the opportunity to participate in two marathons, both in California, and in both I was able to achieve finishing times that “qualified” me for the Boston Marathon (of course in my age group – as an ever aging athlete). Having always lived on the east coast, I have marveled at the wonderful training conditions in the Bay Area and have revelled in my early morning runs around the Stanford campus. The cool morning temperatures have certainly convinced me about the correlation between ambient temperature and performance.

So participating in this year’s Boston Marathon posed some new challenges and offered the opportunity to learn something about myself. Although the day before and after the April 19th race day were cool, it was blazing hot at the noon-time start of the Boston Marathon – with a temperature over 85 degrees. I generally wilt in the heat – and the hours of waiting for the 26.2 mile run to begin from the Hopkinton start en route to Boston was no exception.

I generally like these races because they also afford an opportunity to be anonymous and to share a human experience with a group of people who are each competing as individuals but who are also sharing a common challenge. On that day, even though everyone has run prior marathons fast enough to qualify for Boston, nearly all felt the oppression of the heat.

I made the decision at the outset to move forward – and to keep moving forward – and to not stop running until the end of the race, regardless of how long that took. I also made the decision to slow down enough to avoid getting overheated or dehydrated - and to avoid being one of the more than 1000 individuals who needed medical assistance during the day's race. I found I had to dig deep and to be focused. I also found that I kept thinking about patients that I had cared for over the years – mostly children and teenagers with cancer or AIDS – and reflected on the much more important challenges they faced and how that might inform my own. These are of course different facets of human endurance.

I was pleased to finish even though it took more than a minute more per mile than I would usually run to complete the course. But I was more pleased because it was an affirmation about who I thought I was – or at least want to be: someone who can take on unexpected challenges and endure. The marathon is simply symbolic because the much more important issue for me is the work that I do every day – during my “day job”. Of course here the challenges are even more daunting and the stakes much larger. But here too, I am determined to give it everything I have – to make the Medical School, Medical Center and University a better place. This may be a long road – but I am prepared to keep moving down it and hope to get help from each of you so we can finish together – successfully.

Another Successful Beckman Symposium

On April 30th another in the outstanding annual Beckman Symposia took place in the Fairchild Auditorium, this one focused on cancer. It featured an array of topics ranging from basic cancer biology to innovative translational medicine to public policy and politics. The speakers were, as expected, outstanding and the information they provided was both wide-ranging and highly informative. Such events require enormous planning and I want to thank the Beckman Center Director, Dr. Lucy Shapiro, for her outstanding leadership. Thanks also to the 2004 Beckman Symposium Co-Chairs, Drs. Gilbert Chu and Roel Nusse and to Dr. Ron Levy for making the program so outstanding. However, none of this would have happened with the level of excellence that was displayed without the dedicated and diligent efforts of Ms. Belinda Byrne. This was a special event and I am appreciative to those who made it happen – and to all who attended.

Women's Health @ Stanford Sponsors National Women's Health Week Activities

Dr. Linda Giudice, Stanley McCormick Memorial Professor in the School of Medicine and Director of Women's Health @ Stanford, has informed me of the many important activities being planned for the 5th Annual National Women's Health Week, May 9-15, 2004. These include sessions on women and cancer, weight management for women, cancer-related topics, and pregnancy. Admission to these events is free, although reservations are encouraged. Details may be found on the new web site for Women's Health @ Stanford at: http://womenshealth.stanford.edu/nat_whealth_week.html. Through attendance at these events, women from throughout the Bay Area will have the opportunity to experience how Stanford's interdisciplinary approach to Women's Health

can generate increased knowledge, improved clinical care and the type of compassion so important to achieving enhanced health and well being. Thanks to Dr. Giudice and her colleagues at Women's Health @ Stanford for their fine work in this area.

Ryan Adesnik Becomes Head of Federal Relations for Stanford University

Ryan Adesnik, who joined the Dean's Office a little more than one year ago as Director of Government Relations for the School of Medicine, has been appointed Director of Federal Relations for Stanford University. In this new, expanded role, Ryan will represent the entire University as well as the School of Medicine on issues related to the Federal government. He will continue to work with the School's faculty and leadership on the many critically important School-specific government affairs issues. Ryan will maintain an office in the Dean's Office and will continue to be available to the School's faculty for consultation and advocacy activities. He can be reached at 725-3322 or at radesnik@stanford.edu. Congratulations to Ryan, and we look forward to continuing to work with him on behalf of both the School of Medicine and the University.

Events

Community Lecture Series. In our continuing lecture series to educate the community about important research findings or issues impacting patient care, **Dr. Paul S. Buckmaster**, Assistant Professor of Comparative Medicine and of Neurology and Neurological Sciences, will lecture on *Epilepsy: Insights From a Comparative Approach* on Wednesday, May 5, 2004 at 7:00 p.m. in the Clark Center Auditorium. If you have any questions, please call 650-361-0995.

Honors and Awards

- **Dr. Stanley N. Cohen**, Kwoh-Ting Li Professor in the Department of Genetics was named this year's recipient of the Albany Medical Center Prize in Medicine and Biomedical Research for the seminal work he performed in the 1960's and 1970's that formed the basis of genetic engineering. Although relatively new, the Albany Medical Center Prize has quickly become one of the most prestigious awards in academic medicine. Dr. Cohen shares the prize with his long time collaborator Dr. Herb Boyer from UCSF. Congratulations to Dr. Cohen for another outstanding achievement that recognizes his important work.
- **Dr. Sheila E. Cohen**, will be awarded the Distinguished Service Award of the Society for Obstetric Anesthesia and Perinatology at the society's Annual Meeting to be held in Florida in May. Dr. Cohen has been a member of the Stanford faculty since 1975 and until recently was Director of Obstetric Anesthesia at LPPH. She is also a past President of the Society for Obstetric Anesthesia and Perinatology and has served on multiple committees in that society and in the American Society of Anesthesiologists.
- At the Annual American Academy of Neurology meeting being held in San Francisco, a number of the members of Neurology received awards or otherwise played a significant role. They are as follows:

- **Gregory Albers**, Professor in Neurology and Neurological Sciences, spoke at the Contemporary Clinical Issues Plenary session.
- **Joyce Liao**, Instructor in Neurology and Neurological Sciences, received the S. Weir Mitchell Award for the outstanding young neurologist-neuroscientist.
- **Larry Steinman**, Professor in Neurology and Neurological Sciences, received the John Distel Prize for multiple sclerosis research.
- **William Mobley**, Professor in Neurology and Neurological Sciences, delivered the George C. Cotzias Award Lecture at the Presidential Plenary session.

Dean's Newsletter

May 17, 2004

The Future of Pediatrics

Most clinical services and specialties in medicine are evolving or changing due to new technologies, innovations, patient expectations, interest of trainees and opportunities for future advances science and healthcare. The care of children, as a specialty, is largely a product of the post-Civil War period. Although special care facilities first arose in England during the 18th Century, they were largely for social care and child welfare, which reached heightened expectations during the Dickensian era. The first children's hospitals were established in the USA in the 1860s and the discipline of pediatrics emerged during the latter portion of the 19th Century. Various models of pediatric care have evolved in the 20th Century and have resulted in striking differences in the roles of the pediatricians in the US vs. the UK. How this field will change in the future is an important question that has implications for how and where care is delivered, whom we train, and what skills will be needed. At the annual Board Retreat for the Lucile Packard Children's Hospital that was held on Tuesday, May 4th, important perspectives were offered on this topic by Dr. Ed Clark, Professor and Chair of Pediatrics at the University of Utah, and Dr. Craig Albanese, who joined Stanford as Professor of Surgery (Pediatrics) and Chief of the Division of Pediatric Surgery at the Lucile Packard Children's Hospital (LPCH) two years ago.

Dr. Clark noted several trends impacting pediatrics – some quite concerning. Among these are that while a number of medical school graduates have entered pediatric training programs, three-quarters or more of whom are women, only 23% are currently pursuing subspecialty training. Considering that only about 10-15% of those who pursue fellowships will ultimately be involved in research, the field of pediatrics is currently – and will increasingly – suffer a workforce shortage. This is particularly pronounced in certain areas (e.g., pediatric neurology, pulmonary medicine, etc) and is already resulting in a shortage of clinical care providers in important pediatric subspecialties. As significant as these clinical shortfalls are and will be, I am equally concerned about the paucity of individuals trained in pediatrics who are pursuing careers in research. If

sustained, we run the risk of having a serious shortfall of individuals trained to do pediatric research at a time when science is bringing forth some of the most exciting opportunities of our lifetimes – and thus, of not having important research opportunities made accessible for children. Obviously this is one area where I believe that Stanford can make an important difference. This is an issue that relates to both the School of Medicine and the Residency and Postdoctoral Training that occurs at LPCH – and argues again for the importance of better aligning medical training through the continuum of undergraduate and graduate education and training.

Another issue Dr. Clark addressed was the position taken by the American Academy of Pediatrics that every child should have a “pediatric home” or, put another way, a pediatrician providing primary or coordinating care. He offered his disagreement with that position and, while I confess a bias, I agree with him, as I have long held that this was neither sensible nor necessary. Indeed, a considerable portion of what is often referred to as primary care pediatricians can be quite successfully delivered by other care providers, including nurse practitioners. This raises the question of what the role of the future pediatrician should be. Given the number of children with chronic medical disorders, it is certainly clear that these children do need a general pediatrician to guide their care. This is not necessarily the focus of current pediatric training programs and yet it is an important area for the future.

Dr. Clark also emphasized the importance of better aligning care within a community to a team of providers. Included in this are pediatric hospitalists and pediatricians who serve as general consultants. Such a team approach is based much more on the UK model than the US model of child health care. This is a model I also agree with but which would require considerable change in the scope and organization of our training programs. It is an area where I also hope Stanford and LPCH can take a lead.

In addition to these changes in pediatric medicine, equally significant changes are occurring in pediatric surgery. Dr. Albanese reviewed some of the exciting results now emerging in what is now referred to as “minimal access surgery.” During the last ten years this approach has revolutionized pediatric surgery and permits even complex procedures to be done with the use of pediatric adapted endoscopes, telescopes and video imaging. The more recent addition of robotics to this field is literally transforming the role of the surgeon as well as the operating room. Indeed, Dr. Albanese described the impact of these changes on the new operating rooms that will be developed at LPCH in the years ahead, which will be notable for their very high tech features, including advanced robotics.

An equally challenging issue for surgery however, is the declining number of medical school graduates entering surgery residency training. In recent years, the selection of residencies has focused as much on programs that enable a more balanced lifestyle as on those that focus solely on the specialty itself. A number of important variables are at play here, including the fact that currently more than half of the graduating class of American medical schools are women (obviously a good thing) but relatively few choose surgery as a profession. This is due to the length of training as well as the schedule and human

burdens involved in general surgery or related surgical specialties. Clearly, considerable reform and modifications are necessary to make these fields of broader interest. Apparently, Stanford has done better than most programs in attracting women to its surgical residency training. While this is important, it is also clear that more fundamental changes will be necessary since this cannot simply be perceived as a gender issue. Again, it is my hope that Stanford will play a leadership role here as well.

It is clear that many changes are unfolding in the care of children. These include a shift to more care being delivered in ambulatory settings, a greater complexity of those admitted to the hospital, an expanding number of children with chronic medical illnesses, (some of whom will carry their disease to adulthood and thus impact the field of general and internal medicine), and a workforce that seems out of synch with where this field needs to go to assure success. The changes that will be necessary are cultural, political and economic and, of course, they are hardly restricted to pediatrics per se. But making them is essential to the future of pediatrics – and medicine.

Importance of Pediatric Research to the NIH: A Different Perspective

I had the opportunity to be in Bethesda on May 5th to help open the expansion to the Children's Inn at the NIH, an event celebrated by Dr. Elias Zerhouni, Director of the NIH as well as Secretary Tommy Thompson, Secretary of HHS and numerous members of Congress and their spouses. This was personally meaningful, since the concept for the Children's Inn at the NIH first emerged more than two decades ago through the initial advocacy of my wife Peggy and me. Over the ensuing years it engaged a large number of NIH health professionals.

Our initial efforts beginning in the early 1980's were quite unsuccessful in convincing the NIH leadership that a facility to house children and families traveling to Bethesda from around the nation - and world - to participate in clinical research protocols was important for their physical and emotional well-being. But we kept speaking on behalf of children and families, many with chronic and life-threatening illnesses. We championed the view that a home-like setting would improve the quality of their care, enhance participation in research and, in a number of important ways, serve as an important symbol to the NIH and its communities that pediatric research and the care of children is important.

Our first breakthrough occurred nearly 17 years ago when one of my patients, a young teenager with a form of Ewing's Sarcoma, turned out to be the babysitter to a Congressman's family. That offered an unexpected opportunity to describe our efforts to establish an inn for children on the NIH campus to this member and his spouse. Suddenly, doors once closed began to open. Over a period of a couple of years a new public-private partnership was forged between our NIH community, Congressional spouses and community leaders. Thanks to a generous gift from the Merck Foundation, the Children's Inn at the NIH was built and opened its doors in 1990.

Since its opening, more than 5,600 children, from all 50 states and nearly 50 countries, have stayed at the Children's Inn while participating in clinical research protocols at the

NIH Clinical Center. This has not only led to a number of important advances in pediatric care and diagnosis, it has heightened the awareness of pediatric research to communities around the world. Indeed, it resulted in more and more children participating in clinical research so that it became necessary to expand the Inn by adding 22 new rooms to its original 37 rooms. This expansion was celebrated on May 6th.

Caring for children and carrying out pediatric research requires more time and resources than that necessary for similar procedures in adults. I am pleased that The Children's Inn at the NIH has helped facilitate these efforts and that it has served as an important symbol to the NIH and the Congress. The Children's Inn and its expanded facility are now located directly across the street from the new NIH Clinical Center. When you are next at the NIH stop by for a visit.

NIH Blue Ribbon Panel on Conflict of Interest

During the past three months you may have noted that my email response message indicated that I was spending a lot of time in Bethesda. The reason was my participation on the NIH Director's Blue Ribbon Panel on Conflict of Interest. This committee was charged to review some major concerns that were first expressed in a LA Times article (December 2003) about perceived infractions of conflicts of interest, especially by high ranking NIH leaders. Our committee was charged to review the NIH policies and procedures on conflict of interest and to make recommendations for their change or improvement – and to do so within 60 days. We completed that task and presented our 109-page report to the NIH Directors Advisory Group on May 6th. The report is available at http://www.nih.gov/about/ethics_COI_panelreport.htm.

Alumni Return to Renew Their Acquaintance with Stanford and Explore Medical Education for the 21st Century

On May 7-8th, the Alumni Association welcomed back Stanford Medical Graduates to renew acquaintances and friendships and to learn more about the current and future Stanford Medicine. While all returning alumni are appreciated, special recognition goes to the Class of 1954, who were celebrating their 50th Reunion. This year's Alumni Weekend featured the annual Senior's Luncheon, the Sterling Ceremony and Dinner and a terrific symposium entitled "Educating Stanford Physicians for the 21st Century and Beyond." In addition there was time for tours, luncheons and, of course, the Class Reunion Dinners.

Of special interest this year was an interactive symposium that helped introduce the New Stanford Curriculum to our alumni visitors. Following an orientation to the New Curriculum by Dr. Ted Sectish, our guests had an "Introduction to Molecular Medicine" by Dr. Gil Chu, Professor of Medicine and Biochemistry, that was modeled after the new – and very popular – course on "The Foundations of Molecular Medicine." They then rotated through five small group interactive teaching sessions that exposed them to various teaching methodologies and techniques. Included were:

1. ***Physician as Knowledge Navigator*** – with Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology.
2. ***Anatomy – A New Approach to an Old Topic*** – with Dr. Larry Mathers, Associate Professor of Pediatrics and of Surgery
3. ***Launching the Future of Medical Education at the CAPE (CAPE) for Advanced Pediatric Education*** – with Dr. Lou Halamek, Associate Professor of Pediatrics
4. ***Demonstration of Small Group Pathology Laboratory*** – with Dr. Don Regula, Associate Professor Pathology
5. ***Learning Technologies in Medical Education*** – with Dr. Parvati Dev, Associate Dean, Learning Technologies Director, SUMMIT

This was followed by an open discussion session that addressed observations, concerns and suggestions of the alumni. It was clear that virtually everyone found the Saturday morning symposium to be an informative and enjoyable experience. The questions focused on how to balance the high tech learning technologies with the important human proficiency knowledge and experience that a physician should have, but which many observe to be increasingly lacking. This includes competence in physical diagnosis and in humanistic interactions with patients. While I described how we are trying to accomplish this in our education programs, it is also clear that these fundamental underpinnings of medical education are areas where we still need improvement. Balancing high technology with high-tech (and not using technology as a surrogate for listening and making human contact with patients) is essential if we are to truly re-engage public trust and confidence in the medical profession.

Report on the Department of Microbiology and Immunology

At the May 7th Executive Committee meeting, Dr. Mark Davis, Chair of the Department of Microbiology and Immunology, provided an overview of its history and current activities. The department was founded in the first years of the twentieth century (circa 1910) by Hans Zinsser, an early and distinguished scholar in the field of microbiology. Today the department consists of 14 faculty with primary appointments and, importantly, roughly an equal number with joint appointments. Indeed, the department is unusual in its number of joint appointments and may serve as a model for the types of interdepartmental and interdisciplinary initiatives the School hopes to foster in the coming years.

The department currently has 54 Ph.D. students, 72 post-doctoral fellows, 48 scientific staff and 15 administrative staff members. Faculty teach a wide range of courses across multiple levels, from freshman seminars on modern plagues and infectious diseases to courses in the medical curriculum and doctoral courses in immunology, virology, pathogenesis of bacteria, viruses, and eukaryotic parasites, and stem cells and gene therapy. The major research themes of the faculty are virology, parasitology, immunology, bacterial pathogenesis and physiology, and mammalian cell biology and differentiation. Dr. Davis briefly described the current research of the departmental faculty.

The Department of Microbiology and Immunology is engaged in exciting research and a broad array of important teaching activities.

California Stem Cells for Research and Cures Initiative

Also at the May 7th Executive Committee meeting, Mr. Ryan Adesnik, Director of Federal Relations, described the activities underway to advocate the passage of the California Stem Cells for Research and Cures Initiative, which will be on the November ballot in California. The initiative is a bond measure that would provide \$3 billion over ten years to fund promising California-based stem cell research. One of the activities he described was an event in Los Angeles on Saturday, May 8th in which Nancy Reagan spoke in support of the initiative. Members of the Executive Committee were encouraged to become informed about the initiative and to participate in it if they wished.

Our New Interdisciplinary Grants Manager will Help You with the NIH Road Map

Finally, at the Executive Committee meeting on May 7th, Dr. Chris Webb, who recently joined the School in the new position of Interdisciplinary Grants Development Manager, described the services he offers. Chris's role is to provide expertise and direct assistance in organizing and assembling large multi-faculty, multi-departmental grant applications. Among the services he provides are the following:

- Scheduling: setting up deadlines and check-points for various steps in the process of writing and assembling a proposal
- Organization and outline: generating an outline and overall organization of a document
- Writing: writing summary material, such as introductions, abstracts, and general overview sections
- Technical editing: making scientific concepts more understandable by a non-expert
- Stylistic editing: improving flow and clarity of the text
- Formatting: ensuring that the document is properly formatted and adheres to guidelines
- Budgeting: helping develop the budget, ensuring that the budget is in rough agreement with the project described in the proposal, helping to write the budget justification

I am very pleased to have Chris in the School, and I encourage faculty who are working on large interdisciplinary grant proposals to contact him at cdwebb@stanford.edu.

Some Notable Events

- ***Memorial Service for Robert WP Cutler***: On May 11th, a Memorial Service celebrating the life of Robert WP Cutler was held in the Stanford Memorial Church. As noted in a prior Newsletter, Dr. Cutler, Professor Emeritus of Neurology and Neurological Sciences died on April 12th. During his tenure at

Stanford, Dr. Cutler was an esteemed and valued faculty member who also served 13 years in the Dean's Office, first in Medical Education and subsequently for Faculty Affairs. Friends and colleagues of Dr. Cutler, including Drs. William Hofmann, James BD Mark, Fernando Mendoza and J. William Dawson, offered words of remembrance. The portrait of a wonderful human being, expert clinician, astute administrator, builder and author, among other many other talents, emerged. He is clearly missed. Dr. Cutler is survived by his wife Maggie, their son Aaron and grandchildren.

- ***HBO Screening Engages Community About the Stanford Cardiovascular Medicine Institute.*** On Friday evening, May 14th, we hosted the premier of a soon- to-be released HBO movie entitled “Something the Lord Made” based on the remarkable lives and contributions of Dr. Alfred Blalock and his lab technician, Vivian Thomas, who pioneered cardiac surgery in the 1940's. This is a remarkable story, and the HBO movie, which will be aired on May 30th, is definitely worth seeing. More than 350 members of the community attended this special event and had the opportunity to not only learn about the pioneering work of Blalock and his collaborators at Johns Hopkins but also to learn more about our new Stanford Institute for Cardiovascular Medicine.

As you know, Stanford also has a rich history of contributions to innovations in cardiovascular surgery, heart transplantation and new diagnostic and therapeutic devices. This positions us well for the new Institute that will be led by Dr. Bobby Robbins, Associate Professor of Cardiothoracic Surgery, who offered a number of examples about areas for future progress. Dr. Robbins also invited the attendees of this very well-received event to return on September 21st for the Mini-Medical School that the Cardiovascular Institute will host to better inform and engage the community in new research and clinical advances. This is part of our overall effort to move and translate knowledge gained in the laboratory more rapidly to the care of adults and children with cardiovascular disorders.

- ***National Center for Space Biological Therapeutics is Launched!*** On Monday, May 10th, a reception was held to celebrate the kick-off of the new Stanford/NASA Ames National Center for Space Biological Technologies – the result of a \$9M funding from NASA. Dr. Greg Kovacs, Associate Professor of Electrical Engineering is the Principal Investigator along with Co-Investigators Dr. Judy Swain, Professor and Chair of the Department of Medicine and Dr. Steve Schendel, Professor of Surgery. This new Center will develop technologies, instruments and systems for physiological monitoring of humans in space and for developing advanced instrumentation for fundamental and applied space biology research. The Center will also promote educational opportunities and will, undoubtedly, engage and produce technologies that will impact human health on earth as well. This is a very exciting opportunity and if you want to learn more about it feel free to get in touch with Drs. Kovacs, Swain or Schendel.

- ***Annual Dinner to Thank Donors to Medical Education.*** On Tuesday, May 11th, we held our annual dinner to thank donors to medical education. This is a wonderful event, and this year's dinner was no exception. The cost for medical education is significant and the average indebtedness of medical students is nearly \$125,000. Thanks to the support of donors and alumni, we are able to provide significant financial aid to Stanford students so that their average indebtedness is \$64,000. Not only does this support enable our graduates to pursue careers that are of the greatest interest to them, it also enables many students to attend medical school who might not otherwise have been able to do so. This is a wonderful gift and I am most thankful to all who have helped make these financial resources available to our students.

The highlight of the so called "financial aid dinner" is commentaries from a small number of students about how coming to Stanford, and of course receiving financial aid, has changed their life. While it is certainly the case that virtually any one of our students could provide a compelling personal story, we heard three representative ones on May 11th – each extraordinary in their own way. I particularly want to thank Leroy Sims (SMS 2), Pamela Mosher (SMS 3) and Richard Cano (SMS 4) for offering very personal glimpses into their lives, including the road they traveled before coming to medical school and how being at Stanford is shaping the course they will follow in the future. The personal stories they provided were compelling and moving to all who attended this wonderful event.

- ***Twenty-First Annual Stanford Medical Student Research Symposium:*** On Thursday, May 6th, the Stanford Medical Student Research Symposium was held. This year's event was dedicated to the memory of Dr. Robert Cutler (see above), who began these annual symposia when he was in the Dean's office some 21 years ago. Thanks to the support of the Alumni Association, this event allows our students to share the results of their research data through poster presentations. This year, 38 students participated in the program and offered a wide array of topics and results. I want to thank Dr. Pat Cross, Associate Dean for Medical Student Research and Scholarship, and Maria Berumen, Symposium Coordinator, along with students Benjamin Berk, Benjamin Hoehn, Eliza Long, Mary-Elizabeth Muchmore, Marie Huong Nguyen and Al Taira, for their work on the symposium. I also want to thank the faculty advisors and research mentors who helped students with their research.

This year's presenters included Antonio Alvarez, Roger Bartolotta, Benjamin Berk, David Berk, Rebecca Berquist, Alyssa Brewer, Joanna Chan, Eric Cornidez, Megan Daly, Jason Davies, Melissa Enriquez, Noah Epstein, Oscar Gonzales, Karen Hirsch, Michael Ho, Wan-Jen Hong, Paul Johnson, Lily Kao, Melissa Ketunuti, Holbrook Kohrt, Andrew Kopelman, Darren Lebl, Cheryl Levin, Dhara MacDermid, Lauren Maeda, Ellen Morrow, Amy Neuder, Rebecca Rakow, William Ryan, Ramin Saketkhoo, Naileshni Singh, Glenn Valenzuela, David Wang, Deborah Williams, Lisa Wong, Joanna Wrede, Gerado Zambrano and

Alenka Zeman. I also want to thank each of these students for taking part in this important research symposium.

- ***Medical Student Panel on “Universal Healthcare: Options for Change.”*** On Wednesday evening, May 12th, an excellent panel debate was organized by first year medical students as part of the health policy component of the Practice of Medicine course. The symposium featured a panel debate by three authorities representing different point of views. Dr. Don Barr, Associate Professor in the Department of Sociology served as the moderator; the panelists included Dr. Victor Fuchs, the Henry J Kaiser, Jr. Professor Emeritus, Dr. Anmol S. Mahal, Chair of the Board of Trustees of the California Medical Association and Dr. Don McCanne, President of the Physicians for a National Health Program. Each presented their specific points of view or recommendations and then responded to questions generated by the students. It was a very thoughtful dialogue and I commend the students for organizing this event. Special thanks to first year students Erik Cabral, Christle Layton, Lori Rutman, Ryan Williams and Joanna Wrede.
- ***Stepping Up: Actions to Improve Asian American and Pacific Islander Health:*** On Saturday, May 8th, the Asian Pacific American Medical Student Association held its 2004 Western Regional Conference at Stanford to provide the university community with suggestions and options “to get involved and take action to improve the health of Asian and Pacific Islanders both now and as health care providers in the future.” The all day event featured presentations, workshops and networking opportunities. A truly excellent program was presented. Special thanks go to the Conference co-chairs Bory Kea and Jolene Nakao.
- ***Medicine and the Muse:*** On Thursday, May 13th, the School was privileged to host Medicine and the Muse, an Arts, Humanities and Medicine Symposium. This event was supported by generous grants from Helen and Peter Bing, The Osher Foundation, and The Vera M. Wall Center at Stanford. It was sponsored by the Biomedical Ethics and Medical Humanities Scholarly Concentration and the Stanford Center for Biomedical Ethics. The keynote speaker was Dr. Rafael Campo, author of *The Healing Art: a Doctor's Black Bag of Poetry*. Sarah Bain moderated the event. Michelle Rhee, Joshua Spanogle, Elise H. Lawson, and Sarah Hilgenberg presented their Arts and Humanities Medical Scholars projects. Matt Bucknor and John Nguyen each sang and played original guitar compositions; Nguyen was accompanied by Merritt Schader on the xylophone. Bryan Maxwell, Sarah Langley and Cheri Blauwet read their creative writing. Sheri Chevez, Sharon Kwan, Sarah Ratanasopa and Tracy So displayed their work in the visual arts exhibit. The audience was visibly moved and impressed by the depth of talent and dedication displayed by these students. Thanks to everyone involved in making this symposium such a successful and meaningful event.
- **Dedication of the Vera Moulton Wall Laboratory for Pulmonary Vascular Research:** On Thursday, May 13th, the dedication of the Vera Moulton Wall

Pulmonary Vascular Research Laboratory was held in the courtyard of the Center for Clinical Sciences Research (CCSR). The Laboratory, which is run by Dr. Marlene Rabinovitch, the Dwight and Vera Dunlieve Professor of Pediatrics, is part of the Wall Center. This was named two years ago in honor of the grandmother of a pediatric patient with pulmonary hypertension who was treated at the Lucile Packard Children's Hospital. The mission of the Wall Center is to heighten awareness about pulmonary vascular disease, to serve as a resource center, to provide education to students and postgraduate trainees, to offer clinical care and to conduct research that improves the understanding and treatment of these disorders. Dr. Rabinovitch is the Director or Research for the Wall Center and Drs. Jeff Feinstein and Ramona Doyle serve respectively as the Director and Co-Directors of the Center.

Announcements

- **Dr. Ron Levy**, Robert K. and Helen K. Summy Professor and Chief of the Division of Oncology in the Department of Medicine, will be featured in a special celebration honoring his accomplishments (see also below) in cancer research in a featured broadcast on the Discovery Health Channel on July 8th.
- **Dr. David Gaba**, Professor of Anesthesia, has been named to a new position as the Associate Dean for Immersive and Simulation-Based Learning, effective July 1st. In this role he will have the responsibility of defining how the School should use immersive and simulation-based technologies to support our clinical, research and educational missions. This will include coordinating the extant programs at the VA Hospital, Department of Surgery, Department of Pediatrics, and SUMMIT that are already contributing to these important efforts and especially working with them on how they will relate to our new learning and knowledge center. This position will be under the aegis of Information Resources and Technology.
- Stanford University students will be joining more than 100 other peer colleges and universities for a 24-hour Dance Marathon to raise money to support the activities of the Elizabeth Glaser Pediatric AIDS Foundation and especially the important work being performed to reduce the transmission of HIV in developing nations. If you are interested in making a contribution to this cause (or participating in the Dance Marathon) contact Vinesh.Patel@Stanford.edu.

Awards and Honors

- **Dr. Matt Scott** has been named the recipient of the 2004 Edwin G. Conklin Medal in Developmental Biology in recognition of his outstanding research as well as mentoring. Dr. Scott will deliver the Conklin Lecture and receive his award at the Society of Developmental Biology Meeting in July. Congratulations to Matt!
- **Dr. Ron Levy**, the Robert K. and Helen K. Summy Professor and Chief of the Division of Oncology in the Department of Medicine, was the recipient of this year's JE Wallace Sterling Lifetime Alumni Achievement Award in recognition

of his groundbreaking work in cancer immunotherapy and cancer vaccines. He received the award at the Alumni Dinner on Friday, May 10th, with special accountings and accolades from his long-time colleagues Saul Rosenberg and Karl Blume. Congratulations to Ron.

Appointments and Promotions

- **Amar Das** was appointed to Assistant Professor of Medicine (Medical Informatics) and of Psychiatry and Behavioral Sciences, effective 5/1/2004 to 4/30/2007.

Dean's Newsletter **May 31, 2004**

Enhancing Diversity in the School of Medicine: A Now and Future Issue

Among the highest priorities I have for the School of Medicine during the next several years is further enhancing the diversity of our students, faculty and staff. The May 21st Executive Committee Meeting was the start of what I hope will be a series of discussions about diversity and inclusiveness of underrepresented minority students at the School of Medicine. Scott Bass, Visiting Professor in the School of Medicine from the University of Maryland, Baltimore County (UMBC), presented information about that institution's success in attracting and retaining diverse undergraduate and graduate students. We have been fortunate in having Dr. Bass visiting with us during the past six months since he and his colleagues at UMBC have made considerable progress in enhancing student diversity at that institution. We felt that we each had something to learn from the other's experience and interests – and that has proven to be the case.

One of the major factors contributing to the success of the UMBC program is its President, Dr. Freeman Hrabrowski. We had the opportunity to benefit from President Hrabrowski's vision and experience when he delivered our first Seminar on Graduate Student Diversity on December 6, 2002. President Hrabrowski is also the dynamic African-American mathematician who helped establish the Meyerhoff Program at UMBC, whose well-prepared students have been so successful at Stanford and in other top tier M.D. and Ph.D. programs. Dr. Bass is the Vice Provost for Research and Dean of the Graduate School at UMBC and has helped expand the Meyerhoff Program to the graduate level.

Dr. Bass pointed out that production nationally of Ph.D.s from underrepresented minority groups in the science and engineering fields remains very small. In fact, in 2002, there were only 122 African Americans who received Ph.D.s in Biology out of the 5,680 degrees awarded (2.15%) in the United States. While figures for Latinos and Hispanics were slightly higher, with 178 degrees awarded (3.13%), the numbers and percentages across the sciences remain very low. This situation is equally dismal for other under-

represented minorities, including American Indians, who had 12 Ph.D.s in the Biological Sciences throughout the USA, reflecting (0.21%) of the degrees awarded. As a consequence of these dismal numbers, the pool of available minority faculty and researchers remains very small. This will have long-range implications, particularly for institutions like Stanford.

On a more positive note, UMBC has found that large numbers of talented minority students express interest in the sciences and engineering, but too few are retained over the course of their undergraduate years. This makes recruitment a challenging experience for graduate programs. Nevertheless, the Meyerhoff Program at UMBC has produced 332 primarily minority graduates, 70% of whom enrolled in graduate and/or professional programs (some have graduated). As of May 2003, 104 are enrolled in Ph.D. programs, 47 in M.D. programs, 24 in MD/PhD. programs, and one each in MD/JD, MD/MPH, and DDS programs; still others are enrolled in Masters level programs. These students have not only entered challenging graduate and professional programs, but they are doing very well at some of the nation's best universities, including Stanford. We currently have four graduate students from the Meyerhoff Program in the School of Medicine and in the School of Engineering.

Dr. Bass pointed out that while diversity efforts at the undergraduate level have met with success at UMBC, the same had not been true at the graduate level. Over a several year period, faculty and administrators sought to reverse this outcome and so adapted many of the practices at the graduate level that had proven successful for undergraduates. The result of their efforts is a dramatically different graduate student profile, particularly in the Biomedical Sciences. And, in 2002, UMBC was awarded the Council of Graduate Schools/Peterson's Award for Innovation in Promoting an Inclusive Graduate Community.

Among the key elements to success, Dr. Bass noted, is faculty ownership of a program of prestige for talented minority students. Faculty involvement in recruiting, mentoring, and supporting underrepresented minority students is the most important single ingredient to success in such an effort. Other important components include a ten-week summer bridge program before the start of graduate study, social activities for minority students across departmental lines, peer support, funding to attend predominantly minority research conferences, resources to host minority speakers on campus, staff support for these students, and structured activities for the students on campus. The goal is not only to attract these talented students to campus, but also to have them feel that the campus is their home and that they belong. Indeed, Dr. Bass cited the impact of these key factors in changing institutional culture and improving diversity by noting the changes that have occurred not only at UMBC but also at Georgia Tech.

Accordingly, Dr. Bass argued that these elements of success are transferable across institutions and that several other universities that had set diversity and inclusiveness as priorities have evidenced change. Although we have a long way to go, progress is happening at Stanford. Fortunately we have a long history of minority student development and recruitment to our medical school classes – which are now among the

most diverse in the nation. During the past couple of years we have made progress in recruiting under-represented thanks to the efforts of Ms. Kimberly Griffin, who joined us two years ago as the Director of the Biosciences Diversity Program/Assistant Dean for Graduate Education. Her efforts are leading to tangible results. I want to thank her as well as her colleagues Dr. Ellen Porzig, Dr. John Boothroyd and also Dr. James Nelson for helping to launch this program. A copy of Dr. Bass' presentation is available at [HTML](#) | [Flash](#).

While the progress made in enhancing medical and graduate student education is important and encouraging, we also have considerable work to do in recruiting and retaining minority faculty and staff. This will be a major initiative and I will be following up on this discussion throughout the year. Indeed, it will feature prominently in our Leadership Retreat next January as well as in a new program in leadership development within the School. It will also oversight from the Office of the Dean to help make sure that we are doing all we can to enhance and improve diversity within the School of Medicine.

Provost's Report on Women at Stanford – and a View from the School of Medicine

At the University Faculty Senate meeting on May 27, Professor of Law Deborah Rhode, presented the results of a three-year study of the status of women faculty. The study was done by an advisory committee appointed by President Hennessy and Provost Etchemendy in 2001. The committee's work encompassed three areas: recruitment and retention practices; compensation, resources, and recognition; and the quality of life for Stanford faculty. Extensive data were collected in all of these areas and the results carefully analyzed to see whether there were differences between the experiences of men and women faculty.

The results of these studies were mixed and complicated, both for the University as a whole and for the School of Medicine. The committee concluded that, over the past quarter of a century, Stanford University has made substantial progress in increasing the representation of women in faculty and leadership positions, and in improving the climate for women on campus. For instance, in the School of Medicine, seven out of 27 department chairs – or 26 percent - are women, the highest percentage among our peer schools.

However, challenges remain. For the School of Medicine, the report pointed particularly to differences in the quality of life reported by men and women faculty, especially in the clinical departments, where women were less satisfied than men along several dimensions. We will be following up on these results to understand at a deeper level the issues facing women faculty and possible improvements we can make.

Our efforts in this important area will carry on work begun three years ago when I first came to Stanford. At that time, we created a committee under the leadership of Professor Mary Lake Polan to look at the needs of women faculty. The committee surveyed 163 women who said they wanted more flexibility, including part-time appointments, the

opportunity for short-term sabbaticals, career mentoring, administrative support for grant preparation and expanded childcare options. We have been working to implement these recommendations. More recently, Senior Associate Dean for Academic Affairs David Stevenson has been developing a set of programmatic initiatives for faculty development that will address these concerns as well. I will have more to say about these initiatives in the near future.

During this time we have also put considerable effort into striving to achieve a “Respectful Workplace” in order to overcome some of the very negative challenges and issues that existed within the School just years ago. An important part of this has been to have a zero tolerance policy for sexual harassment or other forms of poor citizenship. While some of these matters can also be complex, we have acted aggressively to deal with each issue that has arisen and in many cases we have brought swift resolution. We have also instituted mandatory workshops for all of our departments on the “respectful workplace” in order to heighten awareness and attention to this most important matter. I want to thank those who have played a key role in coordinating these respectful workplace workshops, including Dr. David Stevenson, Cori Bossenberry, Ellen Waxman, Martha McKee, Roy King, Melissa Burke, Greta Schnitzler, Norma Leavitt and Tom Fenner. We will continue to make this a high priority in the future as well.

It is also important to note that both men and women faculty with clinical or basic science careers, here at Stanford and nationally, are under great pressure to keep up with demands of caring for patients, as well as teaching and conducting research. Women, and especially single mothers, have the added burden of family responsibilities. We not only want to be an environment that attracts great talent, we want to ensure that Stanford has an environment that allows women to succeed and excel. We will need to explore other creative solutions to making our community more successful and balanced, including greater flexibility in schedules, more part-time appointments and a reassessment of the promotion process in order to better achieve better work-family balance.

I would like to thank Professor Rhode and the Provost’s Advisory Committee on the Status of Women Faculty for their report. They have brought to our attention challenges we need – and want - to address. The report is broadly informative and specifically helpful and will be of great assistance in our further inquiry and action. The report is available online at <http://www.stanford.edu/dept/provost/womenfacultyreport>. I encourage everyone to read it carefully, and I welcome any comments you might have about it.

School of Medicine and University Commencement Exercises

Commencement is right around the corner. The University commencement will be held on Sunday June 13th and the School of Medicine will hold its diploma ceremony on Saturday, June 12th beginning at 2:00 p.m. The faculty procession is to line up at 1:30 p.m. in the Dean’s Courtyard. We look forward to this wonderful celebration with our graduates, their families and friends as well as with our faculty and staff. Our School of Medicine Commencement Speaker this year will be Paul Michael Glaser, actor, director,

parent and advocate for the health of children and families, especially those with HIV and AIDS. I have known Paul Glaser and his family for more than 15 years and am certain that his presentation will be a moving and compelling message. I look forward to seeing you on June 12th. I also encourage our graduates to attend the University Commencement Exercise on Sunday June 13th when Supreme Court Justice Sandra Day O'Connor will be speaking.

Practice of Medicine Student Presentations and Advocacy

Students in the Practice of Medicine Course have been quite busy in recent weeks presenting the results of their research efforts on important public health and policy themes or in hosting important debates or discussions. Dr. Clarence Braddock, Course Director, has played an important role in leading this effort. But the greatest thanks must go to our students, who have done splendid jobs in working on a diverse array of important topics. On May 17th both platform and poster presentations demonstrated the fruits of their labors under the banner of "Students Making an Impact". Among the important topics different groups of students addressed were:

- **Care vs. Cure: Physicians and the Disability of Spinal Cord Injury**
- **Availability of Organs for Transplantation: Increasing the Registered Donor Pool**
- **Importing Prescription Drugs from Canada: Social, Economic and Legal Issues.** This focus group was also the basis for a debate forum that was held on Monday evening May 24th featuring **Dr. Laurence Baker**, Associate Professor of Health Research and Policy, **Dr. Terry Blaschke**, Professor of Medicine and Past Chair of the Generic Drugs Advisory Committee for the FDA, **Dr. Linda Giudice**, Professor of Obstetrics & Gynecology and Chair of the FDA Advisory Committee on Reproductive Health Drugs, **Dr. David Gollaher**, President and CEO of the California Healthcare Institute, and **John Barron**, Professor of Law Emeritus and Past Chair of the UK Intellectual Property Rights Commission.
- **Expanding Stem Cell Funding**
- **Reclassifying Obesity as a Disease: Policy Implications**
- **The ESRD Prevention Plan**
- **Advocating a Modified Health Plan of Med-Cal**
- **Addressing Obesity by Reducing Fast Food in Schools**
- **Expansion of County Program to Cover Uninsured Children**
- **Medicare Reform: Increasing Public Awareness and Participation**

- **Safety and Health in the Semiconductor Industry: Environmental Toxins**
- **Voices of the Uninsured in Santa Clara County**
- **Making the Case of Regulation of Dietary Supplements**
- **Cheap Food, Hefty Costs. Agricultural Policy as on Obesity-Related Public Health Issue**
- **Expanded Screening for the Newborns of California**
- **Supporting the Safety Net**
- **What would you say: Designing an End of Life Care Curriculum for Stanford Medical Students**
- **Medical Students for Scientific Integrity**
- **The Spirit Catches You and You Figure out a Solution for Improving Current Translator Services via a Digital Video-Conferencing Network**
- **Universal Health Care: Options of Change** – which was also the topic of a forum that I covered in the May 17th Dean's Newsletter

I am pleased and impressed by the range of topics that our students addressed and hope that their work not was educational to themselves and their colleagues but that it also inspired them to become more active in attempting to address more publicly some of these important topics and issues.

Recognizing New Endowed Chair Holders and Namesakes

Bestowing an endowed chair on a faculty member is one of the greatest honors that a university can offer. On Tuesday, evening May 18th, we held a special reception in the Cantor Art Museum to honor faculty who have become the recipients of an endowed chair during the past year. Those honored and the chair they now occupy included:

- **Dr. Stanley Falkow, the *Robert W. and Vivian K. Professor***
- **Dr. Robert K. Jackler, the *Edward C. and Amy H. Sewall Professor***
- **Dr. Roger D. Kornberg, the *Mrs. George A. Winzer Professor***
- **Dr. Frederic B. Kraemer, the *Stanford University Professor in Endocrinology***
- **Dr. Richard M. Myers, the *Stanford W. Ascherman MD, FACS, Professor***
- **Dr. Samuel K.S .So, the *Lui Hac Minh Professor***
- **Dr. Lucy S. Tompkins, the *Lucy Becker Professor***

In addition, we also held an event on Thursday, May 20th, in the Faculty Club to honor both the new recipient of an endowed chair and the faculty person in whose honor it has been named. The new endowed chair is the Philip Sunshine Professorship in Neonatology named to honor an individual who helped found the field of neonatology and who has been an esteemed leader and faculty member at Stanford for over forty years. The first incumbent of the ***Philip Sunshine Professorship*** is **Dr. William E. Benitz**, a member of the faculty since 1985 and both friend and colleague of Phil Sunshine. Needless to say this was a wonderful celebration.

Finally, the Department of Pathology has recently created the ***Richard L Kempson MD Professorship in Surgical Pathology*** to honor Dr. Richard Kempson, who has been a pioneer and leader at Stanford for over three decades. A special event to honor Dr. Kempson will be held in the fall of 2004.

I want to congratulate each of our new chair holders or namesakes and offer my thanks and appreciation to the donors or departments that helped to make these professorships possible.

Honoring Our Teachers and Educators

As a School of Medicine, with missions in education, research and patient care it should go without saying that the education and training of our students, residents, fellows and faculty stands at our highest priorities. Indeed, one of the primary reasons physicians and scientists want to be part of a medical school is the opportunity to teach, learn and interact with students and colleagues. While education should be ingrained in our culture, it is also challenged in many academic medical centers, including Stanford, by the fiscal demands placed on faculty – particularly clinical faculty. While it is our ultimate hope to raise the funds to help offset the cost of teaching, we wanted to take the opportunity now to thank our teachers for their time, commitment and dedication.

Accordingly, on Tuesday, May 25th, Dr. Julie Parsonnet, Senior Associate Dean for Medical Education, and I hosted a reception to honor and thank faculty who have contributed so much to our teaching mission. While some of these faculty will be recognized with awards at graduation, each have made substantial contributions and we wanted to thank them all.

Let me take the opportunity, once again, to thank all of our dedicated and committed teachers.

Another Mini-Medical School Course: Turning Scientific Insights into Advanced Cancer Care

During the past two years we have held a number of “mini-medical school courses” to educate our community and engage them as supporters of the School of Medicine and Medical Center. On Thursday evening, May 27th, I was joined by Mike Peterson, Chief Operating Officer at SHC, representing Martha Marsh, CEO (who had an unavoidable

conflict) in welcoming more than 100 guests to a series of lectures and discussion groups on topics in cancer and stem cell biology. As with prior events, it was very well received.

The program consisted of a plenary lecture that was given by **Dr. Sam Gambir**, Director of Molecular Imaging and Professor of Radiology, on ***“When Cancer Has Nowhere to Hide”***. Dr. Gambir discussed some of the exciting insights and developments emerging from the research he and his colleagues are performing using molecular detectors to locate and identify tumor cells – ideally well before they could be found on more conventional imaging equipment. His work will lead to more personalized early diagnostic efforts and interventions and will surely play an important role in shaping the future of cancer treatment and prevention.

In addition, the participants had the opportunity to choose two small seminar/discussion groups from a palate of six exciting and diverse areas. Included were:

1. ***Early Detection and Innovative Treatment of Breast Cancer*** – with Dr. Robert Carlson, Professor of Medicine and Debra Ikeda, Associate Professor of Radiology
2. ***Improved Techniques and Technologies for Prostate Cancer*** – with Dr. Joe Presti, Associate Professor of Urology
3. ***Assessing Genetic Risk for Cancer*** – with Dr. James Ford, Assistant Professor Medicine and Genetics
4. ***Advances in Detecting and Treating Gastrointestinal Cancer*** – with Dr. George Fisher
5. ***Improving Therapeutic Outcomes for Lymphoma*** – with Dr. Sandra Horning, Professor of Medicine
6. ***Cancer and Stem Cell Science*** – with Dr. Irv Weissman, Professor of Pathology and Director of the Institute for Cancer/Stem Cell Biology and Medicine.

The program was excellent and very well received. I want to thank each of our faculty members for the time they spent preparing and delivering their presentations. I also want to thank the Office of Medical Development for making the arrangements that made this mini-medical school course so successful.

Honors and Awards

- ***Dr. Norman E. Shumway*** was honored by faculty and trainees from around the world on May 22nd on the occasion of the unveiling of a portrait and bust in his image. Without question, Dr. Shumway is a living legend, having pioneered numerous aspects of the current specialty of cardiovascular surgery. Equally importantly, he trained a cadre of leaders who direct and guide programs

throughout the USA and the world. His remarkable career was also reviewed in a celebratory festschrift in the Clark Center Auditorium by two of his distinguished former colleagues and trainees: Dr. Vincent Gott, Professor of Surgery at Johns Hopkins University School of Medicine, and Dr. William Brody, President of Johns Hopkins University. Dr. Bruce Reitz, Professor and Chair of Cardiothoracic Surgery at Stanford, served as host. It was a great event filled with an appropriate balance of respect, humor, reverence and irreverence that displayed the remarkable life and career of Dr. Norm Shumway.

- **Dr. Emmet B. Keefe**, Professor of Medicine, has become the 99th president of the American Gastroenterological Association (AGA) and will serve for one year. Founded in 1897, the AGA is the oldest medical specialty society in the United States and currently has more than 14,000 members.

Appointments and Promotions

- **Scott Atlas** has been reappointed to Professor of Radiology at the Stanford University Medical Center, effective 5/1/2004.
- **Anne Brunet** has been appointed to Assistant Professor of Genetics, effective 6/1/2004 to 5/31/2007.
- **Magali Fontaine** has been appointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 5/1/2004 to 4/30/2007.
- **Neeraja Kambham** has been appointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 5/1/2004 to 4/30/2007.
- **Bruce Patterson** has been appointed to Associate Professor of Pathology and Medicine (Infectious Diseases) at the Stanford University Medical Center, effective 5/1/2004 to 4/30/2009.
- **Julien Sage** has been appointed to Assistant Professor of Pediatrics and of Genetics, effective 6/1/2004 to 5/31/2007.
- **Uma Sundram** has been appointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 5/1/2004 to 4/30/2007.
- **James Zehnder** has been reappointed to Associate Professor of Pathology and Associate Professor, by courtesy, of Medicine (Hematology) at the Stanford University Medical Center, effective 2/1/2005 to 1/31/2010.

Dean's Newsletter June 14, 2004

During the summer months the Dean's Newsletter will depart from its every other week schedule to a more irregular reporting schedule. Regular biweekly issues will resume after Labor Day.

Commencement

On Saturday, June 12th, the School of Medicine held its celebration and diploma awarding event on the Dean's Lawn. The University Commencement Ceremony, was held on Sunday morning, June 13th. This year, the School presented 23 Master of Science degrees, 70 Doctor of Philosophy degrees and 90 Doctor of Medicine degrees.

Please join me in extending our personal congratulations to each and every graduate and to their parents, families and friends. What a wonderful accomplishment by all.

I would also like to take this opportunity to especially thank Char Hamada, Zera Murphy and others in Student Affairs for all of their painstaking efforts that made this year's commencement a tremendous success. Also thanks to Sharon Olsen, Lorena Najarro, JoAnne Berridge, Robin Casey, Nancy Cubit, Ann Davis, Kathy Fitzgerald, Peter Gallo, Doug Monica, Velessa Peairs, Cassandra Sooter, and Rebecca Wyse for helping to set up Saturday's great event. Raag Airan and Kevin Wei (both first year med students, about to become second year medical students) volunteered their time on Saturday to carry the flags.

Address to the Graduates

One of the traditions of the School of Medicine Commencement is a presentation by an elected member of the Graduate and Medical Student graduating class. This year, Cris Niell, Ph.D., a Candidate in the Neurosciences Program, and Kristin Clague Reihman of the 2004 graduation class in Medicine, spoke to the graduates and guests. They each gave compelling and inspiring remarks.

PhD Student Speaker, Cris Niell, PhD Candidate in the Neurosciences Program

I'd like to thank you for the opportunity to speak this afternoon. When I first found out I had been selected, I had no idea what I ought to say. Usually a graduation speaker is expected to give some type of sage advice – unfortunately, I'm not sure people would take advice from a grad student, particularly when there are much more sagacious people up here behind me now. I'm probably also supposed to be entertaining, but since my sense of humor generally consists of a string of obscure Simpsons and Big Lebowski quotes, I'll try to suppress that.

I did start thinking about what kind of unique perspective I might have to offer. I was at Stanford for undergrad as well, which means I arrived here on the Farm 13 years ago – so I guess I can offer the perspective of someone who has been here far too long. However, I did take off three years in between undergrad and starting grad school, and a lot changed in between. When I came back, suddenly I was one of those “sketchy” grad students, speeding around campus with my bike helmet on and lurking in the coffee house.

But one of the biggest changes – this was 1998 when I came back to Stanford – was the whole dot-com thing. When we graduated, many of my friends went to work at little companies like yahoo or paypal and a lot of them were doing really well for 25-year olds. In fact, I have several friends who are still “retired” as a result of their success back then. So while my friends were living in nice places, buying new cars, and had plenty of disposable income, I was trying to live off a stipend that was half the definition of poverty level for the bay area, and living with three people in a “stuffed” double in luxurious Escondido Village.

Of course, within a couple of years it turned out that my decision wasn’t so misguided financially speaking. However, I think all of us in grad school ask ourselves why we willingly choose the life of a student. After completing 22nd grade, I’m making less money than in summer jobs during high school, and I’m still living in a dorm a quarter mile from where I lived freshman year.

The simple answer to why we came to grad school is that we like science. However, grad school is definitely not the fastest way if you want to learn things about science – you can learn a lot more reading a book about science than actually doing research.. In research, you do learn things about how the world works – you just learn them a little dribble at a time. The difference, though, is that you’re learning things that nobody knew before. This is the beauty of research, and probably the thing that pulls all of us in, the ability to learn new things and make discoveries. I can look back over the past few years and think of several of those “aha” moments, when all of a sudden you understand how things work. One night, I was in lab late looking at a bunch of timelapse movies of neurons growing and forming connections, and I noticed there was a particular pattern to how they were growing. Of course, it took a lot of further work to back up this insight, but I think those moments of discovery are really what science is about.

Another great benefit of research, and grad school in particular, is the freedom that you have, both in terms of your schedule - you can come in late, you can take off in the middle of the week to go snowboarding – but also intellectually, in that you get to choose the problem that is interesting to you, and figure out how you want to go about answering it. And for the most part, there’s not a real constraint on what you choose – it doesn’t have to make money for someone, or appeal to the 18-35 age demographic. You get to spend your time trying to answer the question that fascinates you.

The tough part about grad school is that it turns out that both of these great aspects – the thrill of discovery, and the freedom – are double-edged swords. While it’s a great feeling when your experiments work and you’re discovering new things, most of the time, you’re doing something much more banal, like pipeting clear liquids back and forth, or cleaning fish tanks. A lot of time things aren’t working at all and you feel like you’re banging your head against a wall. Or even worse, you can make negative progress – one wrong move and you’ve undone several weeks worth of work. In fact, I think the intermittent rate of success - like Homer Simpson said, “the dizzying highs, the terrifying lows, the creamy middles” - is part of what makes research so addictive, yet so painful at times. It’s like a study that was done on rats – when they press a little lever, they get some food or other

reward. If they get the reward every time, they'll just press the lever every once in a while, when they're hungry. If they never get anything for pressing the bar, they give up pretty quickly. However, if they only get the reward every once in a while, they press the bar like mad, because they never know when it's going to work. It's pretty easy to get caught up like this in research. Those times when everything comes together and you get real results are intermittent – if the experiment was easy, someone would have done it already - so you can drive yourself crazy in the quest for that occasional breakthrough.

The other aspect – the freedom and autonomy - also has its liability. The fact that you're working for your own benefit means that if you take vacation for a week or spend all day surfing the web, there's no Principal Rooney to hunt you down, it just means you're going to be here a week longer. Likewise for the intellectual freedom – if you choose the wrong experiments to do, it's your fault – rather than the company making 1% less profit, you don't get the answer to your question, and you start to get that sinking feeling that you're never going to graduate.

These kind of gumption traps, as Robert Pirsig calls them, can be fairly demoralizing at times, and I think they're part of what leads to the familiar “bitter grad student” phenomenon. One solution to this, the Lebowski answer, is that sometimes you just have to let it go – “forget it, let's go bowling” – and realize that you can't always be struggling for that light at the end of the tunnel.

But the real thing is realizing that we're here doing what we want to do. When I was a kid, if somebody told me I would get to play with computers and lasers and build microscopes, figuring out how the brain works, it would seem like a dream job. And if I had some other job now, this would probably be my hobby. However, once you have to do it, and graduation and progress in life depends on it, it's easy to forget that this is actually what you wanted to do in the first place. For the past few years, although we've been paid a pittance, living the student life that most of our friends left behind in college, sitting around trying to figure out why the laser isn't lasing or your PCR didn't work, we've been given the chance to make our hobby into our life, and hopefully along the way we've been able to figure out something new about how living things work.

I'd like to thank all of you for allowing me to get up here and blather on. Good luck with all the future endeavors!

MD Student Speaker, Kristin Clague Reihman

It is an incredible honor to be speaking to you all today, and I thank you for the opportunity to do so. A month ago, I moved to Pennsylvania for residency and the first thing I did there was to take up yoga. You may wonder why I waited until I *left* California to cultivate my inner yogi. Maybe it was the fact that I was traveling East. Perhaps it's been my effort to extend my California membership, in absentia, just a little bit longer. At any rate, I find I am really liking Yoga—maybe because it reminds me so much of medical school. In yoga, much like in med school, you often find yourself feeling hopelessly underprepared for the challenging positions you are asked to assume,

and feeling that everyone else around you could probably teach the class. And every practice includes the greeting “namaste,” which roughly translated means “the goodness in me sees the goodness in you.” I know, not exactly what you heard every day on morning rounds—so the analogy somewhat breaks down here. But still, I think there is a comparison to be made, because I am learning that all I really needed to know about balance, strength, and flexibility I’d already learned...at Stanford Medical School.

Ah, the “hidden curriculum.”

Throughout medical training, much attention is paid by medical students to strength, in particular as it relates to the concept of being a “strong medical student.” Feyza Marouf’s moving speech last year focused on this very subject. And whether we buy into it or not, strive to achieve it or not, we all know who gets labeled “strong” and who doesn’t. And balance is not, according to the prevailing definition, part of being a strong medical student. One of the required reads for one of the harder clinical rotations, a book called *Surgical Recall*, gives some ludicrous description of the “strong” medical student as a “high speed, low drag, hardcore hammerhead.... with a steel bladder, a cast iron stomach and a heart of gold.” I recall reading that just before the rotation started, and immediately needing to both eat, and pee. But even as this description is laughable, it remains part of a set of tacit expectations that seem to offer us the “permission to abandon ourselves,” as Barry Rosen has so aptly put it. Not heeding them can have equally disastrous results: a friend of mine learned this the hard way, when she failed to pass her medicine rotation solely because she “did not abuse herself enough.”

So I would like to offer a counter-definition of “strength.” Later in my surgery rotation I witnessed a conversation between an attending and a second year resident, who I knew was 4 months into awaiting the birth of his first child. He had not spoken much of this momentous event to come, but at some point in the five hour surgery, wry, pithy comments gave way to easy conversation and my resident asked our attending: “So, you have kids, right? How do you find the time to, well, uh...” and at this point he trailed off, apparently uncomfortable with the direction he was going. I understood. In my experience, the topic of family was always a loaded one in the surgical suite. As the chief of surgery at Kaiser pointed out to me, “you’re never gonna lie on your death bed wishing you’d done just one more Whipple procedure.” And everyone claims to agree with this, yet, for many, it seems so difficult a thing to do less for your career, and more for everything else you care about. This is, of course, one of the inherent dangers of our chosen profession, as I’m sure you’ve noticed. Anyway, the resident started up again with: “...well, I mean, do you ever feel like you’re not advancing in your career the way you could without a family?” We all grew uncomfortably quiet and awaited the response. “Well,” our attending began, “I passed up a promotion to Chief of Surgery in arguably the finest surgical institution in the country because my eldest daughter said, ‘Forget it, Dad, we’d never see you again.’” We all laughed tensely, but he continued. “No, I’m serious. Imagine the most interesting and challenging case you could ever possibly do. I would take pushing my kid on the swing over that any day. *Any day.*” This man’s willingness—and strength—to speak his own, personal truth, and to be an example of balance for this budding surgeon and new father, touched me deeply.

As for flexibility, we have spent the past several years in something akin to the lotus position. This training has placed enormous demands, not just on our intellect, but also on our integrity, our physical selves, our personal lives. Like many of you, I chose Stanford for medical school because it offered a flexible curriculum unique among medical schools. The possibility of a 5, or 6, or even 10 year plan was something I felt could help me to meet the anticipated demands with as much personal strength, balance, and clarity of purpose possible. I wanted to start a family, maintain a close relationship to my husband, develop my teaching skills, and get in an occasional swim--all while becoming a doctor. Thanks to a flexible curriculum and supportive community, I was able to accomplish those things. The rest of you made use of Stanford's culture of personally-directed achievement in a multitude of ways, pursuing an impressive array of interests to a variety of depths and degrees. Several of you engaged in research, writing papers that ended up in *Nature* and *Science* and *Cell*. Others made films and published books documenting the extraordinary process of becoming a physician, or trained athletically, fulfilling life-long dreams to compete at local, national and international events. Some of you worked to bring us new electives, and speakers in under-represented topics, or to guide us through the morass presented by too many of our pre-clinical courses. A few even started special-interest groups when there was a need, and sat in on CCC meetings trying to effect positive change in our curriculum. Some of you did extra coursework in subjects that were of interest, such as poetry, Spanish, wind-surfing and advanced-level genetics--some even obtaining advanced degrees, in law, anthropology, public health, in the humanities, in business, in the sciences. A few of you tended gardens, had babies (or baby-sat mine), played instruments, or published first novels. Some traveled to far-off lands to study other cultures, languages, systems of healing, or to provide consulting and resources to less privileged areas, building partnerships and sustainable solutions to endemic problems. Others sought to effect social change closer to home, in East Palo Alto, teaching elementary students about science and painting murals with middle school students, or bringing health care to the homeless and uninsured, and education to the incarcerated. And the list goes on. And on. And on. The spirit of flexibility here at Stanford encouraged each of us to experience medical school as whole people, in whatever ways felt meaningful to us. And that was a gift.

Now for the bad news: residency was not designed like Stanford Medical School. Many of us have already gotten a taste of this, when we returned our carefully thought-out holiday request forms only to have them completely ignored. But we are Stanford students! We are tempted to cry. You can't treat us this way! Some of us may already have attempted to page Dr. Wolfe. But the fact of the matter is, we have led very, very privileged lives here. We have been allowed to make choices for ourselves that other medical schools do not afford their students; we have been wearing long coats from day one, both literally and figuratively. We have gained practice being strong in our selves, we understand the importance of balance, and we have been entrusted with the flexibility to cultivate it. We are the yogis of med students. And as such, we have a responsibility to continue the tradition into the next phase of our journey. If we find that residency is not nurturing us enough, let us work to change our residencies. Start a residents' support

group. Go part time. Join the residents' union and, if there isn't one, start it up. True, we may find that change does not come easily in our intern year, or the next, or even the next, but let us not despair—there will be a time when we will be the ones making the decisions, and we will keep a good list. In the meantime, we must take care of ourselves. Learn to be present with our own needs--physical, emotional, spiritual—and then, seek to meet those needs. Don't skip meals just because it's inconvenient for the team. Everyone, it turns out, needs to eat. Continue to find ways to make your soul sing, and then do those things. Find something beautiful in every day, and something to love in every patient. Do not be afraid to admit your own ignorance, or to hold a patient's hand, or to cry in front of your attending when your patient dies. It is the little choices like these that inform who we are and who we become as doctors, and as people, and we have the chance to make them every single day. Above all, let us not be afraid to be human beings, to be our true selves, and to continue to choose our own path. Let us teach the world that doctors can be strong, balanced and whole people, and let us change the face of medicine.

Thank you. And namaste.

2004 Commencement Speaker

Paul Michael Glaser, M.A., Honorary Chairman of the Elizabeth Glaser Pediatric AIDS Foundation

When Dean Pizzo asked if I would speak at your commencement, I was complimented, given that,...as much as a part of me may have wanted to have been a Doctor or a researcher at one time,...apart from spending a fair amount of time with Doctors and researchers over the past fifteen years, I had little knowledge of the journey to becoming a Doctor, or a researcher. In college, where I received a B. A., majoring in English Lit and Theatre, I had friends who were pre-med. Their curriculum was intimidating. I failed Chemistry and only passed Biology because I had had a very rigorous teacher of the subject in High School. I went on to three semesters of graduate school while my doctor-in-training friends proceeded on their journey through med. school, internship and residency. The closest I ever got to that world was playing the role of a Doctor. Peter Chernak on the soap opera, "Love of Life." He fought the establishment, slept on a cot in his lab, cooked polish sausages over a bunsen burner, and seduced the nurses. Not bad. He also had the ability to heal people whenever the writers felt like it.

A couple of years ago, I was asked to address a conference of Surgeons by a Doctor who wanted to promote collaboration amongst this rare breed of specialists. I found myself remembering a surgeon who had worked on me after I had had a terrible accident when I was a young man. His name was Edgar Holmes. He was tall, white haired, a New England Yankee. Quiet and very imposing. And then I thought on when, as a boy, I had gone hunting with my bow and arrows,...and the first animal I shot was a squirrel. I shot him right through his mid-section. And when I picked him up, skewered, still alive, clawing at, gnawing on my arrow, I felt sick to my stomach. It was as if I was holding mortality, his and mine, on that feathered shaft. And then I thought on the stories I had

heard of young doctors in training, experiencing their first cut, be it frog or cadaver, or more to the point, that first brush with their vulnerability to death and it's ensuing fear. And I thought of how my Yankee Dr. Holmes along with these men and women had gone on, as we all do, distancing themselves, inuring themselves to that moment of vulnerability, seeing this as a necessary thing to do in order to 'maintain the objectivity' to be a good doctor, a good surgeon. For, to go into the fear, to relive the fear, the vulnerability with every cut, every opening of the human body every exposure to mortality would be unthinkable, destructive. How could a person survive the emotional stress? Maintain control of their lives? Continue to be creative?

'Maintain control.' 'Be creative?' The first is a conceit that labors in the illusion that control is achievable. The second, 'being creative,' ironically requires a 'loss' of control. I have spent the last six years reinventing my career, studying writing. And many is the time that I will sit down with a specific task or objective in my head as to where I want to go, what I want to say, and try as I may, I can't make it happen. Then I remember that what **is** happening for me in that moment, right then, is, in fact, the **only** thing I know. And if I allow myself to write from that place, acknowledging what is, surrendering my need to control it's outcome, design its direction, I will discover what it is I and my characters want to say and do. The fear, of course, is that it will have nothing to do with what I am trying to write. And my experience,...always, without fail, is that when I have faith in what is, when I own what is, then my characters immediately join me in my journey, my search. And since the story is coming from me, my characters can then take me by the hand and lead me through it. They can talk to me. When I have faith.

When I direct actors, I often try to put them in a place where they have no control, where they are most scared and have to experience themselves naked, in the moment, only able to cope with what is. And when it happens, and they realize they're not going to die from it, they experience a high. A re-affirmation of faith. A connection with something larger than themselves to which they can cede all control. This 'connection' with something larger is what one might call '**being creative.**' Whether it is acting, painting a sunset, telling a story, inventing a new piece of software, selling a new line of dresses, discovering a cure, or affecting a dialogue between mortal enemies,...it is what we, as human beings, are about. We live to commune. We live to create. Our enduring biological and spiritual drive is to create, to live in the act of becoming. It is not a choice. It is not something over which we have any control. It is our experience of our existence. Our **choice** is what we do with our **minds**, with our **fear**.

When my life got caught up in the AIDS epidemic, Doctors were no longer an occasional visit for a physical or some passing concern, researchers no longer magicians I read about in magazines and newspapers. In my journey of losing a wife and daughter to AIDS, and then chairing the Elizabeth Glaser Pediatric Aids Foundation, I found myself talking to, listening to, watching Doctors and researchers. I got to see their humanity, often guarded, hidden behind their white coats, stethoscopes and microscopes. I got to see how they dealt with what they knew and what they didn't know. I got to feel their frustration, see their defense against their fear of being powerless. I got to experience their humanity, their hope, their need to find, to do, to be, to heal. Those that were creative, and those that

were reactive and functional, incurious plumbers and electricians, unable to hear ,...listen to the quiet screams for help coming from our common struggle with life and death. Those that saw themselves as **still** learning, searching for themselves in the plight of others, and those whose priority was the financial success, security and need for an identity as being valid, someone of importance. One of the interesting aspects of age is perspective, getting to see how human behavior cuts across all walks of life, allows us, if and when we choose, to see ourselves as having more in common with our fellow man than we would like to believe. It gives us who are traveling only **slightly** ahead of you, the advantage of hindsight, of seeing our youth in you, knowing what you don't, can't: that we really **have** been there, felt and known everything that you have felt and known; the sex, the drugs, and yes, the rock and roll, as amusing or unappealing as that may appear to you,...And that we really have experienced so much of your struggle. However, our hindsight doesn't give us **your** perspective of this world you're inheriting. Of the greater amount of information **you** process each day. Of how it feels to be in **your** skin, living cheek to jowl, so much closer through television, computer technology and airplane travel to your fellow man. Of how it feels to hear so much more acutely the howling vacuum of anonymity. And of how it feels for you to know consciously or subconsciously that we are, for the first time in the history of mankind living with an awareness that this planet, this mother earth, our host, is a provider of **finite** resources; is being overpopulated, polluted and used up. And we can only **imagine**, when we are not in our own soup, how you deal with the dawning awareness that in your world there is less of everything. Less wealth concentrated in fewer hands. Less education, less opportunity, less hope for our children, for our children's children to secure a future. And in the balance of the universe, of life, where there is less, there is always more. More fear, more violence, more disease. A greater gulf between those that have and those that do not. A greater need to hold on to what we have, to deny it to others, to hide behind religious and political philosophies, belief systems that temporarily comfort us with the illusion of feeling powerful, righteous, right and in control, because the alternative; to acknowledge how fearful we ALL are, is just too damn scary, too damn chaotic. Dean Pizzo wanted me to speak to my experience for the necessity for research and advocacy in the world of science and medicine. We are living in an age where more and more our choices have to do with the practical exigencies of our existence, – securing a place in the world for our selves, our families, paying the rent, putting food on the table, providing an education, a future. Research doesn't often provide for such security. In the world of pediatric medicine, for example, there are other applications of one's scientific and medical training that are far more lucrative. I could speak to you of the importance of seeking, searching and re-searching, - of how much of a difference advocacy has made in AIDS, as well as so many other areas. I could also speak to the stagnation of research, of how our fear of change, fear of the unknown causes us to accept, even defend the status quo – avoid the tough questions to which there seem to be no answers. I could speak to you of the lack of progress in impacting AIDS the world over and the dearth of researchers in our schools and hospitals. However, today I want to speak to that part of us that allows us to help ourselves and each other in the face of our fear. That part of ME, that in the beginnings of this AIDS pandemic that hit my family, embarked on a journey wherein, following the death of my daughter and

impending death of my wife, I was given a choice: to either be a victim in my perceived powerlessness to do, affect anything, - and in that place to become a bitter old man, or to find in my helplessness and fear a way to honor my journey, find my heart, learn and grow. I was fortunate to be shown that choice.

It is said that only those that have experienced their own mortality through the loss of a loved one or a near death experience of their own can know that choice, because that is the greatest experience of our fear of helplessness; our mortality. I would venture to say that, while we may go to great lengths to deny it, we are quickly approaching a time when this fear, this extreme helplessness is showing itself in more and more ways as it bubbles, roils beneath a surface that we are ever determined to keep calm, controlled, and in place. Our fear is an anathema to us, and we go to great lengths to avoid it – to the detriment of our creativity, of our very act of being, and we sacrifice our ability to search, and in the accepting of the status-quo, to re – search, to rediscover, to re – attach to that body of knowledge of which we are all a part. To re-member that which we all knew at the moment of our birth. We sacrifice our experience of ourselves to be created, and to be creative. All in the name of security. We make choices away from our hearts, away from our real needs as individuals, and as a civilization.

And yet we have a great need to experience our fear on some level. We tell cataclysmic stories, movies like ‘The Day After,’ where we get to experience our **common** fear as well as our ability to **overcome** that fear. For that is the sociological and spiritual function of our story-telling; to reaffirm our ability to overcome our fear of death. Yet, how is it that in our daily lives we create whatever aversion we **can** to our fear; be it over-indulgence in food, drugs, work, or our dependence on judgements that assure us that we are right, they are wrong, they are weak, we are strong, they don’t know, we do,...our way is best, theirs isn’t. How is it that our fear is an anathema to us? That we go to extreme lengths to keep our fear at bay and only allow ourselves the experience of it in the relative comfort and security of our stories, our religious rituals, our movies, our music, and the heroic exploits of our sports heroes? What is this fear that won’t go away, try as we may, try as we may? This fear that lurks in the shadow of our lives, always there whether we want to acknowledge it or not? The Great Creator of Denial? And as it has been said; that is no river in Egypt.

The great Masters,...Jesus, Bhudda, Muhammed, and others studied and spoke to this fear. They spoke to this fear of our mortality and our seeming powerlessness to do anything about it, powerlessness to affect the inevitability of the death of our animal selves. They studied and taught that our fear is not our **enemy**, not something to be avoided at all costs, contrary to the romantic notion that “ There is nothing to fear but fear itself.” That when we experience our fear, when we say the words...”I am scared,” we have the **choice**, the ability to acknowledge that being ‘scared’ is not **who** we are. It is not our identity. And while there is a **part** of us that **is** scared, there’s also a part of us that **isn’t** scared. That we can choose to identify the location and parameters of our fear as well as those parts of us that are not experiencing the fear. I feel fear in my belly, or my chest, or my throat,...but right then, I do not experience it at the top of my head, in my little finger, at my elbow. How is that? And where am I making this observation from? What part of me is able to see my pain as something apart? See my fear as something

apart? Is that **part** of me the same part that allows each one of us, as if suspended in the air and looking down from above, to see ourselves, me see myself standing here, talking, you see yourselves sitting there, listening, bored, interested, or confused, -- Is that the same part of us that's able to watch ourselves think and feel? Is that place, from which I am seeing all of this who I **really** am: my awareness, my consciousness, that knowing place that is a part of all knowing,...to which we are all a part of?

And when we are able acknowledge this, see our fear and pain from this place apart, to not say "I am scared" as if that was who I was, we then have the opportunity to say: "Boy, this is really difficult being a human being. Difficult knowing at a cellular level, a biological level that once conceived, our clock is ticking, our dying has begun, and we have no control over that." And from this witnessing place in us, we have the opportunity to watch our egos, our minds, whirring and burning in an effort to create some illusion that we **do** have some control, some power. We have the opportunity to see how our minds create belief systems, illusions of ownership, judgements of what is good, bad, true, false, beautiful, ugly.....AND that none of it changes the basic truth of the death of our lives in the constancy of change. And in that opportunity to witness our plight as human beings in the presence of our fear of our mortality, we can choose to hate ourselves, or we can choose to feel compassion for ourselves. And when we choose compassion for ourselves, we can find compassion for others. And at that moment, we can know in our hearts, in our beings that we all indeed, are one. What the Masters learned and practiced is that it is necessary to know our fear, to acknowledge, sit with our fear, in order to know our hearts. That our acknowledgement of our fear is the path to our compassion, the path to our capacity for love. We need our fear,.....in order to find our love. They go together. Ying and Yang.

Are we living in the greatest level of fear known by mankind to date. Are there more without than with in the world today? In this country today? Is the gulf between rich and poor widening? Is there less education for the masses? Less taught? Does that leave more and more with less and less options, choices, hope for a future, for their children's future? Yes. Does today's world offer so little to these people that only an afterlife seems a plausible answer? Yes. Has the world become so materialistically saturated in the wake of our American way of life and so spiritually bereft that extreme fundamentalism is growing stronger and stronger, not only in Islam, but in Christianity and Judaism? Do we know this extremism in our own country, our own government? And are we really asking why so many are laying down their lives, lives bereft of hope for a future, and taking others' lives with the weapons we have sold them, profaning the dreams we have sold them? And then taken away from them? All in the name of 'Democracy' when what we really mean is 'capitalism,' exploitation, and ownership. All in the name of 'human rights,' when we have grossly violated the rights of so many humans in pursuit of our own material interests? All in the pursuit of control?

Are our arms tightening around what we own? Grasping onto what we have, what we think we need to control? Isolating ourselves from ourselves from our own humanity as well as the world's? Where will we in this country be in ten, fifteen years when China is the financial juggernaut of the world and we have only a massive cache of weaponry to maintain a reactive control over a disappearing marketplace and a presence in a world

where others have chosen to trade their goods elsewhere? Are we truly so blind to historical perspective because our leaders either cannot read, or are too proud and narcissistic and afraid to read, and refuse to see the bloody writing on our walls? How much larger do we have to make those letters so that our leaders will heed the lessons of those who came before?

How are we to find our hearts in this time. How are we to find our creativity? Our compassion? Our humanity? How are we to grow when so much around us is dying?

To be a good doctor, a good researcher is to be one who can listen, assimilate and diagnose information from without, but can also listen and hear what is being said from within themselves. Committed to sitting with their own fear and vulnerability in order to **learn** from themselves in the effort to heal, to discover. Committed to pursuing the acknowledgement that we are all the same, all one. Committed to looking beyond what they think they want to find, to know. To expand the parameters of what they deem feasible, controllable. To seek, to learn where it is not safe and comfortable, but to have faith in the wider perspective where all disease, all life are part of the 'one.' Connected, and as connected, collaborative. And that to learn from this collaboration, that we must collaborate ourselves, must work together as one. Learn and feed off each other's humanity, each other's fear, hope, and faith. Experience our compassion and creativity in each other.

We live our lives to die. With each exhalation. Each letting go. Each moment of release,...we seek, as lemmings to the sea, to die into the 'one,' the 'all,' the 'everything' of existence. We practice this in the way of our lives. We worship it in our heroes, who, in the face of great adversity and symbolic or very real death, are able to stay present, acknowledge their fear, and from that other place of awareness, of consciousness, are able to achieve heroic results. We rejoice in it when we stand with our hero to home plate, bottom of the ninth, bases loaded, score tied, two outs, last game of the world series and he hits the home-run. We rejoice in it in the well hit golf ball or tennis ball. In the transcendence of a performance, a great discovery, an heroic sacrifice, in the birthing of a child, in the communion with anything or any body that gives us our sense of being one. Of belonging. We seek and worship surrender to a higher good,...a place of peace and oneness. A state of being that is change, where we get to visit, pass through, pass from, and let go of.

Today is but a moment along the way of your journey, your children's journey, the world's journey. The level of opportunity for compassion, for love, for the human-ness of our beings to evolve past our animal selves, is commensurate with the amount of fear and hate and destruction we are experiencing today on this planet. You can and will be cowed by it. It will constantly infect your lives, try to beat you down into apathy and cynicism, threaten to trample your hopes and dreams into regrets and self recriminations. It will want to seduce you into hate and anger, impatience and intolerance, harden you into judgment. **It will not** deprive you of your God given right to choose. Your divine right to gain strength and succor from the innate knowledge that we belong to each other, to the one, to all. That there is an irrefutable truth to our existence proved by our ability and choice to acknowledge our consciousness. This is your inheritance. This is what all the lives that have come before you have given you. This is what you can give to your

children. To the world. That you have the choice of consciousness. You have the choice to practice that choice.

In closing, I would like to share a favorite poem that I suspect many of you are already familiar with. To me, it's beauty is that it continues to reverberate in me, years after I first read it.

*Two roads diverged in a yellow wood,
And sorry I could not travel both
And be one traveler, long I stood
And looked down one as far as I could
To where it bent in the undergrowth;
Then took the other, as just as fair,
And having perhaps the better claim,
Because it was grassy and wanted wear;
Though as for that the passing there
Had worn them really about the same,
And both that morning equally lay
In leaves no step had trodden black.
Oh, I kept the first for another day!
Yet knowing how way leads on to way,
I doubted if I should ever come back.
I shall be telling this with a sigh
Somewhere ages and ages hence:
Two roads diverged in a wood, and I-
I took the one less traveled by,
And that has made all the difference.*

Faculty Awards

In addition to congratulating our students for their accomplishments, commencement is also a time to honor faculty who have made significant contributions to their education. Accordingly, I am pleased to list the teaching awards that were announced at the School of Medicine Commencement.

The Arthur L. Bloomfield Award: In Recognition of Excellence in the Teaching of Clinical Medicine

Steven Guest, Associate Professor of
Medicine

Myer Rosenthal, Professor of Anesthesia,
Medicine , and Surgery

Barry Rosen, Clinical Associate Professor
of Medicine

**The Henry J. Kaiser Family Foundation Award: For Excellence in
Preclinical Teaching**

Gregory Gilbert, Clinical instructor, Surgery and
Emergency Medicine

John Gosling, Teaching Professor, Surgery and Anatomy

Elliot Wolfe, Director, Office of Medical Student
Professional Development

**The Henry J. Kaiser Family Foundation Award: For Outstanding and
Innovative Contributions to Medical Education**

Julie Parsonnet, Associate Professor of Medicine
(Infectious Diseases)

**The Henry J. Kaiser Family Foundation Award: For Excellence in
Clinical Teaching**

Barry Rosen, Clinical Associate Professor of Medicine

Myer Rosenthal, Professor of Anesthesia, Medicine, and
Surgery

Thomas Krummel, Professor and Chair, Department of
Surgery

The Franklin G. Ebaugh, Jr. Award: For Advising Medical Students

Theodore Sectish, Assistant Professor of Pediatrics

The Lance Armstrong Award

Lars Osterberg, Clinical Instructor, School of Medicine

The Compassion in Medicine Award

Lars Osterberg, Clinical Instructor, School of Medicine

The Alwin C. Rambar-James B.D. Mark Award: For Excellence in Patient Care

Lorry R. Frankel, Associate Professor of Pediatrics (Intensive Care)

Stanford University School of Medicine Award for Graduate Teaching

W. James Nelson, Professor of Molecular and Cellular Physiology

Stanford University School of Medicine Award for Outstanding Service to Graduate Students

W. James Nelson, Professor of Molecular and Cellular Physiology

Congratulations to all.

Graduates listed below are our 2004 graduates for the School of Medicine

MASTER OF SCIENCE

Caroline Elizabeth Annis	<i>Epidemiology</i>
Jenifer Elizabeth Austin	<i>Neurosciences</i>
Ali Raza Awan	<i>Biomedical Informatics</i>
Joanna Eileen Boerner	<i>Microbiology and Immunology</i>
Elbert E. Chang	<i>Molecular Pharmacology</i>
Amit Garg	<i>Biomedical Informatics</i>
Michelle Lynn Green	<i>Biomedical Informatics</i>
Corinna Anke Haberland	<i>Health Services Research</i>
Matthew Leigh Huggins	<i>Neurosciences</i>
Stella Mai Huang	<i>Epidemiology</i>
Richard Brent Jacobsen	<i>Neurosciences</i>
Amit Kaushal	<i>Biomedical Informatics</i>
Esther Jean Hyung Lee	<i>Epidemiology</i>
Robert L. Lobato	<i>Epidemiology</i>
Surag Subhash Mantri	<i>Biomedical Informatics</i>
Zachary Scott Pincus	<i>Biomedical Informatics</i>
Erin Gourley Reid	<i>Epidemiology</i>
Chistopher David Sundberg	<i>Microbiology and Immunology</i>
Jeffrey James Swigris	<i>Epidemiology</i>
Stream Su-Ching Wang	<i>Developmental Biology</i>
Kevin Gregory Williams	<i>Genetics</i>
Lisa Jun-Pei Wong	<i>Biophysics</i>

DOCTOR OF PHILOSOPHY

Nadia Patrice Cheryl Allen

Biological Sciences

*Networks of Protein Interactions at the Nuclear Pore Complex in *Saccharomyces cerevisiae**

Nizar Nooruddin Batada

Biophysics

Stochastic Aspects of Biological Signalling

Rebecca Restituto Begley

Molecular Pharmacology

Therapeutic In Vivo Applications for PKC-Modulating Intracellularly-acting Peptides

Nicole H. Lazarus

Immunology

Chemokines and the Homing of IgA Antibody Secreting Cells: CCL25 and CCL28 Coordinate and Direct IgA Antibody Secreting Cells to Mucosal Sites

Mike Hsin-Ping Liang

Biomedical Informatics

Integrating Sequence and Structural Information for Detecting Functional Sites on Protein Structures

Augusto Eduardo Llosa

Epidemiology

Helicobacter Pylori Infection and Cancer

Jonathan Adam Bernstein

Genetics

*Global Analysis of mRNA Decay in Escherichia Coli
Using cDNA Microarrays*

Grace Y. Bhudhikanok

Epidemiology

*Race, reproductive history, and bone density in
adolescents and young adults*

Igor Brodsky

Microbiology & Immunology

*Role of Salmonella Virulence Genes in Bacterial
Resistance to Antimicrobial Peptides and Systemic
Disease*

Michael Joseph Byrnes

Biological Sciences

*Synthetic Lethal Analysis of S. cerevisiae CDC28 and
Its Role in Microtubule Function*

Carol Hsen-Fae Cain

Biomedical Informatics

*Representing and Reasoning About Contextually
Changing Organizational Behavior Using Simulaton
Models of Medical Work*

William H. Carr

Immunology

*Mechanisms of NK-cell Recognition of HCMV
Infected Cells*

Barry L. Lubarsky

Biochemistry

*Tracheal Tube Formation in Drosophila
melanogaster*

Kevin Michael Marks

Molecular Pharmacology

*Fluorescent Sensors and Effectors in Spatio-
temporal Studies of Cell Biology*

Tracey McLaughlin

Epidemiology

Michelle Leigh Monje

Neurosciences

*Irradiation, Inflammation and Adult Hippocampal
Neurogenesis*

John Isaac Murray

Genetics

*Diverse Gene Expression Responses to Stresses in
Cultured Human Cells*

Other Honors and Awards

Ann Arvin, Lucile Salter Packard Professor of Pediatrics, Microbiology and Immunology, has been awarded the Albion Walter Hewlett Award. This prestigious award recognizes physicians of care and skill who are committed to discovering and using biologic knowledge, wisdom and compassion to return patients to productive lives. Dr. Arvin is the sixteenth recipient of this award and joins a very impressive list of predecessors.

Joseph Hopkins, Clinical Professor of Medicine, recently received the Master of Medical Management Degree from the Marshall School of Business, University of Southern California. This degree, offered by only three universities, is specifically tailored for physicians seeking advanced leadership and management skills needed to address the challenges of the evolving health care delivery system. Dr. Hopkins currently is the Associate Director of the Center for Education in Family & Community Medicine, Director of Primary Care, and Associate Chief of Staff of Stanford Hospital and Clinics.

Neil Risch, Professor of Genetics, and of Statistics and of Health Research and Policy, was awarded the Curt Stern Award. It is given by the American Society of Human Genetics, the leading human genetics society worldwide and is awarded in recognition of outstanding contributions to human genetics over the past ten years.

Congratulations to all.

Announcements

Preview the New Lane Library Website: Simplified access and smarter searching is what drives the new Lane Medical Library website. A preview is now available to these new features: 1) new clinician and researcher views that include a clinical core or a bioresearch core search across multiple resources; 2) a single eResources search to find any eJournal, eBook, database and more; 3) a new "article finder" search that finds any online journal at Stanford, not just biomedical titles; 4) a new article linker in PubMed@Stanford that will match all our online journals or provide a lookup for print availability or an interlibrary loan form if not on campus; 5) off-campus access to all content directly and authentication using SUNetID; and 6) new colors and graphics that match the SOM design. The site is a joint development effort of the IRT group. The preview link is highlighted on the current website at <http://lane.stanford.edu>.

Lane Medical Library TECH Desk Pilot ends June 11th: The IRT TECH Desk, a drop-in laptop and software support service program that offered in-person expert advice on a variety of computing, networking, multimedia and instructional technologies located at Lane Medical Library, ended on June 11 after

a 6 month trial. Data gathered during the course of the pilot will help IRT shape the course of the School of Medicine's evolving desktop support strategy. Lane and IRT are interested in feedback about the service; why you used it, the quality of the service, why you didn't use it, etc. If you have comments or suggestions, please email them to: laneinfo@lanelib.stanford.edu.

Appointments and Promotions

- **Lawrence Chu** has been appointed to Assistant Professor of Anesthesia at the Stanford University Medical Center, effective 6/1/2004 to 5/31/2007.
- **Michael Kaplan** has been appointed to Professor of Otolaryngology and Professor, by courtesy, of Neurosurgery at the Stanford University Medical Center, effective 6/1/2004 to 5/31/2009.
- **Timothy McCulley** has been appointed to Assistant Professor of Ophthalmology at the Stanford University Medical Center, effective 6/1/2004 to 5/31/2007.
- **John Morton** has been appointed to Assistant Professor of Surgery (General Surgery) at the Stanford University Medical Center, effective 6/1/2004 to 5/31/2007.
- **Stephen Roth** has been appointed to Associate Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, effective 6/1/2004 to 5/31/2009.

Dean's Newsletter July 5, 2004

Welcome to New Housestaff and Fellows

It was just three weeks ago that we bid farewell to our medical and graduate student graduates. Many have gone across the nation to commence additional training as residents or postdoctoral fellows. Some are continuing their work and study at Stanford. During the past week a large influx of new graduates or trainees have arrived to begin their further training in clinical medicine and/or research at Stanford Hospital & Clinics, the Lucile Packard Children's Hospital and the School of Medicine. I want to welcome each of them to our Stanford community.

Increasingly, we are addressing ways to better align the Medical School with the postgraduate programs at our teaching hospitals. One way to accomplish this will be to extend our scholarly concentrations to residents and fellows – which we hope to achieve over the next couple of years. We also want to better align residents and fellows to the academic programs and offerings that are supported through the School and thus provide a more contiguous and connected educational opportunities that continue to link science and medicine and which foster our overarching goal of *Translating Discoveries* (<http://medstrategicplan.stanford.edu/>).

Professionalism at Stanford University Medical Center

In tandem with the School of Medicine's commitment to the Respectful Workplace, the Medical School Faculty Senate established a Professionalism Subcommittee earlier this year that is chaired by Dr. Clarence Braddock, III, Associate Chief of General Internal Medicine, that was charged to develop a framework and operational definition of professionalism that encompasses the medical school, hospital and clinics and that a strategy for implementation of professionalism along with methods to evaluate its impact on students, faculty and staff throughout the medical center.

The development of the common definition of Professionalism commenced with the adoption of the "Professionalism Charter", a document that embraces the core principles of professionalism and that has been ratified by over two dozen medical specialty organizations. Among its core responsibilities are a commitment to professional competence, honesty with patients, patient confidentiality, commitment to maintaining appropriate relations with patients, improving quality of care, improving access to care, just distribution of finite resources, commitment to scientific knowledge, maintaining trust by managing conflicts of interest, and commitment to professional responsibilities. During the past months the Professionalism Subcommittee has been working to make the principles of professionalism more concrete and that there was a need to develop a compendium of examples of acceptable and unacceptable professional behavior. With this the committee will be recommending a series of actions throughout the medical center. Indeed, the medical school curriculum has already been modified to include sessions on professional conduct specifically focusing on the type of behavior to which our students will strive.

In addition to thanking Dr. Braddock and his committee for their progress to date, I want to underscore how important I feel these initiatives are for our community. Achieving and maintaining a respectful workplace that fosters professionalism must be among the highest priorities for every one of us. Indeed, we can only be successful when we each subscribe to professional codes of behavior – and when we are intolerant of those who are disrespectful or unprofessional. During the past three years we have tried hard to ensure a high standard of expectations for having our School of Medicine be a respectful workplace. The code of professionalism extends that expectation to all members of our community throughout the medical center. For the sake of our missions, those we serve – and each other – we should expect nothing less than a respectful workplace and highly professional behavior by all. I certainly will continue to do everything possible to assure that we achieve those goals.

US News and World Reports Hospital Rankings

Today's issue of *US News and World Report* released its annual ranking of hospitals based on surveys of board-certified physicians across the country. Both Stanford Hospital & Clinics (SHC) and the Lucile Packard Children's Hospital (LPCH) have received "Honor Roll" ratings, with SHC ranked 14th (up from 15 in 2003) and LPCH ranked 12th (up from 18th in 2003). In the latest survey Neurology and Neurosurgery improved most

dramatically (to 12th in 2004 from 25th in 2003) and improved standing was also noted for the SHC ranking in Cancer, Orthopedics, Psychiatry, Respiratory Disorders, Rheumatology and Urology. At the same time there were slight declines in SHC's ranking in Cardiac, Kidney Disease, ENT, Gynecology and Rehabilitation.

It is important to emphasize that these scores are in part reputation as well as based on metrics that are influenced by the size and scope of programs. Because Stanford University Medical Center is small compared to other major academic medical centers, the relative size of our programs has an impact on the rankings. That said, SHC and LPCH have done quite well and are clearly among the nation's most valued hospitals. Indeed, there is every reason to expect that with our recent recruitments, new programs and accomplishments, these rankings will improve further in the years ahead.

It is also important to retain perspective since these rankings are far from perfect, even though they have a considerable impact on how the public views hospitals and on how hospitals and medical centers promote or market their putative excellence. As you may recall from my comments about the methods used by US News and World Report to rank medical schools (see April 5, 2004 edition of the Dean's Newsletter http://deansnewsletter.stanford.edu/archive/04_05_04.html), size plays an important role since a major factor is the overall amount of NIH funding. While Stanford School of Medicine was ranked # 8 among research medical schools its ranking is impacted adversely by the fact that it is among the smallest schools of medicine among its peers. Indeed, while Stanford has the highest amount of peer-reviewed funding per faculty member of any school in the nation, it ranks 12th in the total amount of funding – a factor directly related to its small size. I have been working to address the inaccuracy of this methodology and have communicated and met with the editors of US News & World Reports. I remain hopeful that they will place a higher value on quality over size in the methodology used to rank medical schools in the years ahead.

Trying to Understand the True Costs of Research

Research is one of our most important missions and it defines Stanford as Medical School and Academic Medical Center. As a small research-intensive school of medicine, our faculty competes quite successfully for highly competitive research funding support from the National Institutes of Health and other public and private funding agencies and foundations. While we are successful in having the highest amount of peer-reviewed competitive NIH funding per faculty member of any school in the nation, the research dollars we receive (both direct and indirect support) do not cover the entire cost of supporting the research enterprise of the school. It has been generally assumed that in order to support the research mission of an academic medical center, approximately 15-20% of additional institutional support is needed to subsidize the true cost of the research enterprise. To better understand the true cost of our research mission, Ms. Julia Tussing, Managing Director of Finance and Administration in the School of Medicine, presented the results of her study on the cost of the School's research mission at the June 18th Executive Committee.

The reasons for attempting to ascertain the cost of research include the need to understand better the resource allocation decisions we make, to inform fund-raising objectives, to achieve transparency, and to identify the sources and uses of funds associated with the research mission. The methodology used in the study was based on the University's annual Indirect Cost proposal for FY03, which includes all sponsored research and associated indirect costs, "departmental" research and associated indirect costs, and training grants. Using this analysis, a minimum and a maximum cost of research were estimated.

The results indicate that the total cost of the research mission is \$391.5M, plus or minus 5%. Of that total, research sponsors do not pay for \$67M. Therefore, this amount is an investment by the School in the research mission. For every dollar in sponsored funds, the School provides a matching 22 cents from other sources. Another way of expressing this is that every 22 cents on the School's part "buys" \$1.00 in research support.

Ms. Tussing noted that it is important to keep in mind the extent to which the School's missions are entwined. For instance, education occurs in sponsored projects as well as department funded research. In addition, there are many tangible and intangible benefits of research that justify the cost to the School.

Ms. Tussing's presentation generated lively discussion among the chairs and members of the Executive Committee. There was a sense that, although the School could use the different indirect cost reimbursement rates by different sponsors in a strategic way in order to decrease the School's cost of research (i.e., NIH vs. most foundations), this would not be a good idea. For instance, training grants pay a lower indirect cost, yet we want them so that we can support trainees. We also want to have junior faculty accept competitive funding from foundations even though it pays lower indirect costs, because the research it supports helps them gather data that can provide the basis for a subsequent NIH research proposal. Further, we should not allow our research agenda to be driven by the level of support if the nature of the research is compelling and important.

Although this is a work-in-progress, the benefit of this analysis is that it will allow us to make meaningful comparisons to other schools and against our other missions. We can use it to identify trends and make informed decisions on how to fund our investment in research, which is, of course, vital to the success of the school – and indeed is the reason for being the Stanford University School of Medicine.

The Importance of Human Subject Protection and the IRB

Human subjects protection is among the most important issues that academic medical centers face in the safe and responsible conduct of research. In an effort to monitor compliance with the regulations that govern the protection of human subjects, the Federal Office of Human Research Protections (OHRP) conducts not-for-cause audits of human subjects programs at institutions that receive federal funding. Results of these audits are made public, and failure to implement corrective actions may result in suspension of

federal funding. After a recent review of a major academic institution, OHRP published several of their findings and recommendations.

One of the key findings made by OHRP was the observation that human subjects activities had commenced prior to IRB review and approval. This constitutes serious non-compliance and must be reported to OHRP. **Because this is so serious and potentially can impact our clinical research mission, I want to remind all investigators that it is of critical importance to submit human research activities to the IRB for prospective review and approval. This includes new protocols, revised protocols, and renewal of existing protocol activities.**

Other findings discussed by OHRP involved matters that are handled through our IRB review process. They included the omission of relevant Federal grant proposals; consent documents lacking complete subject procedures, especially as they relate to possible risks and discomforts; and consent forms that were overly complex and not understandable to all subjects.

It is essential to remember that all IRB submissions must be complete, accurate and timely. I would strongly encourage you to visit the Human Subjects website for more information pertaining to the protection of human research subjects <http://humansubjects.stanford.edu/medical/>. Also please feel free to contact the IRB Education Specialist, Amanda.Grimes@Stanford.Edu, (724-7141) with all of your IRB questions.

Update on the Institute on the Environment

At the June 4th meeting of the Executive Committee, Dr. Jeff Koseff and his colleagues Drs. Gary Schoolnik, Peter Vitousek, Ron Dunbar, Suki Hoagland, Steve Schneider, and Leigh Johnson discussed the recently established Institute for the Environment. The Institute is a University-wide initiative that involves faculty from the schools of Humanities and Sciences, Medicine, Law, Engineering, and Earth Sciences, as well as the Institute for International Studies and SLAC. It currently has 232 faculty and research scholars on its email distribution list. I briefly described some of the ongoing development of this new Institute in the April 19, 2004 issue of the Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/04_19_04.html).

An important emphasis in this discussion was the possible connections between the environmental sciences and the research agendas within the School of Medicine. For instance, connections between environmental science and biomedical research can be envisioned using the hypothesis that disease probabilities are based on combinations of genetic predispositions and environmental stressors. Specific areas of intersection include environmental toxicology, emerging infectious diseases, biodiversity and the search for new drugs, human physical and intellectual development, population growth and crowding, and environmental psychology.

Areas of intersection between the environmental sciences and the clinical sciences include carcinogenic toxins, endocrine disruptors, reactive airway disease/allergy, diagnostics, animal surrogate markers of environmental toxins, and novel (or old) infectious agents. Intervention opportunities exist at the connecting points between the environment, the individual, and the community. In addition, the Institute is looking forward to developing connections with the medical curriculum in the form of environmental health modules and a scholarly concentration.

The Institute on the Environment has also formed an ad hoc committee on Public Health and the Environment, whose mandate includes the following items, among others:

- To prepare a document describing the research, education, and advocacy opportunities in the environmental health sciences
- To create a database of on-going research projects in the SoM that have an environmental science focus
- To initiate an interdisciplinary Environmental Medicine Forum seminar series

The Institute for the Environment is an exciting initiative that has great potential for interdisciplinary connections with our colleagues across the campus. Dr. Schoolnik is the School of Medicine liaison with the Institute. He has informed me that he welcomes suggestions and ideas from our faculty as to how we might strengthen those connections, and I encourage you to be in touch with him (schoolni@cmgm.stanford.edu).

Update on the Department of Pathology

At the June 18th Executive Committee meeting, Dr. Stephen Galli, Loveless Professor in the School of Medicine and Chair of the Department of Pathology, presented an overview of his department's mission and activities. The mission of the department is to improve the diagnosis, treatment, and basic understanding of human disease by clinical service, education and research. Structurally, the department consists of a leadership group, the Pathology Service, the Stanford Blood Center, PAVAHCS Pathology, Research, and Cores.

The spectrum of research done in the department ranges from basic science research to translational research to clinical investigation. Among the basic science research areas are stem cells, cell cycle regulation, oncogenes, leukocyte homing, protein evolution, and RNAi. Translational topics currently under investigation include immunotyping of lymphomas, cyclosporine mechanisms, microarrays and cancer, mouse models, and fly models. In the clinical arena, department faculty are studying such issues as diagnostic support for transplants, AIDS/CMV screening of blood supply, flow cytometry for HIV and other viral nucleic acids, molecular/genetic pathology, and dendritic cell trials.

The department's clinical pathology work consists of anatomic pathology and clinical pathology. Both are ranked very highly nationally. The anatomic pathology section has highly regarded ACGME-accredited clinical fellowships and outstanding translational/clinical research activities. The clinical pathology section has seen large

increases in the number and complexity of tests offered in recent years, as well as significant increases in productivity and net revenues. The Blood Center has 190 employees and provided 134,000 transfusable blood products in 2003 (about a 40% increase from the year 2000). The Center has also made significant clinical advances, including the first AIDS screening in the world, the first CMV screening, and the first dendritic cell clinical trial.

The educational activities in the department include medical students, graduate students, post-sophomore fellows, housestaff (residents and clinical fellows), and postdoctoral fellows, as well as medical technologists and clinical colleagues.

Dr. Galli noted some of the challenges facing the department at this time, especially in the clinical service areas. He emphasized in his presentation that pathology is interdisciplinary by definition and “interdepartmental” by choice. The department “creates the future” in research and clinical practice, and provides SUMC as well as regional, national and international clients with clinical services of high quality.

I want to thank Dr. Galli for bringing us up to date on the many activities and accomplishments of this multi-faceted department and I also want to thank the faculty, staff, and students in Pathology for their many contributions.

Bioengineering Department Recruits First Faculty Members

The new joint Department of Bioengineering has completed the recruitment of its first three new faculty members. By every measure this is a spectacular start to an exciting new department. The three new faculty include:

- **Dr. Jennifer Cochran** comes to Stanford from MIT's program in biological engineering with a strong track record in immunobiology and state-of-the-art training in protein engineering. Jennifer is poised to build a research program in biomolecular engineering of new materials and therapeutics.
- **Dr. Karl Deisseroth's** work with controlled neurogenesis and neuroengineering offers fantastic potential to treat a wide variety of neurological disorders. Karl completed his M.D. and Ph.D. degrees at Stanford and is jointly appointed with the Department of Psychiatry. Karl will be an active participant in the Neurosciences Institute.
- **Dr. Steve Quake**, a former Stanford undergraduate and now the Thomas E. and Dorie Everhart Professor of Applied Physics and Physics at Caltech, will be moving to Stanford this fall. Steve's research on single molecule biophysics, microfluidics, and DNA sequencing has made him one of the top bioengineering scientists in the country.

Drs. Cochran, Deisseroth and Quake will be based in the Clark Center. I want to commend Dr. Scott Delp, Chair and Paul Yock, Co-Chair, for the tremendous job they

have done in launching the department and for bringing these outstanding new faculty members to Stanford. While the department is still at its earliest stage of development, the recruitment of incredibly talented faculty, as well as students, offers clear evidence of tremendous future success.

Stroke Center Seeks JACHO Center of Excellence Status

Thanks to the leadership of Drs. Greg Albers, Michael Marks and Gary Steinberg, the Stanford Stroke Center is recognized as one of the best in the nation. It provides state-of-the-art clinical care and is a leader in new innovations that have decreased the morbidity and mortality caused by stroke. To further validate its position as the number one center for stroke management, the Center's leaders and staff are now seeking JCAHO Stroke Center Certification. Accordingly, a site visit was held on June 29th to review the Stanford program. I attended the first portion of the review and was enormously impressed by the depth and excellence of the Stanford Stroke Center. Hopefully, JACHO will provide the Certification that will further validate the excellence of this program. Special thanks to Drs. Albers, Marks and Steinberg as well as the very talented faculty and staff throughout the Medical Center who make this program so outstanding.

Steve Leibel Arrives to Direct the Clinical Cancer Center

In the March 8th issue of the Dean's Newsletter (http://deansnewsletter.stanford.edu/archive/03_08_04.html), I announced the appointment of Dr. Steve Leibel as the new director of the Clinical Cancer Center. As you may recall, Dr. Leibel is an internationally recognized oncologist who served as the Chair of Radiation Oncology at the Memorial Sloan Kettering Cancer Center until he joined Stanford in his role as Clinical Director of the Clinical Cancer Center on July 1st. I now want to formally welcome Dr. Leibel to the Stanford community. We all look forward to the important work he will do on behalf of Stanford.

I also want to use this opportunity to let you know that we are continuing to make progress in our application for becoming an NCI-designated Comprehensive Cancer Center. Each of the program areas are proceeding nicely and the only major (but still quite critical) task is the recruitment of the Principal Investigator. We still hope to complete that process in the next few months.

LCME Review Process Begins

The Liaison Committee on Medical Education (LCME) will be conducting a site visit of the Stanford School of Medicine on October 16-19, 2005 as part of its standard accreditation procedures. We have a mandate with this visit to achieve full accreditation in contrast to prior LCME visits in which several areas of non-compliance were identified. Indeed, this visit is critical to the future success of the School of Medicine.

Accordingly, preparations for this very important site visit include completing an institutional self study and developing an extensive database on all aspects of Stanford's medical education program, including facilities, curriculum, learning environment,

affiliated hospitals, graduate and post-graduate education, and research. The most recently completed academic year, 2003-2004, will be profiled in the database and the self-study.

Numerous subcommittees will be taking shape in the coming months, and each will hold approximately 2-4 meetings during the fall of 2004 to complete assigned parts of the self-study. We will seek broad based representation from administration, faculty, students, and other constituencies to serve on these committees. The monumental effort that has and continues to go into the substantive curriculum changes already underway are perfectly complemented by the detailed analysis of our programs required by the LCME self-study process, with the ultimate goal of assuring that the school's goals fulfill the requirements set forth by the LCME.

I have asked Oscar Salvatierra, MD, Professor of Surgery and Pediatrics, to shepherd the LCME accreditation project. He and Rebecca Trumbull of the Office of Institutional Planning may be calling on you for help. I ask that you be ready to participate in this important endeavor if called upon; I realize that most of you are already overburdened with responsibilities, but this enormous undertaking is essential for the well-being of the school, and I appreciate the extra effort it may require from you.

I also appreciate your cooperation throughout this important process at a critical juncture in the history of our school, and thank you in advance for your support.

Honors and Awards

- Dr. Marlene Rabinovitch, Dwight and Vera Dunlevie Professor of Pediatrics will receive the American Heart Association Prize in Basic Science Research at its Annual Meeting in November 2004. This is a wonderful honor and we offer our congratulations to Dr. Rabinovitch.

Dean's Newsletter July 26, 2004

The Clinician Educator Track: Opportunities for Career Development

During the past two years we have made a number of changes in the professoriate in the School of Medicine. Our goal has been to better delineate the pathways for career development and more appropriately align them with the goals and expectations of faculty, departments, the School of Medicine and the University. To be successful, academic medical centers require a multiplicity of skills, knowledge and expertise and need to foster a community of individuals to carry them forth. A medical school faculty must support and advance its missions in education, research and patient-care. At Stanford we are committed to assuring excellence in each of these missions. We want

also to foster collaboration, innovation and leadership in our faculty and students with an overarching goal of *Translating Discoveries*. (<http://medstrategicplan.stanford.edu/>)

It is important to recognize that to be successful as an outstanding investigator or clinician requires enormous time and focused commitment. While it was once believed that individual faculty should be outstanding in multiple areas (often referred to as the “triple threat” for those trained as MDs) in reality the time and skills required to be successful means that nearly all clinical faculty must choose whether to focus primarily on research or on patient care. Having outstanding full-time investigators and superb full time clinicians is important to the future of Stanford. That said, we also need to assure that we have a cadre of individuals who will serve at the interface as clinician-scholars/investigators in order to make sure that our efforts between “bench and bedside” are closely linked.

It is important that the professoriate be well defined to help assure the success of these goals and functions. Presently we have four faculty tracks in the School of Medicine: Investigator (or University Tenure Line), Non-tenure Line Research and Educator Track, Clinician-Scholar/Investigator (aka Medical Center Line) and the Clinician-Educator (which is centered within the School of Medicine). The guidelines for appointment and promotion in the first three of these lines are described in the Faculty Handbook or (<http://med.stanford.edu/academicaffairs/handbook/TOC.html>). During the past year we have made additional progress in defining the Clinician-Educator track and I want to make sure you are aware of the information and opportunities now available for this important career pathway.

First, I want to thank Dr. Ken Cox, Senior Associate Dean for Pediatric and Obstetric Clinical Affairs who chaired a task force to better delineate the opportunities and benefits for Clinician-Educators in the School of Medicine. I also want to thank the individuals who worked with Dr. Cox since this was an effort that required participation of the School, Stanford Hospital & Clinics, and the Lucile Packard Children’s Hospital. The Committee included Drs. Norm Rizk, Gerry Shefrin, David Stevenson, and Ron Pearl, Mike Peterson, Keith Grundy, Dave O’Brien, Marcia Cohen, Cindy Johnson, Julia Tussing and Kathy Gillam.

Importantly, the Committee underscored the importance of the Clinician Educators to the ultimate success of our patient care mission – as well as the overall mission of the School and Medical Center. They also recognized that this is a category that will require evolution to optimize success. For example, most of the physicians categorized as clinician-educators have heretofore been junior and transient in their stage of career development. Indeed, of the 313 individuals appointed as clinician-educators (a number of whom are part-time) the vast majority have only recently completed training and very few have been in their position for more than five years. Our goal is to make this an attractive career path, one that offers opportunities for career advancement and provides compensation and benefits that are attractive and competitive.

To accomplish these goals we will be seeking Clinician-Educators who are committed to this important career path, which will enable them to provide patient care for approximately 90% of their time and devote the remainder to education of students, residents and fellows. We will also be seeking more senior physicians for these roles and will use national searches to identify the best candidates for these positions – which will require an approved business plan by the School and respective hospital before an appointment can be made. Appointments may be 3-5 years in length and are renewable based on performance. We further envision that in addition to providing patient care, a selected number of Clinician-Educators may serve as Medical or Program Directors. The criteria for promotion, which may be found in the School's Faculty Handbook (<http://www.med.stanford.edu/academicaffairs/>) focus primarily on clinical excellence and teaching and do not require written scholarship (in contrast to the Clinician Scholar/Investigator track).

An important facet of the Cox Committee's work was to develop guidelines for compensation and benefits. The goal has been to develop a competitive compensation schedule along with benefits that can include housing assistance and professional development time. The compensation guidelines are available at http://www.med.stanford.edu/academicaffairs/C~E_Benefits.html. Eligibility for a number of the benefits are based on clinician-educator faculty rank, the date of appointment (some being post July 1 2004), and length of service. For additional information about the Clinician/Educator Housing Assistance Program see http://www.med.stanford.edu/academicaffairs/C~E_Benefits.html. Further information regarding the professional development opportunities for Clinician/Educators is available at http://www.med.stanford.edu/academicaffairs/C~E_Benefits.html

Our goal has been to develop a robust and attractive path that will permit us to recruit and develop outstanding Clinician-Educators. I am naturally cognizant that some in our community will continue to suggest that this is a tangential group but I want to underscore that I do not see it that way. In contrast, I see the importance of the Clinician-Educators to our future success in providing outstanding patient care and in further developing the clinical skills of our students and trainees. I see this track as one that can and should promote longitudinal career development and that will provide tangible value to both junior and more senior clinicians who excited about delivering outstanding patient care at Stanford and in being valued members of our community.

Charting a Future: Stanford University in the 21st Century

During the past year and especially over the summer, the Executive Cabinet (which is comprised of the President, Provost and Deans, including the directors of SLAC and the Hoover Institute) has been meeting regularly to craft the broad institutional initiatives that will shape the future of Stanford University during the 21st Century. What makes Stanford so exciting is the degree of interaction and cooperation that exists among the schools and how that is impacting the development of interdisciplinary research. Emerging from these discussions are 3 - 4 defining initiatives, two of which are already formed and two others that are being explored and developed.

The two initiatives that have been formed include BioX and the Institute for the Environment. Both are exciting in their own rights and both draw together faculty from virtually every School – and clearly from the School of Medicine. I have highlighted these in prior Newsletters.

The two additional initiatives that are evolving include the International Initiative, which is currently focusing on three overarching and interconnected sets of problems that will include:

- ***Pursuing Security in an Insecure World*** (including such issues as catastrophic terrorism, proliferation of weapons of mass destruction, ethnic conflicts and civil wars, interstate rivalries)
- ***Reforming and Improving Governance at All Levels*** (including existing international and regional institutions no longer equipped to cope with demands, problem of failing and failed states, the challenge of democracy and effective governance and understanding new forms of governance)
- ***Advancing Human Well-being*** (including economic development, global health, education and educational reform and equity [access to and distribution of resources, justice and human rights])

In addition, the faculty steering committee for the international initiative, which is co-chaired by Professors Chip Blacker (Stanford Institute for International Studies) and Elizabeth Pate-Cornell (Engineering), is also focusing on three crosscutting drivers that impact on the primary problems noted above and that include

- ***Globalization***
- ***Technological Change***
- ***Cultural Diversity***

The committee on the international initiative will continue to address the intersection of these issues, including their relationship to the initiatives on the environment and BioX. If you have an interest in this initiative you should feel free to contact our School of Medicine representative, Dr. Lucy Tompkins, Professor of Medicine (Infectious Diseases) at LucyTomp@stanford.edu or Drs. Blacker or Pate Cornell.

The other emerging initiative at an even earlier state of development is the “Arts Initiative” that is being lead by Professor Bryan Wolf. There are many reasons to include the arts as a broad university initiative, including the fact that the arts are about values, critical thinking, imagination, empowerment and globalization. The goal of the Stanford Arts Initiative is to engage the entire University – from science, medicine and engineering to business and law – “in an innovative, boundary – crossing effort to re-imagine the role of the arts at Stanford in the twenty-first century”. Among the tangible goals is the establishment of the Stanford Arts Center, whose goal will be to coordinate the many different arts programs already present at Stanford, to initiate new programs, to enhance the presence of the arts within the undergraduate residential life and to establish an active program of Arts Fellows and Artists-in-Residence. It is important to note that the School of Medicine also has a longstanding interest in Medical Humanities and the

Arts that has engaged students and faculty. Indeed, it is also worth noting that one of our new Scholarly Concentrations focuses on medical humanities. Thus, as this initiative evolves, it is clear that it will have important interconnections to medicine. The Committee will be doing outreach during this summer and I would certainly recommend that those who are interested to contact Professor Wolf (bwolf@stanford.edu).

In addition to these exciting initiatives, one other cross-school initiative that will take life over the next year will be the recreation of graduate education. The opportunity at Stanford is to develop new interdisciplinary and joint degree graduate education programs. To evaluate this, a Commission on Graduate Education is being established by the President and Provost that will, over the next year, critically assess ways that Stanford can pave new paths in graduate education. This too should be an exciting and important initiative.

Taken together these crosscutting initiatives on BioX, the environment, international issues, the arts and graduate education offer the template for further transforming Stanford. There are challenges we are uniquely poised to address – and that will provide an exciting time for Stanford in the 21st Century.

Dr. Irv Weissman Testifies Before a Senate Committee on Stem Cell Research

On July 14th the Senate Commerce Committee's Subcommittee on Science, Technology and Space held another session in a series of hearings addressing the stem cell research policy. Past hearings have served as a vehicle for Chairman Sam Brownback (R-KS) to promote opposition to embryonic stem cell research. This hearing, however, provided a tangible example of how the politics surrounding stem cell policy have changed in recent months.

Ryan Adesnik, Director of Federal Relations, attended the hearings and reports that Senator Brownback sought to limit the hearing's focus to success stories developed through adult stem cell research, hoping to make the case that such successes obviate the need to pursue embryonic stem cell research, a line of research that is far more controversial. However, the coordinated outreach efforts of academic institutions and disease advocacy groups provided a new political backdrop. That effort, which included public support from Nancy Reagan and letters signed by over 200 House Members and 58 Senators in public opposition to the President's stem cell research funding policy made it extremely difficult for Senator Brownback to limit debate. Of particular note, a clear majority of Senator Brownback's subcommittee were signatories to the Senate letter. This group included such conservative Senators as Trent Lott (R-MS), Ted Stevens (R-AK) and K. Bailey Hutchison (R-TX).

The change in political dynamic was clearly shown in the fact that no Republican members attended to the hearing to support Chairman Brownback's point of view. Subcommittee members had invited Dr. Irving Weissman, the Karel and Avice Beekhuis Professor of Cancer Biology and the Director of the Institute on Cancer and Stem Cell Research, to provide the counterpoint. Members of the Subcommittee in attendance

spent their time vigorously questioning witnesses espousing Chairman Brownback's view, and they relied on Dr. Weissman to explain the science.

Dr. Weissman testified about the value and potential of adult stem cell research but eloquently defended embryonic stem cell research against misguided efforts to ban certain forms of embryonic research. He called for changes to federal restrictions that severely limit public funding support. In imploring the Subcommittee Dr. Weissman stated, "I urge you to think hard about whether you wish to overrule good science and medicine and ban some kinds of biomedical research and therapies for the first time in American history...In my own personal moral view, those in a position of advice or authority who participate in the banning or enforced delays of biomedical research that could lead to the saving of lives and the amelioration of suffering are directly and morally responsible for the lives made worse or lost due to the ban." In conclusion Dr. Weissman testified, "If you have real concerns about our economy, or our ability to recruit and train the best and brightest for biomedicine, or our ability to develop and prescribe the best therapies for our patients, I believe you will choose the American way of sensible actions, and when appropriate, regulation, not abolition."

Subcommittee member Senator Ron Wyden (R-OR) hit directly on the conclusion of his fellow panelists in attendance when he stated, "While research shows that using adult stem cells can help some people, there are millions of Americans who suffer from a host of devastating diseases... who I believe deserve more."

Opportunities for a Clinical Research Scholarly Concentration

This Fall a new Scholarly Concentration in Clinical Research will be introduced into the Medical School Curriculum. Dr. Charles Prober, Professor of Pediatrics, Medicine and Microbiology & Immunology will serve as the course director. The overall mission of this new Scholarly Concentration will be to develop skills critical to the translation of scientific discoveries and knowledge into optimal patient care. Dr. Prober, who is also the Scientific Director for the Glaser Pediatric Research Network, has a passion for using acronyms to describe new programs – as he did when he helped develop the ACCESS and PRECEPT programs among others. Accordingly, he has described the new concentration under the banner of TRIUMPH (calling up images of a sleek motorcycle – to an older generation of course – or a cool sports car) but now standing for "Translational Research to Improve Understanding of Medicine and Patient Health" (aka TRIUMPH).

Dr. Prober and his colleagues note that students benefit from being knowledgeable about the principles that underpin clinical research since they also provide the skills to more critically evaluate purported advances in clinical care and provide a foundation for lifetime learning in clinical medicine. Moreover, clinical research is a dividend of the School's mission in Translating Discoveries (<http://medstrategicplan.stanford.edu/>) and clinical investigators are, in a number of ways, the translators that bring discovery from the laboratory to the patient.

The TRIUMPH curriculum will be comprised of both didactic course work and research experience. Among the courses will be “Epidemiology and Clinical Research Seminar” and “Introduction to Probability and Statistics for Epidemiology” among others. In addition, students will learn how to critically read and interpret the medical science literature and become conversant with evidence-based medicine. As with other Scholarly Concentrations, students will be able to pursue either a “Scholarly Track” or an “Original Research Track.” The preferred option is the original research track, which will engage the student in an in-depth hypothesis driven project involving data collection, analysis and reporting and which may also permit the student to gain a Masters Degree. As with other scholarly concentrations, it is expected that the student will be engaged with this work over a number of years.

This new scholarly concentration will join the current eight existing ones. Together they provide a reasonably broad set of offerings and opportunities for our students. They represent a great start although it is expected that there will be evolution of the scholarly concentrations based on their interest, opportunity and overall success.

Dr. Ron Levy on Discovery Channel

As you know, Dr. Ron Levy was recently honored for his pioneering work in developing immunological approaches to the treatment of cancer, focusing on non-Hodgkin’s lymphoma. His work has been widely celebrated and was recently featured on the Discovery Channel. If you missed that show and want to see the short video, click the following site:

<http://171.65.5.8/medhonors/DHC%20Medical%20Honors%20-%20Ron%20Levy.mpg>

Stanford Medical Students Selected for HHMI Training Fellowships

I am pleased to announce that six Stanford Medical Students have competed successfully for Howard Hughes Medical Institute Research Training Fellowships. The successful students and their research advisors include:

- **Kevin Forsythe** with Susan Knox (Radiation Oncology)
- **Oscar Gonazalez** with Philip Tsao (Medicine/Cardiovascular)
- **Holbrook Kohrt** with Peter Lee (Medicine/Hematology)
- **Mary-Elizabeth Muchmore** with Judith Shizuru (Medicine/Bone Marrow Transplant)
- **Matthew Siedhoff** with Michael Longaker (Plastic Surgery)
- **Leroy Sims** with Griffith Harsh (Neurosurgery)
-

In Memoriam: Stephanie Anne Franchak

Dr. Stephanie Ann Franchak joined the incoming class of pediatric interns at the Lucile Packard Children’s Hospital this June with the goal of becoming a provider of health care to children. As she began her internship it could not be imagined that she would soon become a patient and that her own illness, which sadly ended in her death on July 14th,

would leave an indelible mark on her colleagues and health care providers across the Stanford Medical Center in such a different way that she had anticipated. Sadly the promise of her own important personal contributions to improving the lives of others succumbed to a ravaging cancer that did not respond to the extraordinary efforts by physicians and other health care providers who tried so hard to help save her life. Many of these individuals came together for a Memorial Service on July 20th to reflect on Stephanie's life and the unique and special gifts that she brought to all she came to know. The tragedy of her untimely death was deeply felt by all – but her impact on the lives of the communities she embraced will surely live on.

Awards and Honors

Two world-renowned Stanford Faculty members are recipients of the 2004 Novartis Immunology Prizes that were awarded at the XIIth International Congress of Immunology on July 19th.

- **Dr. Hugh McDevitt**, Professor of Microbiology and Immunology and of Medicine, received the Clinical Immunology Prize for his discovery, mapping and characterization of major histocompatibility complex-linked control of the immune response.
- **Dr. Leonard Herzenberg**, Professor of Genetics, received a Special Immunology Prize for his development of the first Fluorescence-Activated Cell Sorter (FACS) and introduction of fluorescent labeled antibodies as reliable FACS reagents.

Congratulations to Drs. McDevitt and Herzenberg

Appointments and Promotions

- **Clarence Braddock** has been appointed to Associate Professor of Medicine at the Stanford University Medical Center, effective 7/1/2004 to 6/30/2009.
- **Eliza Chakravarty** has been appointed to Assistant Professor of Medicine (Immunology and Rheumatology) at the Stanford University Medical Center, effective 7/1/2004 to 6/30/2007.
- **Steven Chang** has been reappointed to Assistant Professor of Neurosurgery at the Stanford University Medical Center, effective 7/1/2004 to 6/30/2008.
- **Karl Deisseroth** has been appointed to Assistant Professor of Bioengineering and of Psychiatry and Behavioral Sciences, effective 1/1/2005 to 12/31/2008.
- **George Fisher** has been promoted to Associate Professor of Medicine (Oncology) at the Stanford University Medical Center, effective 7/1/2004 to 6/30/2009.
- **Pehr Harbury** has been promoted to Associate Professor of Biochemistry, effective 7/1/2004.
- **John Higgins** has been reappointed to Assistant Professor of Pathology at the Stanford University Medical Center, effective 7/1/2004 to 6/30/2008.
- **Sharon Hunt** has been reappointed to Professor of Medicine (Cardiovascular Medicine) at the Stanford University Medical Center, effective 7/1/2004.

- **Amreen Husain** has been reappointed to Assistant Professor of Obstetrics and Gynecology at the Stanford University Medical Center, effective 6/1/2005 to 5/31/2008.
- **Laura Johnston** has been reappointed to Assistant Professor of Medicine at the Stanford University Medical Center, effective 7/1/2004 to 6/30/2008.
- **Terence Ketter** has been promoted to Professor of Psychiatry and Behavioral Sciences, effective 7/1/2004.
- **Jonathan Katz** has been promoted to Associate Professor of Neurology and Neurological Sciences at the Palo Alto Veterans Affairs Health Care System, effective 7/1/2004 to 6/30/2009.
- **Jose Montoya** has been promoted to Associate Professor of Medicine (Infectious Diseases) at the Stanford University Medical Center, effective 7/1/2004 to 6/30/2009.
- **Matilde Nino-Murcia** has been promoted to Professor of Radiology at the Palo Alto Veterans Affairs Health Care System, effective 7/1/2004.
- **Robert Negrin** has been promoted to Professor of Medicine (Bone Marrow Transplantation), effective 7/1/2004.
- **Dmitri Petrov** has been reappointed to Assistant Professor of Biological Sciences, effective 7/1/2004 to 6/30/2007.
- **Stephen Quake** has been appointed to Professor of Bioengineering, effective 8/1/2004.
- **Clare Twist** has been reappointed to Assistant Professor of Pediatrics (Pediatric Hematology/Oncology) at the Lucile Salter Packard Children's Hospital, effective 6/1/2005 to 5/31/2007.

Dean's Newsletter

August 23, 2004

Appointment of Associate Vice President for Medical Development

As you know from prior communications, we are on the threshold of initiating the first phase of our capital campaign, for both the School of Medicine and Medical Center, as well as for the University. Indeed during the past couple of years we have developed an inventory of the key facilities and programs needed to further propel Stanford as leading research-intensive school of medicine and university into the 21st century. For the Medical School much of this will come under our umbrella of Translating Discoveries, the theme for our Strategic Plan (<http://medstrategicplan.stanford.edu/>). While it is certainly true that our faculty is the most critical component to the success of our fundraising efforts, it is also true that having an outstanding Office of Medical Development is also critically important.

During the past several months we have been engaged in a national search to identify the individual who could help lead and coordinate our development plans as the Associate Vice President for Medical Development. We worked with excellent search firm,

Witt/Kieffer, and had the opportunity to evaluate a large number of potential candidates. Indeed, our group of finalists was truly outstanding – each bringing different and special strengths and talents to this position. Our search committee included Martha Marsh, CEO of Stanford Hospital & Clinics, John Ford, Vice President for Development, Mike Hindery, Senior Associate Dean for Finance and Administration, John Freidenrich, University Trustee and Chair of our Leadership Council for Medical Development and myself. During the final interview sessions we also benefited from the assistance and insights of senior faculty and university leaders who met with each of the candidates. The input we received was most helpful.

Last Monday, John Ford, Martha Marsh, and I were very pleased to announce the appointment of Douglas G. Stewart as Associate Vice President for Medical Development and Alumni Affairs at the Stanford University Medical Center.

Doug will begin his new responsibilities on October 1st. He comes to Stanford from the University of California, San Francisco, where he served as Executive Director, University Development, and Associate Vice President for the UCSF Foundation. Importantly, he directed UCSF's most recent successful comprehensive fundraising campaign, which just surpassed its goal of \$1.4 billion a year early. Prior to going to UCSF, Doug directed fundraising activities for the California State University at Fullerton, the California Academy of Mathematics and Sciences, and Neurosciences at the University of California, Los Angeles. His experiences in leading these campaigns as well as his abilities as a manager, leader and fundraiser, will surely prove most valuable to Stanford as we move forward.

As Associate Vice President, Doug will lead the School's Office of Medical Development. He will work closely with Martha Marsh and me as well as with the leadership of the University's Office of Development in all aspects of fundraising for the School of Medicine and the Stanford Hospital and Clinics. We are extremely pleased that Doug will be coming to Stanford. I also want to thank Jana Baldwin (Administrative Associate) and Julia Tussing (Managing Director, Finance & Administration) who played key roles in coordinating the visits of our candidates and making each feel welcome to Stanford.

For those readers unfamiliar with the work of the Office of Medical Development, let me say that it provides support for Stanford University Medical Center by building long-lasting relationships with patients, businesses, foundations, medical school alumni, and members of the community. These relationships help enhance the groundbreaking work of physicians and scientists throughout the medical center - from the discoveries they make to the patient care they deliver - and provide a sense of involvement and fulfillment for donors, volunteers, and staff. The Office plays a crucial role in the work of the Stanford University Medical Center, and I couldn't be more pleased that we have someone of Doug Stewart's experience and talent to lead our development efforts.

Update on the School of Medicine Website Project

At the August 6th meeting of the Executive Committee, Michael Halaas, the Systems Development Associate Director of Web Development in the Office of Information Resources and Technology (IRT), presented a report on the School's public web site.

As you likely know, in January 2004, the school launched its newly designed web site including a new home page and several thousand pages of associated content. The primary goal was to create a site that can provide meaningful, usable information and services to the school's core audiences and appropriately represent the spirit and stature of our institution. Michael emphasized that the redesigned site was not simply a cosmetic upgrade, but a complete re-implementation of the web infrastructure from both a technical and a conceptual standpoint. I think that Michael and his colleagues, under the leadership of Dr. Henry Lowe, Senior Associate Dean for Information Resources and Technology, have done an outstanding job in making our website easy to navigate and highly informative.

The new website (<http://med.stanford.edu/>) has proven to be a heavily used resource for the school, accumulating 1.9 million unique visitors between January and June of 2004 with an average of 92,000 page views each day. 15% of visitors to the site were from Stanford, 30% were from elsewhere in California, 33% were from elsewhere in the US, and 22% were international.

Michael also provided an exciting update on the status of the redesign project and showed examples of completed pages. The ultimate goal is to build all sites in the school using a common design framework. It was emphasized that this design uses many common elements but is flexible in order to accommodate the unique needs of each site. To date, 49% of the web sites that the project team is aware of have been completed. An additional 8% are in development, and the remaining are still to be done. Among the benefits of the redesign are a more attractive presentation, improved organization, better navigation, more dynamic content, a unified presentation of the school's departments and other entities, and improved support for departmental web maintainers.

Michael also demonstrated and gave an update on the status of two dynamic web projects: the *Community Academic Profiles (CAP)* and the *Public Clinical Trials Directory*. The *Community Academic Profiles (CAP)*, in Phase 1 of the project, will be a replacement for the Faculty Research Directory that is currently online. It will automatically generate profiles for all Principle Investigators in the School. These profiles will be easy for researchers (or their designees) to update and can be published on multiple school sites simultaneously. Information about all publications associated with our researchers will be automatically retrieved from PubMed and incorporated into profiles. The site is scheduled for release in September with continued development and enhancements planned for the future.

The *Public Clinical Trials Directory* is built as a searchable repository for all clinical trials in the school. It has been developed in partnership with many groups in the school and hospitals and is being piloted by the Cancer Clinical Trials Office. The site organizes the trials by disease category and school department and provides basic information and a

primary contact for each trial. Maintenance of trial information is delegated to study coordinators and PI's. If your department would like to begin using the system, please contact Michael at halaas@stanford.edu. The site can be viewed at http://med.stanford.edu/clinical_trials/

The members of the Executive Committee expressed their appreciation for the redesigned site and for the extensive efforts of the many staff members who have worked on its various components. I would add that thanks to Michael and his group. We truly have an outstanding website – which promises to become only better in the months and years ahead.

Update on the Department of Psychiatry

At the August 20th meeting of the Executive Committee, Dr. Alan Schatzberg, Kenneth T. Norris Jr. Professor and Chair of the Department of Psychiatry and Behavioral Sciences, presented an overview of his department's activities. Unfortunately, I was away for this presentation and thank Kathy Gillam for this summary. Per her report, Dr. Schatzberg began by pointing out that the discipline of psychiatry has changed enormously since the era when the image one had of psychiatry was the couch in the psychoanalyst's office. Today it is heavily pharmacologically oriented, with strong elements of molecular biology, radiology, and genetics. Indeed, I would add that I very much see psychiatry as being embraced in the domain of our Neurosciences Institute at Stanford.

The department currently consists of some 92 faculty and clinician educators, 27 academic research staff, 57 residents, 84 fellows, and 350 other employees. It has over 40,000 clinic visits annually and projects that it will have over \$28M in sponsored project expenditures by the end of FY 2004. The department, as is typical of Stanford departments, is smaller than its peers, so that it brings in less total grant support than they. However, like the School of Medicine as a whole, it ranks at the top in terms of grant support per faculty member.

The department is historically multidisciplinary, in part because it encompasses both psychiatry and behavioral sciences. The academic disciplines represented in the department include animal behavior, brain imaging, epidemiology, genetics and pharmacogenetics, health outcomes research, molecular and cellular physiology, molecular pharmacology, neuropsychology, psychology (psychotherapy), psychoneuroendocrinology, psychopharmacology, sleep medicine, and statistics. The department is also involved in major collaborations with many departments both within the School of Medicine and in other schools, such as Biological Sciences, Psychology, Bioengineering, and Electrical Engineering.

The major research programs within the department are child psychiatry, eating disorders, geriatric psychiatry, mood disorders, the Pritzker Laboratory, psychosocial research, and sleep disorders, including narcolepsy. For each program, Dr. Schatzberg provided a brief synopsis of current research and recent findings. He emphasized the novel approaches being used in each of the areas. In its research, training, and patient

care, the department covers most of the major psychiatric illnesses. Research on them is carried out using a variety of disciplines and methodologies, beginning with basic animal models and other basic research and encompassing epidemiology, clinical biology, psychopharmacology, and psychotherapy.

Following the presentation, the members of the Executive Committee commented on the broad based transformation the department has undergone under Dr. Schatzberg's leadership and on the close connections between the department and the neurosciences institute. Thanks to Dr. Schatzberg for his informative and engaging presentation and to all the members of the Department of Psychiatry and Behavioral Sciences for their many contributions.

A Timely Article about Stem Cells

Today's Washington Post presented an op-ed article by Ruth R. Faden and John D. Gearhart. Dr. Faden, Wagley Professor of Biomedical Ethics at Johns Hopkins University, directs its Berman Bioethics Institute. Dr. Gearhart is the C. Michael Armstrong Professor, also at Johns Hopkins University. In my opinion they present a clear, balanced and articulate perspective, which I am taking the liberty of including in this issue of the Dean's Newsletter for your information.

Facts on Stem Cells

By Ruth R. Faden and John D. Gearhart

Reprinted from the Washington Post, Monday, August 23, 2004; Page A15

This summer marks the third anniversary of President Bush's announcement of his policy on stem cell research. In the intervening years, the subject has become a polarizing flash point for American politics and a focal point for the presidential campaign. For many of Sen. John Kerry's supporters, the Bush administration's stem cell policy is a leading symbol of everything that is wrong with the current domestic agenda. For Bush supporters, his stance on stem cells is a leading symbol of all that is right.

Translating science into political symbols and slogans comes at a price. There is hype on both sides. In the rush to put a human face on a complicated biomedical challenge, supporters of both stem cell research and Kerry sometimes seem to suggest that but for the administration's policy, stem cell cures for dread diseases would already be in hand. Even under the most supportive policies, however, considerable research needs to be done before the therapeutic promise of stem cells is fully understood and its benefits are realized. In no cases are cures guaranteed, and even in the most promising areas, reliable cures are years, in some cases as much as five to 10 years, away.

That said, and despite the hype to the contrary, there is no question that the current policy is substantially retarding progress in stem cell research. In an Aug. 4 op-ed in The Post, Anne Applebaum argues that our national debate on stem cells should begin with the facts. We agree. Here are some facts:

* As much as we might wish it to be otherwise, no non-embryonic sources of stem cells -- not stem cells from cord blood or from any "adult" sources -- have been shown to have anything like the potential to lead us to viable treatments for such diseases as juvenile diabetes, Parkinson's and spinal cord injury that stem cells derived from very early embryos do. The science here is unequivocal: Access to embryonic stem cell lines is essential to rapid progress in stem cell research.

* The embryonic stem cell lines the president approved for federal funding three years ago, all of which were derived before August 2001, are clearly inadequate to advance stem cell science, let alone to take that science from the bench to the bedside. There are too few of them, no more than 21. All of the approved stem cell lines were prepared using mouse cells and thus pose a risk of contaminating human subjects with mouse viruses. This is a needless risk; since 2001 we have developed techniques for establishing embryonic stem cell lines without using mouse cells. Even if the approved lines were safe for use in humans, many patients who would be appropriate and willing participants in the first human trials would have difficulty receiving grafts based on these lines because of problems of genetic matching. There are just too few lines to even begin to accommodate the genetic diversity in our population.

* Under the current policy, it is not possible to use federal funding to generate or study stem cells derived from embryos with genetic defects or disease genes. Such cell lines would be invaluable in helping to determine the molecular basis of disease and in seeking ways to correct problems or ameliorate their consequences.

* Restricting federal funding to just the approved lines is retarding progress for financial as well as scientific reasons. The \$25 million allocated by the Bush administration for embryonic stem cell research in 2003 is a tiny fraction of the National Institutes of Health budget of \$18.3 billion for extramural research. To put this in perspective, in that same year the government spent almost eight times as much (\$190.7 million) on research with less promising "adult" stem cells. There are formidable scientific and medical challenges to attaining our goal of providing cell-based therapies that are safe and effective. It will take the efforts of many scientists and clinicians in a variety of disciplines to bring this technology to the clinic. The results of laboratory investigations on human embryonic stem cells are highly encouraging and consistent with meeting this goal. Private funding of stem cell research is important and is increasingly forthcoming, but in these early stages, federal funding is paramount and essential.

* We are losing ground to other countries with less restrictive policies on embryonic stem cells. This month British government officials announced the first license to use cloning techniques to generate a human embryo to produce stem cells that might be used for the treatment of disease. Other nations are investing heavily -- hundreds of millions of dollars -- in embryonic stem cell research. The United States stands to lose substantially in the global economy of intellectual property and biotechnology. More important, patients everywhere stand to lose. As much as other countries invest, they cannot fill the gap. They are not as well positioned scientifically as the United States to advance stem cell research. Losing ground to other countries also means losing oversight of critical points in the research cycle, over the ethical treatment of human subjects and embryos, and over quality control.

Hype and symbols will not advance our national debate about stem cell research. Facts and frankness will. So let's be frank.

The controversy about stem cells, and the choice between Kerry and Bush on stem cell policy, is not about science; it really is about values -- moral values.

The science is clear. The only way to ensure that we realize the promise of stem cell research as quickly as possible is to permit federal funding to be used to create new embryonic stem cell lines and to support research with new lines. President Bush's values are also clear. He believes that the destruction of embryos can never be morally justified, no matter how much human suffering might be alleviated, even if the embryos are only still a clump of cells not visible to the human eye and even if the embryos will be destroyed in any event in fertility clinics where they are no longer needed.

We believe that most Americans have different moral values from the president's. While we recognize and respect embryos as early forms of human life, we do not believe that embryos in a dish have the same moral status as children and adults. We believe that the obligation to relieve human suffering binds us all and justifies the instrumental use of early embryonic life. And we believe that it is possible to draw morally relevant lines and to enforce them as a matter of national policy.

Hype and symbols aside, the choice is clear.

Victory in the Jung Lawsuit Regarding the Intern Match

As many of you know, the last couple of years have been marked by a controversial and contentious lawsuit by Jung and colleagues that has threatened the future of the Intern Match program. Stanford Hospital was named in the suit, along with a number of other teaching hospitals across the nation, and university and hospital leaders have been quite involved in this process. On August 12th, however, US District Court Judge Paul

Friedman granted the defendants' motions to dismiss the plaintiffs' case due to the passage of the Match statute by the Congress in support of the Match. This dismissal helps assure the integrity of the Intern Match and further protects teaching hospitals from costs of antitrust litigation against the Match. I think this is excellent news for American medicine and graduate medical education.

Town Hall Meeting on Staff Diversity

Mike Hindery, the Senior Associate Dean for Finance and Administration, will be hosting a Town Hall Meeting at noon on September 8th to discuss diversity and inclusiveness issues affecting staff. Diversity and inclusiveness programs are a major component of our recruiting efforts, for faculty, staff, and students, and discussions among colleagues across the School help to move these programs forward.

I commented on diversity programs in my May 31, 2004 Newsletter, stating that, "While the progress made in enhancing medical and graduate student education is important and encouraging, we also have considerable work to do in recruiting and retaining minority faculty and staff. This will be a major initiative and I will be following up on this discussion throughout the year. Indeed, it will feature prominently in our Leadership Retreat next January as well as in a new program in leadership development within the School. It will also (receive) oversight from the Office of the Dean to help make sure that we are doing all we can to enhance and improve diversity within the School of Medicine." The town hall meeting Mike Hindery is holding is a continuation of the effort to enhance diversity and inclusiveness across the School.

We encourage all members of the School of Medicine community to support the School of Medicine's efforts in this regard, including efforts to encourage qualified individuals who would bring diversity to our workforce to apply at Stanford, and by suggesting ideas for broadening our outreach efforts so as to increase the number of women and minorities in our applicant pools, and by working to make every member of the School community feel included.

Sandwiches and drinks will be provided; please RSVP to amy.erickson@stanford.edu. The location of the meeting will be announced by email.

Awards and Honors

- ***Dr. William Dement***, Lowell W. and Josephine Q Berry Professor of Psychiatry and Behavioral Sciences, has been selected by the Society for Neuroscience as "one of the great brains of our time." Admittedly, this certainly stands as a most impressive honor and designation. Congratulations to Dr. Dement for all of his outstanding work on sleep and its disorders.

- **Dr. Sarah Donaldson**, Catharine and Howard Avery Professor of Radiation Oncology, has been elected Secretary/Treasurer of the American College of Radiology. This appointment exemplifies Dr. Donaldson's dedication to service at all levels in the field of radiology. Congratulations to Dr. Donaldson for being an outstanding role model for all faculty.
- **Dr. Alice Whittemore**, Professor of Health Research and Policy, has been named the recipient of this year's Janet L. Norwood Award for outstanding achievement by a woman in the statistical sciences. The Award is presented by the Department of Biostatistics and the Section on Statistical Genetics in the School of Public Health at the University of Alabama at Birmingham. The award will be presented at a ceremony on October 15th at UAB. Congratulations to Dr. Whittemore for this wonderful honor.

Appointments and Promotions

- **Lawrence Goodnough** has been appointed to Professor of Pathology at the Stanford University Medical Center, effective 9/1/2004.
- **Peter Koltai** has been appointed to Professor of Otolaryngology and Professor, by courtesy, of Pediatrics at the Stanford University Medical Center, effective 9/1/2004 to 8/31/2009.
- **George Yang** has been promoted to Assistant Professor of Surgery at the Palo Alto Veterans Affairs Health Care System, effective 8/1/2004 to 7/31/2007.

Dean's Newsletter September 7, 2004

Our New First Year Medical Students Arrive

The rhythms that define our academic world are the arrival of new students, their personal and professional development and their graduation to commence new challenges and opportunities bearing the imprimatur of the Stanford University School of Medicine. On Monday, August 30th we officially welcomed our new incoming class of medical students. With the New Stanford Curriculum that began last year, our medical students start earlier than the rest of the university in order to accommodate all of the exciting changes that now constitute their new learning pathway. Our incoming graduate students will arrive in mid-September. This was the week to launch our new medical student class.

As with past years, our incoming class of 86 medical students is a highly selected and diversified group. According to Dr. Gabriel Garcia, Director of Admissions, 5336

applications were received. From these, 484 students were selected for interviews and 165 were offered admission. Our incoming class of 86 includes 73 of those admitted and 13 students who had deferred from prior years. As with prior classes, the incoming class has superb academic accomplishments, and 21 of the 86 students have advanced degrees (18 Masters of Arts or Science and three PhDs). The average age of the incoming class is 24 years (range 20-34). Women make up 46% of the class (which is less than the greater than 50% proportion that has characterized classes back to 1997). The class is also quite diverse; 24% are new Americans and 23% are underrepresented in medicine minorities. While 15 of the incoming class did their undergraduate work at Stanford and seven at UCLA, the remainder came from some 44 colleges and universities.

Our new students spent the early part of the week learning about Stanford and medicine including the resources available to help promote and safeguard their personal and professional lives and development. They had the opportunity to meet with their Faculty Advisors, learn about the New Stanford Curriculum and meet the course directors of the topics they will cover in the first quarter, which include Gross Anatomy, Cells to Tissues, Molecular Foundations of Medicine and Genetics. They also learned more about the community activities they might engage in as well as the underpinnings of professionalism and the practice of medicine in a multicultural society.

The orientation culminated in a festive dinner for our students and family members and guests who were able to attend the Stethoscope Ceremony. This event is supported by the Stanford Medical Alumni Association and represents a wonderful tradition. In most every medical school, new students participate in a “white coat ceremony” to mark their entrance into the medical profession. For some years Stanford has given stethoscopes rather than white coats – something that I believe represents special symbolism and values. While there is no doubt that a white coat does evidence a physician it can also symbolize something that separates the physician from the patient. In contrast, the stethoscope is something that connects the physician to her or his patient, allowing them to listen and make human contact – which after all is what should truly characterize the physician.

With orientation completed, our new students officially began classes on Thursday, September 2nd. I want to welcome them again to the Stanford family and encourage them to work hard to develop all of their knowledge and skills so that they can best serve patients, science and society.

The Stem Cell Debate

During the past three years the controversies surrounding stem cell research and especially embryonic stem cell research has engendered strong reactions, in some ways pitting science against religion. Stanford has played a leading role in stem cell research and its related controversies. A number of our scientists have contributed fundamental and major discoveries, while others have participated actively in the dialogue around ethics, politics and religion. Our founding of the Stanford Institute for Cancer and Stem Cell Biology and Medicine, made possible by a very generous contribution from an

anonymous donor, has put Stanford in the forefront and has stimulated other institutions to follow our lead (e.g., witness Harvard's recent institutional commitment to stem cell research). Importantly, the stem cell debate is likely to feature prominently in this November's presidential campaign and election as evidenced by the continuing stream of editorials, op-ed pieces and even a cover story in the August 31st issue of the Wall Street Journal on "How Stem Cells Became a Hurdle for GOP Campaign". In California, stem cell research will be of particular interest because of Proposition 71. This proposition which will be on the ballot, offers the opportunity for considerable funding and support for stem cell research.

I fully recognize that the issue of stem cell research evokes strong feelings in people for a variety of reasons. As a School of Medicine, we are committed to do the best research possible in an impeccably ethical manner. We are also committed to educate each other as well as the public. Accordingly, the fall issue of Stanford Medicine will be virtually entirely devoted to stem cell research and will provide a highly balanced review of the issues – including the science as well as the ethics and the related issues that characterize the current controversy. This important issue will be available in the next couple of weeks and I encourage you to read it carefully.

Stanford Successful in NIH Interdisciplinary Award Competition

The National Human Genome Research Institute at the NIH, announced on Tuesday that it would award grants totaling about \$20 million to four universities to support interdisciplinary centers devoted to studying the ethical, legal, and social issues raised by genetic and genomic research. I am most pleased to inform you that Dr. Mildred Cho and her colleagues, on behalf of Stanford University's Center for Integration of Research on Genetics and Ethics, will receive \$3.8 million to study the ethical, legal, and social consequences of uncovering genomic factors that may contribute to behavioral and neurological conditions. The other successful universities were Case Western Reserve, Duke and the University of Washington. The grants will be over five years, and will support the work of scholars in fields outside the disciplines of genetics and genomics, such as the behavioral and social sciences, clinical research, theology, public policy, and law. Congratulations to Dr. Cho and her colleagues and collaborators.

Stanford Medicine Fundraising 2004

According to Martin Shell, Associate Vice President for University Development, Stanford achieved its second best year of fundraising, based on the figures that became available with the close of the fiscal year on August 31st. For the University as a whole, total gift receipts for the past year totaled \$529,130,062 – a remarkable figure that reflects the hard work of many and the enormous generosity of our community. The School of Medicine's totals came in at \$98,747,444, which was at the same level as FY03. Given all the changes we have faced in our Office of Medical Development during the past year, this is a remarkable accomplishment indeed. I would like to thank all of our OMD staff and faculty who have worked hard to secure gifts and foundation awards. I particularly want to acknowledge the efforts of Patricia McLeod, who served as interim director of

the Office of Medical Development; David Glen, who returned from retirement to provide assistance during this transitional period; and John Ford, VP for University Development and our colleagues across the campus. As mentioned in my last Dean's Newsletter, we have been successful in recruiting Doug Stewart as our new AVP for Medical Development. Doug will be joining us on October 1st. While the opportunities before us are boundless, the hard work of our current staff and faculty have resulted in a great base to move forward from. Again, thanks to all – and especially to the wonderful donors who support our work.

Stanford Hospital & Clinics 2004

In striking contrast to just three years ago, when the consequences of the Stanford-UCSF merger and then de-merger, among other factors, virtually devastated the financial performances of Stanford Hospital and Clinics, the picture is amazingly different today. On Tuesday August 31st, the Hospital's Board of Directors meeting reviewed data that showed SHC end of the year performance to be quite healthy. This is certainly good news for the Medical Center, especially when it is to be added to the very solid performance of the Lucile Packard Children's Hospital as well. There are a number of reasons for this. Certainly new leadership, improved financial systems, better contracts and improvements in quality and service have all made a significant difference. But certainly among the most important reasons for the improved success of both the inpatient and ambulatory services at SHC is the hard work of our faculty in each of the clinical departments. This includes the improved productivity of our faculty as well as the contributions from the various new recruits who have joined the Stanford clinical services during the past several years. Because of their efforts, clinical volumes and discharges are up, ambulatory clinics are busier and the operating rooms and various ancillary services are moving to peak performance. While there are still many challenges ahead, given the dynamic changes that continue to unfold in the cycles of health care (between payers, providers and consumers) it is certainly worth celebrating the success of the moment. In doing so, I want to thank, in particular, our clinical staff and faculty who have made such an important impact on the health of both SHC and LPCH. Thank you.

Announcing the Stanford Center for Clinical Informatics

On September 1, 2004, Stanford University School of Medicine created a new academic entity called the Stanford Center for Clinical Informatics (SCCI). The core mission of the center is to foster the development of an interdisciplinary academic program focused on novel applications of information technology and computer science to health care, translational and clinical research, biomedical knowledge management and education. The SCCI will emphasize applied informatics, with the goal of contributing to the development of world-class information technology solutions supporting human health. The SCCI will be directed by Dr. Henry Lowe, Associate Professor of Medicine and Senior Associate Dean for Information Resources and Technology at the School.

Clinical Informatics is the scientific discipline that aims to enhance human health by developing novel information technology, computer science and knowledge management

methodologies to prevent disease, deliver more efficient and safer patient care, increase the effectiveness of translational research, improve knowledge access and facilitate technology-enhanced education. It is truly an interdisciplinary field, involving clinicians, biomedical and computational scientists, knowledge management professionals, educators and healthcare consumers.

A key focus of the center's academic activities will be the Electronic Health Record (EHR). Healthcare is an intensely data-driven discipline. However, even today, most of the information used as part of the patient care process is paper-based. Important health information about individuals is scattered across many systems that do not, and cannot, communicate with each other. New national and international initiatives aim to define and implement a secure, patient-centric, longitudinal electronic health record that will store an individual's past and present health status, care received and plan of care, and that can be appropriately shared to improve health outcomes and enhance patient safety. Equally important as a focus will be how the EHR can support the development of evidence-based medicine through clinical and outcomes-based research, while ensuring the security and privacy of individual patient information.

Technology alone will not achieve the promise of Clinical Informatics. Complex legal, economic, human factors and societal issues must be addressed if information technology is successful in improving human health. To ensure that these important areas are addressed, the SSCI will strongly encourage active participation from across the University, from the business sector and from the community at large. The SSCI will support the advancement of the field of Clinical Informatics by fostering multidisciplinary research programs, building industry-academic partnerships, hosting seminars and conferences, working with faculty to design undergraduate and post-graduate courses, developing internship opportunities, acting as an information resource and participating in global efforts to improve human health using information technology. Beginning in October 2004 membership in the SSCI will be open to all faculty, staff and students at Stanford University and its affiliated hospitals.

Moving to an Electronic IRB System

Electronic systems are not only transforming health care delivery, they are also impacting virtually every facet of our academic medical center. Of note, Stanford University received NIH funding to develop an electronic IRB protocol application system that will allow for the online submission, review, routing, and tracking of human subjects research protocols. The first phase of this project is nearing completion. An electronic IRB system is already operational at the University of California at San Diego.

The current module supports the submission of "Regular and Expedited New" protocols. At this point in the electronic development, we are not yet able to process Revisions, Renewals, Reports, and Exempt protocols.

Please contact Ammy Hill in the Information Technology Systems and Services Department to set up a short training session to submit your next new protocol,

electronically (ammyh@stanford.edu or call 725-6231). To access the electronic system, see: <http://hs.stanford.edu>. For information and job aids on submitting through the electronic system, see: <http://humansubjects.stanford.edu/education/jobaids>

Task Force to Address Ways of Expediting the Faculty Appointments and Promotions is Launched

On Friday September 3rd, the first meeting of a Task Force on Faculty Appointments and Promotions was held to initiate an important effort to streamline as well make more functional our process for academic appointment and promotion. The bottom line is that it simply takes too long to recruit and appoint new faculty members and to promote existing faculty. The current systems are too laborious and cumbersome and evoke multiple impediments or problems. It is my hope that this Task Force, benefiting from some reports dating back to 1999, can implement processes that are much more sophisticated, ideally taking advantage of electronic reporting, and that permit the evaluation system to be done fairly and with greater integrity and speed. The Task Force is chaired by Dr. Rob Jackler, Professor and Chair of the Department of Otolaryngology-Head & Neck Surgery, and includes members from the faculty and staff who provide broad perspective and expertise. These include Brian David, DFA, Department of Surgery; Sarah Donaldson, Catherine and Howard Avery Professor in the Department of Radiation Oncology; Jason Irwin, Operations Manager, Department of Otolaryngology; Linda McLaughlin, Assistant Dean for Academic Affairs; Julie Mosely, Manager, Organizational Development; Rick Myers, Stanford W. Asherman Professor Genetics; Annelies Ransome, Faculty Affairs, Administrator, Department of Medicine; Channing Robertson, Ruth G. and William K. Bowes Professor of Chemical Engineering and Associate Dean for Academic Affairs, School of Engineering; Kim Thomas, Faculty Affairs Administrator, Psychiatry and Behavioral Sciences; Scott Walters, Faculty Affairs Administrator, Department of Medicine. Kathy Gillam, Special Assistant to the Dean, will serve as Staff to the Task Force.

The Committee plans to make a progress report to the Dean by November and is aiming to complete its work by the first quarter of 2005. This is an enormously important project and I am hopeful that this Task Force will have a major impact. That is certainly my intent. Obviously details will follow.

New Lane Library Website

According to Debbie Ketchell, Associate Dean of Knowledge Management and Director, Lane Medical Library, the recent launch of the new web site by the Lane Medical Library & Knowledge Management Center is another step towards realizing our vision of a digital library available anytime and anywhere. It leverages our investment in online journals, books, reference, images, and other knowledge content through several new features.

Go to: <http://lane.stanford.edu/index.html> and discover easier off-campus access by SUNetID authentication; a single search for online books, journals, databases, and more;

an article finder and new PubMed@Stanford links that connect you to more online journals than ever; and new clinical and research portals that include customized meta-searches across multiple reference sources.

Tabs across the top of the Lane Library Home Page offer five customized portals focused for clinicians, researchers, students, instructors and patients. The most popular resources such as PubMed remain as quick link buttons. The Clinician and Researcher portals offer a new “meta-search” that allows you to simultaneously search across multiple clinical or research databases and references repositories rather than going to each individually. The Clinical Core search queries UpToDate, SkolarMD, PubMed, Harrison’s, imagesMD, Micromedex, patient handouts and more. The BioResearch search queries PubMed, Entrez, OMIM, BIOSIS, SciSearch, Current Protocols, Protocols Online, and Methods in Enzymology. More search sources and tailored cores are planned in the future. Another future development is an “instructional hub” that brings together the “extra” curriculum across postdoctoral and fellowship programs in finding and manipulating information.

Per Debbie Ketchell, the Lane Library front page also keeps you abreast of the rapid changes in text content and services. A handy search box offers a drop-down menu of source options to search, including PubMed, e-Journals, the Lane catalog, Stanford. Who, Goggle and more. Choose eResources if you want to search for online biomedical journals, books, databases, and selected websites. A new Article Finder search, found on the eJournals page, makes it easy to discover the availability of online articles in biomedicine and beyond. For example, if you are looking for an opinion piece on medicine in a recent issue of the New Yorker, fill out the journal title and the article title and you’ll find it. Article Finder includes titles outside biomedicine license by other campus libraries. If there is no online available, Article Finder will check print holdings or offer an interlibrary loan form. Access to restricted access content from off-campus has been simplified to your SUNetID. Enter it once and all future requests for authentication during your browser session will take place seamlessly behind the scenes. Article Finder is now embedded in PubMed@Stanford, which connects you to many more online journals than our previous version. Be sure to use the PubMed@Stanford link rather than the generic PubMed URL to see all these direct article links.

The new library website foreshadows the customization, simplified access and smart searching that will be the hallmark of our knowledge management in the future. You can contact your library liaison for a personal guided tour for your faculty, students or staff. The link for your departmental liaison is also on the Lane Library front page.

I want to thank Debbie Ketchell and her staff for making these important and exciting changes.

Thanking Valerie (Su) Mersh

On Tuesday, August 31st, a retirement celebration was held in the Lane Medical Library Courtyard to honor Valerie (Su) Mersh for her nearly 25 years of service to Lane and the School of Medicine. As Deputy Director and Head of Public Service Valerie made

significant and enduring contributions and won the respect of her colleagues both in the library and throughout the School. I too want to thank Valerie and wish her well in her retirement.

New Members of the Office of Graduate and Postdoctoral Education

During the last weeks several changes have taken place in the office of graduate education and postdoctoral affairs. Kimberly Griffin, Director of Bioscience Diversity Programs, returned to graduate school to pursue a Ph.D. in the School of Education at UCLA. During the time that she was with us, Kimberly did an outstanding job in enhancing and expanding the diversity program for graduate students. Her energy and enthusiasm was boundless and her accomplishments notable indeed. She certainly deserves all of our thanks – and best wishes for her own future academic success. At the same time, we are very fortunate to have recruited Anika Green to continued to build on Kimberly's work. A native Californian, Anika has been a key player in the Meyerhoff Scholarship Program at the University of Maryland, Baltimore County. There, she worked to enhance the recruitment and retention of undergraduate students studying science, technology, engineering, and mathematics and helped them move on to graduate study in those areas. Her office is in M105; phone 724-2815; email agreen1@stanford.edu.

In the Office of Postdoctoral Affairs, we have been engaged in a major, national search for a replacement for Michael Cowan who retired from that office some months ago. Chequeta Allen from the University of Southern California has been recruited to take on the leadership of that office as Assistant Dean of Postdoctoral Affairs. Chequeta holds an MBA and MPHE and has extensive experience in leadership positions in the academic environment and especially schools of medicine (e.g., the Medical College of Virginia and University of Tennessee College of Medicine). Most recently, she served as Executive Administrator, Pediatrics & Academic Affairs at the Children's Hospital of Los Angeles while also holding the position of Visiting Assistant Professor of Clinical Pediatrics in the Division of Research on Children, Youth and Families in the Department of Pediatrics at USC. Her combined experience in the teaching, research and clinical settings of academic medical centers makes her extremely well equipped for her new leadership role in the OPA. Her office location is CCSR Suite 4235; phone 725-5075; email challen3@stanford.edu.

The third new position is the Director of the recently established Career Center in the School of Medicine. This office will be dedicated to assisting graduate students and post-doctoral fellows in identifying the career path that best meets their individual interests and then landing the best position possible. We are very fortunate to have attracted Michael Alvarez to fill this position. Michael's professional work experience of more than 12 years spans both business and academic settings, and includes coaching and advising graduate students at Boston College, management consulting as part of Andersen Consulting's NYC practice and founding and directing the development of a career center serving all schools and disciplines at UCSF's health science campus. Michael has BS and MS degrees in Psychology. In his capacity as Director, Michael will

assemble and develop career-related resources, initiate and formalize relationships with prospective employers across a wide range of industries and sectors, and provide individualized career development advising, support, and counsel to our graduate students & postdocs. His office location is CCSR Suite 4235; phone 723-2035; email michael.alvarez@stanford.edu

Welcome to Anika Green, Chequeta Allen and Michael Alvarez.

Honoring Dr. Tom Merigan

On Friday, August 27th a Festschrift was held to honor the life and career of Dr. Tom Merigan, the George E. and Lucy Becker Professor of Medicine. Dr. Merigan has been a leading and distinguished member of the Stanford School of Medicine for nearly four decades. His accomplishments have been far ranging and have made him one of the most cited scientists at Stanford. They have included his work on the interferons, viral pathogenesis, antiviral therapy, and, perhaps most notably, his leadership in AIDS research. The Festschrift entitled “Bridging Generations: Toward an Understanding of Infectious Disease Pathogenesis” was attended by a litany of luminaries in virology including a number of Dr. Merigan’s trainees. It was a wonderful event and featured wonderful science as well as great fanfare.

Having known of Dr. Merigan’s work and contributions for many years before I arrived at Stanford, I too want to add my praise and admiration for his many, many contributions – as a researcher and as a mentor. Well done!

In Memoriam: Dr. Bruce Stoker

Bruce A.D. Stocker, M.D., Professor Emeritus Active, Microbiology and Immunology, died August 30, 2004 at the age of 87. Drs. Leon Rosenberg and Gary Schoolnik, colleagues of Dr. Stoker, have informed me that he worked actively in his laboratory until three months before his death pursuing scientific questions he had first begun to study in the early 1950’s. Following medical school and a stint with the British Army in India, he undertook a life-long study of Salmonella which culminated in a series of elegant reports describing how bacterial flagella work, how their expression is regulated, their relationship to virulence, and ultimately, how they can be used to construct living attenuated vaccines for the prevention of a variety of human and animal infections and cancers.

On a more personal note, Dr. Schoolnik has offered the following reflection “Bruce was as pure a scientist as I have yet encountered. He pursued science without concern for personal fame or money. He was ruthlessly objective. He stayed with the same basic question for over half a century--taking it to deeper levels. His brilliance, which did not shine quite so brightly recently (some of you may have joined the lab too recently to have experienced it), was clear to all of us who knew him for a longer time and from his original contributions. Please keep in mind his values, which are unfortunately not so common today, even in academia. I believe they are the right values. Please also reflect on what it means to age as a scientist and, as Bruce demonstrated, the ability of scientific

investigation to sustain intellectual growth and an active life even into the ninth decade”.

There will be a memorial service for Dr Stoker on September 19th at 2:00 pm at the Stanford Faculty Club. A lectureship in microbial pathogenesis is being established to honor the memory of Dr. Stocker at the School of Medicine. Memorial gifts to the lectureship may be sent to the Office of Medical Development, Stanford University Medical Center, 2700 Sand Hill Road, Menlo Park, CA 94025, and checks should be made payable to "Stanford University”.

Appointments and Promotions

- **Victor Henderson** has been appointed as Professor of Health Research and Policy and of Neurology and Neurological Sciences, effective 9/1/2004.
- **David Katzenstein** has been promoted to Professor (Research) of Medicine effective 9/1/2004.
- **Steven Leibel** has been appointed as Professor of Radiation Oncology at Stanford University School of Medicine, effective 8/1/2004.
- **David Miklos** has been appointed as Assistant Professor of Medicine (Bone Marrow Transplantation), effective 9/1/2004.

Dean's Newsletter September 20, 2004

The Science, Ethics and Politics of Stem Cell Research

A special issue of *Stanford Medicine*, now available in print as well as on-line through our Website (<http://med.stanford.edu>), is devoted virtually entirely to “The Science, Ethics and Politics of Stem Cell Research.” This includes balanced and thorough coverage of this most important topic, which, in part due to the work of Stanford faculty and leaders, has become a centerpiece of a national debate. I would strongly encourage you to read the articles and commentaries in this issue – they will inform and equip you with the information you need to better understand the issues and reach thoughtful conclusions. However, I hasten to add that overall the authors and commentators, including me, do have a strong view that stem cell research should proceed – but with the highest ethical standards and appropriate guidelines. The bottom line is that the benefits from this evolving science can help provide keys to better understanding developmental biology and in time will almost surely result in new approaches to the diagnosis, treatment and prevention of a number of human diseases.

I also want to thank the individuals who have worked hard to make this issue of *Stanford Medicine* so relevant and important. Rosanne Spector, editor of *Stanford Medicine*, has worked tirelessly to make this (and previous issues) successful. I also want thank our science writers Michele Brandt and Amy Adams for their contributions and, of course,

Paul Costello, Executive Director of Communications and Public Affairs, for his exceptional leadership and creativity. I also want to thank our School of Medicine authors as well as guest contributors including Michael J. Fox, Ron Reagan, Tom Okama and Bob Kline.

The issues surrounding the science, ethics and politics of stem cell research are both complex and, in some ways, actually quite simple. They are also important to understand and perhaps most importantly, to act on.

Thinking About Translational Medicine

As you know, *Translating Discoveries* is the overarching theme for our School of Medicine Strategic Initiatives (<http://medstrategicplan.stanford.edu/>). To refine our mutual understandings about translational medicine and to develop the action items to develop and enhance their implementation, a series of faculty focus groups sponsored by the Dean's office were held during the past year. Because the focus groups were limited in number, I thought it would be helpful to share some of their ideas with you in the hope that they might generate additional comments. Please send any suggestions or recommendations that you might have to me or others in the Dean's Office (especially Senior Associate Deans John Boothroyd (jboothr@stanford.edu) and Harry Greenberg (hbgreen@stanford.edu)).

The focus groups organized their current thoughts and ideas around a handful of cluster areas that include:

- ***Creating and Sustaining Teams:*** Almost by definition translational research, and especially patient-oriented research, requires the formation of teams. There are a number of ways to structure and support such teams. An important example that I have mentioned in previous Newsletters was the initiative, in 2002, by leaders in the Department of Medicine and Beckman Center to mutually support novel translational research proposals that enjoined basic and clinical scientists. This was an important initiative that has already contributed to some impressive new collaborations. Because this was a pilot project arising from leaders within the School, the issue of its sustainability over time is relevant. Accordingly, Drs. Boothroyd and Greenberg have decided to continue the support for novel research proposals by adding funding from the Dean's office. They are also eager to address ways to direct a portion of this competitive funding to junior faculty and to encourage collaborations between Investigators (aka UTL faculty) with Clinician Scholars/Investigators (aka MCL faculty).
- ***Providing Resources to Support Research:*** Here the focus groups have identified the importance of identifying core facilities and research support services that will overlap among the Stanford Institutes of Medicine and thus require coordination. Based on this, Drs. Boothroyd and Greenberg have begun identifying perceived needs for core facilities. With Dr. Steve Alexander and others we are also exploring ways to better support the translational/patient-oriented research infrastructure (e.g., biostatistics, data management, information technology, etc).

- **Research Program Alignments:** The focus groups recognized the importance of sustaining and enhancing collaborations that permit population based research especially in conjunction with other institutions, such as Kaiser. Additional alignments are also being explored.
- **Overcoming Internal Obstacles:** The focus groups noted that there is a concern among junior faculty that participation in translational and/or patient-oriented research has the potential to have a negative impact on promotion. Since our traditional academic promotion process has focused on the role of faculty as independent investigators, team-based research may be viewed as a less important means to promotion. Dr. David Stevenson has been reviewing ways of embracing team research into the appointments and promotions process for the Investigator Track as has been done, for example, for the Clinician Scholar/Investigator Track.
- **Fostering Applications for Team Based Research:** Traditionally, Stanford has been known as an institution that focuses on R-01 funding applications and less so on “Program Project Grants.” While recognizing the importance of continuing our great strength in independent investigation (the R-01 model) it is also clear that we need more of a “cultural acceptance” of Program Project Grants, SCOREs, etc. This will require faculty to see the desirability of such research and the need for the School to help support and value its performance. As discussed in previous Newsletters, the movement of the NIH toward these collaborations, evidenced through the NIH Roadmap, shows the need to pay attention to interdisciplinary and team based research efforts. We have made some strides in communicating new opportunities for this type of research to the Medical School community. In addition, as announced in the April 5th Dean’s Newsletter, (http://deansnewsletter.stanford.edu/archive/04_05_04.html#7) we have appointed Mr. Chris Webb as the School’s Interdisciplinary Grants Development Manager. In that capacity, Chris is available to help faculty organize and assemble large multi-faculty, multi-departmental grant applications. He is also available to assist on grant applications involving collaborations between SOM faculty and faculty in other schools. Chris can be reached at 736-2968, or at cdwebb@stanford.edu.
- **Education and Training:** Interest has been raised in creating educational opportunities for medical students and for graduate students in translational and patient oriented research. A new Scholarly Concentration is being added to the Stanford Medical School Curriculum on Clinical Research under the leadership of Dr. Charles Prober, Professor of Pediatrics (see July 26th issue of the Dean’s Newsletter: http://deansnewsletter.stanford.edu/archive/07_26_04.html). Discussions are also being initiated with Stanford Institute of Medicine Directors to incorporate education regarding translational medicine into the agenda for each of our four Institutes. In addition, Dr. Ben Barres, Professor of Neurobiology, has proposed the development of a Masters in Medicine Program for PhD students to provide specific training in “translational medicine.” Further discussions are being initiated to explore the establishment of a PhD program for residents or

fellows who have decided to pursue a career in research, modeled after the STAR program currently in place at UCLA.

- ***Organization and Finance:*** We are currently exploring ways to establish a Center for Translational Medicine and Patient-Oriented Research that would offer the key services necessary to successfully conduct clinical research, including the essential infrastructure (e.g., protocol design, biostatistics, data management, tissue banking, etc), and to link these services to those within departments.

There are numerous other components that are essential to enhancing our mission in translational research that are not covered in this brief listing. As noted above we would welcome your comments and additional suggestions and recommendations.

The Road to the LCME Review

At the September 17th Executive Committee meeting, Dr. Oscar Salvatierra, Professor of Surgery and of Pediatrics, and Rebecca Trumbull, Strategic Planner in the Office of Institutional Research, gave an orientation to the LCME accreditation process. We will be engaged in this process during this academic year. Dr. Salvatierra is serving as the Faculty Leader and Ms. Trumbull is the Project Manager.

For those who may be unfamiliar with the term “LCME”, it stands for Liaison Committee on Medical Education. This is the body that accredits all United States and Canadian medical schools. The Association of American Medical Colleges (AAMC) and the American Medical Association (AMA) jointly sponsor it. The standard accreditation process occurs every eight years and consists of an extensive self -study report submitted to the LCME followed by a site visit by LCME to the institution.

The obvious reason to participate in this process is that we must be an accredited medical school. Less obviously is that it provides an opportunity to focus on medical education using the accreditation standards as benchmarks, to identify institutional strengths and areas where remediation is needed, and to develop strategies to ensure that strengths are maintained and problems are addressed on an on-going basis.

Stanford’s last LCME site visit was in 1997. At that time a number of areas of strength were identified, including a strong university academic environment, an outstanding faculty, a strong, diverse, and supportive student body, and pre-eminence in biomedical research. However, a number of areas of concern were also identified, including inadequate facilities (also cited in the 1983 and 1991 reports), ambiguity in the Medical Center Line, insufficient faculty development, insufficient student performance assessment, and an incoherent medical school curriculum.

Since that time, extensive efforts to correct these concerns have been underway. For instance, we have renovated a number of the teaching facilities and begun the design of a new education facility, clarified faculty roles, including the Medical Center Line, and completely redesigned the undergraduate medical curriculum. In December 2003, LCME

staff made an interim visit to campus and reviewed with others and me our facilities improvements, the plans for the new education facility, and the launch of our new curriculum. The feedback we received at that time was positive.

The self-study process is extensive, labor-intensive, and requires the participation of many members of the School of Medicine community. An LCME Task Force has been established to oversee and review the process. In addition, thirteen subcommittees of faculty, staff, and students have been organized, each corresponding to a section of the LCME requirements. The result of this process will be a major report submitted to LCME in August 2005. In addition, students will undertake an independent process that provides an avenue for them to assess their educational experience. Their report will be submitted to the LCME at the same time as the larger school report. The site visit will occur in October 2005.

The LCME accreditation process is critically important for the School of Medicine. If you are asked to provide data, I hope you will respond in a timely manner. If you have been asked to serve on a subcommittee, I hope you will participate fully. Each contribution matters and will add to the success of this effort.

If you have questions about this process, please direct them to Rebecca Trumbull at trumbull@stanford.edu.

Stanford Medical Curriculum Continues to Evolve

Last fall the School introduced the New Stanford Curriculum that was the result of a nearly two-year planning process led by Dr. Julie Parsonnet, Senior Associate Dean for Medical Education. Also key to this endeavor were the efforts of Dr. Neil Gesundheit, Associate Dean for Medical Education; Dr. Ted Sectish, Chair of the Committee on Courses/Curriculum (CCC); and Dr. Oscar Salvatierra in his role as Chair of the School of Medicine Faculty Senate. I should hasten to add that many dozens of other faculty, staff and students played critical roles in bringing the New Stanford Curriculum to life and, during the past year, to continue to nurture and further develop and refine it. I wish I could thank everyone by name – but I surely want to thank each individual for making the New Stanford Curriculum a high priority and an opportunity for our students and our School.

I have presented numerous updates on the New Stanford Curriculum in prior Newsletters and the details are well delineated on the School's Education Website (<http://med.stanford.edu/md/>). Because September 15th was the first meeting of the new academic year for the Faculty Senate, an update on the Stanford Curriculum and some of the new and future projects related to the curriculum were presented.

To remind you, the New Stanford Curriculum intersects education in basic and clinical science with the practice of medicine and individual scholarship. Five major themes define the New Stanford Curriculum and include:

1. **Integration** – includes a dramatically more streamlined content and optimized course sequence than was present before the fall of 2003. A major overarching goal is to meld and integrate basic science and clinical medicine through all years of medical education (and indeed, to serve as a training platform for life-long learning).
2. **Flexibility** – builds on Stanford’s past education programs and now provides blocks of unscheduled time (during the first two years) for individual or group study, elective course work, Scholarly Concentrations, and research. The program is also flexible enough to permit students to choose a fifth or sixth year of education and to pursue joint degrees.
3. **Early Instruction in Clinical Practice** – now includes a broad education in clinical science that begins with the first year and nearly immediately includes exposure to patients and the practice of medicine.
4. **Scholarly Concentrations** - provides opportunities for longitudinal in-depth learning, scholarship, and research and which, in many ways, serves as the centerpiece of the New Stanford Curriculum. Each student who enrolled beginning August 2003 is required to choose a Scholarly Concentration that can be tailored to either the Scholars Track or the Original Research Track. It is our hope that nearly all students will choose the Original Research Track. Currently there are ten Scholarly Concentrations to choose from including Bioengineering, Biomedical Ethics and Medical Humanities, Biomedical Informatics, Clinical Research, Community Health and Public Service, Health Services and Policy Research, Immunology, Molecular Basis of Medicine, Women’s Health, and Independent Design. Each offers an opportunity for students to develop deeper knowledge and expertise and serves as a template for increasing analytical thinking, research experience and, importantly, an increased passion for medicine, scholarship and inquiry. The Scholarly Concentrations also provide an opportunity to pursue joint degrees within the School of Medicine or with other Schools at Stanford (e.g., Law, Business, Humanities and Sciences or with the UC-Berkeley School of Public Health). Dr. Pat Cross has played a critical role in overseeing the Scholarly Concentrations and is a resource to our students about this exciting aspect of the New Stanford Curriculum.
5. **Mentoring** - is essential to the success of each student, and a revitalized Advising Program has been established to help each student achieve her or his professional and personal goals.

Building on these initiatives, Dr. Parsonnet discussed the next major phase of curriculum reform, the clinical rotations. This will include a critical review of the current clinical teaching programs, an expectation that each department will develop an education committee if not already in place, and that a more robust evaluation program will be put in place. In that regard, Drs. Elizabeth Stewart, Professor of Pediatrics, and Miriam Curet, Assistant Professor Surgery, described the very significant progress they are making in significantly improving the evaluation system. One important effort underway is to provide a tutorial for faculty evaluators, students and clerkship directors on clerkship evaluations in order to help guide each group about expectations, components of the evaluation process and the appropriate way to complete the evaluation. These can be

viewed at http://med.stanford.edu/clerkship_eval/. The overarching goal is to assure that we develop a system of evaluation that is fair, accurate, complete and fully reflective of our student's performance. Further updates regarding these efforts will be discussed in future Dean's Newsletters.

An additional exciting facet of the review of clinical clerkships will be the program in Applied Basic Sciences. As discussed by Dr. Parsonnet, this will involve venues for including basic science topics into the clinical rotation curriculum as a means of better integrating science and clinical medicine. These will include rotation specific study topics, a focus on translational medicine, and case-based discussions with basic and clinical science faculty as well as intercessions that may be class-wide as compared to rotation specific.

Curriculum reform is a constant work in progress and must, if it is to be viable, continue to evolve and improve. There is little doubt that the past year has witnessed considerable change and that the years ahead will continue to reflect further refinements, new additions, and hopefully some deletions as well. But to be effective and optimal for future generations of students the New Stanford Curriculum will continue to develop so that it is truly always new and exciting and prepares our students to be outstanding physicians, scientists and leaders.

Executive Committee Discusses Medical Student Admissions

Over the past year, the Executive Committee has had a number of discussions about medical student admissions. While everyone acknowledges that we are most fortunate to have had outstanding students enter our medical student classes, we have also recognized the importance of aligning the interests and aspirations of prospective students to the directions, goals and missions of the School of Medicine. With the New Stanford Curriculum and its enhanced focus on scholarship and Scholarly Concentrations, it is increasingly important to assure that applicants are aware of the School's chosen emphasis and that the faculty and students are as optimally matched as possible.

Earlier this year I appointed a Subcommittee of the Executive Committee to work with Dr. Gabe Garcia, Director of Admissions, to review and address ways of further optimizing the admissions process. The Subcommittee was chaired by Dr. Bill Mobley (Neurology and Neurological Sciences) and included Drs. Ron Pearl (Anesthesia), Suzanne Pfeffer (Biochemistry), Mary Lake Polan (Obstetrics/Gynecology), Judy Swain (Medicine), Irv Weissman (Pathology, Developmental Biology), Kathy Gillam (Special Assistant to the Dean), and Gabe Garcia. Among the recommendations of this Subcommittee, which will go into effect immediately, is a request that applicants familiarize themselves with the New Stanford Curriculum and write an essay about how the Scholarly Concentrations help them to achieve their goals. Students who are offered interviews (clearly a small fraction of the overall pool of applicants), will meet with a faculty member who matches their area of scholarly concentration interest as well another faculty member and student. Importantly, the number of senior faculty members engaged in the interview process will be expanded (with the support of the Executive Committee)

and the rolling admission process, used in the past, will be abandoned in favor of a more consolidated interview and admission season extending from December through February.

The Executive Committee acknowledged the importance of working with the Committee of Five and Faculty Senate and also recognized the excellent job that Dr. Garcia has done as Director of Admissions. It is our shared goal to make the admissions process more meaningful for applicants and as optimized as possible in selecting students who are most likely to benefit from the New Stanford Curriculum and equally become leaders in the future of medicine and the biosciences.

Government Affairs Update

On September 15th, the Senate Appropriations Committee approved the fiscal year 2005 Labor, Health and Human Services, Education and Related Agencies Appropriations bill. Within this, the portion of the appropriations bill related to HHS totaled \$142,317 billion. Some of the programs of specific relevance to academic medical centers include:

National Institutes of Health -- The bill includes \$28.9 billion, an increase of \$1.1 billion over the FY'04 appropriation and \$380 million over the President's budget request.

Centers for Disease Control & Prevention -- The bill includes an increase of \$345 million over the budget request, for a total of \$4.8 billion.

Global AIDS -- The bill includes \$660 million for global HIV/AIDS activities. Within this total, \$149 million is included for the Global Fund for HIV/AIDS/TB, which is \$50 million over the budget request and the same as last year. In addition, \$118.8 million is included in the CDC budget for global HIV/AIDS/TB activities.

Pediatric Graduate Medical Education -- The bill includes \$303 million, the same as the President's request.

Pandemic Flu -- The bill includes \$75 million in new funding to ensure that an adequate supply of vaccine would be available in the event of a severe flu outbreak.

Substance Abuse & Mental Health Services -- The bill provides \$3.5 billion, an increase of \$133.8 million over last year. SAMHSA is responsible for supporting mental health programs and alcohol and other drug abuse prevention and treatment services throughout the country.

The complete listing is available at
<http://appropriations.senate.gov/releases/record.cfm?id=226159>

Community Lecture Series Begins for 2004-2005 Season

Under the leadership of Senior Associate Deans John Boothroyd and Harry Greenberg, the Community Faculty Lecture Series began its second season on Tuesday, September 7th. Dr. Rick Myers, Stanford W. Ascherman, M.D., F.A.C.S. Professor and Chair of the Department of Genetics, gave a wonderful overview of the human genome project and its relevance to understanding genetic differences among species and, ultimately, how the knowledge created will result in new approaches to the diagnosis, treatment and prevention of disease. Dr. Myers spoke to a capacity audience in the Clark Center Auditorium and engendered considerable discussion about human genetics as well as the exciting research that is occurring in this field, much stimulated by investigators at Stanford.

The Community Faculty Lecture Series is designed to bring cutting-edge innovation and discovery to members of our local community. The purpose of these monthly events is to engage our community in the work being done by Stanford scientists and physicians and, as a result, makes them more appreciative of the critical role that the Medical Center plays in our local and global communities.

Lectures have been scheduled for the first Wednesday evening of each month (except December and January) through June 2005. A wide diversity of topics will be presented including “Creativity, Mood, and Temperament” and “New Treatments for Mood Disorders” on October 6th, “Regenerative Medicine: A Hope for the Future on November 3rd, “Skin Cancer” on February 2nd among others.

Awards and Honors

Sam Gambir will receive the Gold Medical from the Society of Molecular Imaging. This Achievement Award is “given to an individual who has made a fundamental discovery in the field of Molecular Imaging that has changed the direction of the field, or enabled new in vivo investigations that were not possible prior to their contribution”.

Dr. Fernando Mendoza, Professor of Pediatrics at the Lucile Salter Packard Children's Hospital, was selected by the California Latino Medical Association (CaLMA) to receive their highest award bestowed on Latino healthcare leadership, the Juan Villagomez, M.D. Humanitarian Award. The recipient of this award embodies the commitment that is necessary to create change and possesses a vision by which he works towards the betterment of Latino healthcare. Dr. Mendoza was honored with this award on Saturday, September 18, 2004 at the Dorothy Chandler Pavilion in Los Angeles, California.

Congratulations to Dr. Gambir and Dr. Mendoza.

Announcements

The Ninth Biennial National Symposium on Hematopoietic Cell Transplantation will be held in the Fairchild Auditorium from September 30-October 2. You can find the registration form on <http://bmt.stanford.edu/symposium/>, which can then be faxed, to Sonni Doran at 725-8950.

A CME Event sponsored by the Center for Clinical Immunology at Stanford entitled “Clinical Immunology: An Interdisciplinary Medical Science” will be held on Saturday October 23rd from 7:45 am – 1:00 pm in the Clark Center. Registration forms can be found at <http://ccis.stanford.edu>

Community Lecture Series: As noted above, in our continuing lecture series to educate the community about important research findings or issues impacting patient care, Dr. Terence Ketter, Associate Professor of Psychiatry and Behavioral Sciences, will lecture on *Creativity, Mood, and Temperament* and Dr. Alan Schatzberg, Kenneth T. Norris, Jr. Professor of Psychiatry and Behavioral Sciences, will lecture on *New Treatments for Mood Disorders* on Wednesday, October 6th at 7:00 p.m. in the Clark Center Auditorium.

The Center for Clinical Immunology at Stanford (CCIS) announces their second Continuing Medical Education (CME) event to be held at the Clark Center Auditorium on Saturday, October 23rd from 7:45 am to 1:00 pm. The event is entitled: *Clinical Immunology: An Interdisciplinary Medical Science* and will include a discussion of New therapies to treat immune-based diseases in rheumatology, IBD, and dermatology. Speakers include Drs. Chakravarty, Fiorentino, Genovese, Shizuru and Strober from Stanford, Dr. Abbas from UCSF and Dr. Papadakis from UCLA.

The mission of the CCIS is to educate physicians, trainees, and the public in order to bring discoveries in basic science to bear on immune-mediated inflammatory diseases, ranging from cancer to diabetes and from arthritis to infectious disease, bridging the spectrum of research from the genetic and molecular level to clinical trials, and sharing information and resources in order to speed the translation of new therapies from the laboratory bench to the patient's bedside. The program and registration forms can be found on the CCIS web site at: <http://ccis.stanford.edu>. Breakfast and a lunch will be provided for all registered attendees.

Appointments and Promotions

- **Manuel Amieva** has been appointed Assistant Professor of Pediatrics (Infectious Diseases) and of Microbiology and Immunology, effective 9/1/2004 to 8/31/2007.
- **William Maloney** has been appointed Professor of Orthopedic Surgery, effective 9/1/2004.

Dean's Newsletter

October 4, 2004

Official Launch of the Stanford Institute of Immunity, Transplantation, Infection and More

I am very pleased to announce the appointment of Dr. Mark Davis as Director and Dr. Carlos Esquivel as Associate Director of the Stanford Institute of Immunity, Transplantation and Infection. With this announcement we are officially launching our fourth Institute. The Stanford Institute of Immunity, Transplantation, and Infection joins the three other institutions previously established that are now helping to shape the future of the School of Medicine and the Medical Center. Over the past 20 months we have established the Stanford Institute on Cancer/Stem Cell Biology and Medicine directed by Dr. Irv Weissman, the Stanford Neuroscience Institute directed by Dr. Bill Mobley, and the Stanford Cardiovascular Institute directed by Dr. Bobby Robbins. Each is following a different trajectory and path but all are aligning basic and clinical faculty and striving to enhance our overarching mission of *Translating Discoveries* (<http://medstrategicplan.stanford.edu/>).

The Stanford Institute on Immunity, Transplantation and Infection will bring together faculty who are engaged in basic research in immunology, host-parasite interactions and pathogenesis, transplantation and regenerative medicine and their touch-points to clinical immunology (including many chronic diseases), organ transplantation, clinical infectious diseases and emerging global infections

Dr. Mark Davis, Professor and Chair of the Department of Microbiology and Immunology, assumed his new role on October 1st. Dr. Davis is an internationally renowned immunologist who has made seminal discoveries in molecular and cellular immunology and who is interested in and committed to enhancing connections of basic science discovery with clinical medicine. The appointment of Dr. Carlos Esquivel as Associate director was also effective October 1st. Dr. Esquivel, Professor of Surgery and internationally recognized pioneer in organ transplantation, especially liver transplantation and more recently intestinal and pancreatic transplantation. Together they bring an enormous wealth and depth of knowledge and skill that spans the spectrum between basic discovery and clinical application.

With the initiation of the Stanford Institute on Immunity, Transplantation and Infection we have laid down four pillars that help align our Medical Center community. Importantly, in the faculty alignment survey we conducted at the end of 2003, over 85% of our School of Medicine faculty; both basic science and clinical, reported an alignment with one or more of these four Stanford Institutes of Medicine. Faculty from other schools within the University are also engaged in the institutes and will enable us to further foster interdisciplinary research and education. The linkage of the Stanford Institutes of Medicine with the Clinical Centers of Excellence at the Stanford Hospital and Clinics and the Lucile Packard Children's Hospital is delineated in the following graphic:

STANFORD
SCHOOL OF MEDICINE

Stanford University Medical Center

Developing Aligned Partnerships

Stanford University School of Medicine	Stanford Hospital & Clinics	Lucile Packard Children's Hospital
Cancer/Stem Cell Biology and Medicine Institute	Clinical Cancer Center	Cancer Center
Neurosciences Institute	Center for Neurosciences	Center for Brain and Behavior
Cardiovascular Medicine Institute	Cardiac Center	Heart Center
Institute for Immunity, Transplantation, Infection	Transplant Center	Transplant Center

In addition to establishing the Stanford Institutes of Medicine, which focus on disease or discipline areas, over the next several months we will also be forming three enabling centers that will cross the boundaries of each Institute (and indeed faculty within Institutes will also surely collaborate across Institutes as well). The three enabling centers will be the Center for Genetics and Genomics, the Center for Informatics/Bioinformatics and the Center for Imaging (especially molecular imaging). These too can be illustrated as follows:

The Stanford Institutes of Medicine

Indeed, when these three Enabling Centers are fully engaged our alignment data indicate that more than 95% of our faculty will be connected to one or more of the Institutes or Enabling Centers. Of course it is important to underscore that this organizational schema is largely virtual and is designed to complement and support the traditional and fundamental departmental structure that anchors the school and faculty. Also importantly, the model should not be viewed as in any way muting the essential foundational role of basic research in the school. Indeed, fostering and enhancing basic research are essential not only to generating new knowledge and innovation but also to assure that the pipeline for future translational medicine is robust and outstanding.

Stanford Cardiovascular Institute: Promise and Progress

On Tuesday, September 21st, the Stanford Cardiovascular Institute hosted a wonderful educational program for the community that highlighted advances in cardiovascular research and patient care – and the remarkable role that Stanford Medical Center has played in this important arena. Over 200 guests gathered at the Arrillaga Alumni Center for wonderful evening program. The stage was set by remarks from Dr. Norman Shumway, Frances and Charles Field Professor of Cardiovascular Surgery, Emeritus. Dr. Shumway's whose career has become a legend of surgical innovation, especially in heart transplantation, but also in training and developing a generation of cardiovascular surgeons who are leading programs of excellence throughout the world and of course at Stanford.

Dr. Bobby Robbins, the Director of the Stanford Cardiovascular Institute, and his colleagues put together the outstanding evening program. Dr. Paul Yock, Martha Meier Weiland Professor and Co-Chair of the newly formed department of Bioengineering, gave the keynote address and helped set the stage for the program as well as for the

importance and opportunities for the Cardiovascular Institute. He noted that the convergence of a number of factors at Stanford along with the strong and exciting connections of Stanford with the Bay Area biotechnology community would all come to life in the Stanford Cardiovascular Institute and offer a future of promise and progress. Among the Stanford factors he identified were our long history of innovation in vascular devices and surgical techniques basic research, the broad based program linking the life sciences and physical sciences, the new department of Bioengineering, the commitment of both Stanford Hospital & Clinics and the Lucile Packard Children's Hospital to fostering and supporting outstanding clinical heart centers.

The program offered an array of stimulating topics for the public including:

- ***Preventing Heart Disease: What's New*** – led by Dr. Steve Fortmann, Director of the Stanford Prevention Research Center.
- ***Congestive Heart Failure*** - led by Dr. Michael Fowler, Medical Director, Stanford Cardiomyopathy Center.
- ***Do We Need Bypass Surgery in the Era of Medicated Stents*** - led by Dr. Alan Yeung, Chief of Cardiovascular Medicine (Clinical) and Director of the Cardiovascular and Interventional Laboratories.
- ***Menopausal Hormones and Women's Cardiovascular Health*** - led by Dr. Marcia Stefanick, Professor of Medicine.
- ***New Paradigms in Cardiac Care for Children*** - led by Dr. Dan Bernstein, Chief of the Division of Pediatric Cardiology, and Dr. Dan Murphy, Director of the Adult Congenital Heart Center.
- ***Advances in the Evaluation and Management of Arrhythmias*** - led by Dr. Paul Wang, Director of the Cardiac Arrhythmia Service and Electrophysiology Laboratory.

I want to thank Dr. Robbins and the faculty noted above for their outstanding participation in making the program so successful. During the last year we have been featuring comprehensive “mini-medical school”-like programs for the community under the banner of our Stanford Institutes of Medicine. These are excellent opportunities to reach out to our broad community and engage them about the exciting work taking place at Stanford Medical Center. I certainly hope that these and related events will also encourage the community to become better advocates and supporters for Stanford and help us achieve our goals of transforming medicine and translating discoveries.

Dr. Julie Theriot Joins the Lofty Ranks of MacArthur Fellows

On Tuesday September 28th, the wonderful news was announced in the national media and Stanford Report (add URL) that Dr. Julie Theriot, Assistant Professor of Biochemistry, was named one of the 23 recipients of the prestigious MacArthur Fellowship. I want to add my congratulations to Dr. Theriot as well as to Stanford Associate Professor of Computer Science, Dr. Daphne Koller, who also received

MacArthur Fellowship. Their accomplishments are remarkable and their future promise for future contributions is exciting.

As you likely know, the MacArthur Fellow Award is often also known as the “genius award”. Some weeks ago at an Executive Committee meeting the chair of our departments referred to a faculty member being considered for promotion as a genius. That sparked an interesting exchange among our chairs about the various geniuses in their respective departments and throughout the school. I have no doubt that we do indeed have many geniuses at Stanford – it is a very special place. But at least today, one of our faculty has a visible credential that makes her a bone fide “genius” in the eyes of the world! Congratulations to Dr. Theriot.

Commission on Graduate Education is Appointed by President Hennessy

One of the truly exciting and potentially transforming initiatives now being started at Stanford is the appointment of the Commission on Graduate Education by President Hennessy. Its overarching goal, emanating from discussions at the Executive Cabinet (comprised of the Deans, President and Provost) is to develop a plan to foster novel interdisciplinary and interschool programs for graduate and professional students. It seems clear that the skills needed to transform society will often require knowledge outside of the traditional boundaries of a given discipline. For example, the opportunity for graduate students in the biosciences or medical students to receive education (and even a joint degree) in business or for law students to become knowledgeable in the biosciences or business illustrate opportunities to educate and train a new generation of scholars and leaders. The Commission, which includes representation by school and is chaired by Dr. Mark Horowitz, the Yahoo! Founders Professor in the School of Engineering, and Dr. Chuck Holloway, the Kleiner, Perkins, Caulfield and Byers Professor in Management. Dr. Julie Parsonnet, Senior Associate Dean for Medical Education and Dr. John Boothroyd, Senior Associate for Graduate Education and Postdoctoral Affairs are the School of Medicine representatives. The Commission is being charged to complete its analysis by spring of 2005. If successful, this Commission will have a extraordinary impact on the way graduate and professional education is carried out at Stanford and has the potential to truly transform the future of the University.

The Commission on Graduate Education comes at an exciting time for the Medical School. During the past three years we have been revising the medical student curriculum to train physicians who are outstanding clinicians and who are, equally importantly, scholars and leaders. Our New Stanford Curriculum encourages the opportunity for joint degree programs and fosters connections to interdisciplinary programs. Our evolving efforts for graduate education and those that we will be commencing for postdoctoral training will also seek to foster interdisciplinary training pathways. Accordingly, I am particularly excited by the new Commission on Graduate Education and look forward to working with all of our university colleagues to develop an innovative plan for the future of graduate education at Stanford.

New Leadership in the Office of Postdoctoral Affairs and New Career Center

At the October 1st Executive Committee meeting, Dr. John Boothroyd, Senior Associate Dean for Research, Graduate Education, and Postdoctoral Affairs, introduced two new members of his group, Chequeta Allen, Assistant Dean of Postdoctoral Affairs, and Michael Alvarez, Director of the Career Center. Both are new to Stanford, and both provided the Executive Committee with an overview of their respective offices.

Ms. Allen reviewed the core services of the Office of Postdoctoral Affairs (OPA), as well as their educational programs. These include collaborations with Lane Library to provide seminars on preparing for scientific poster sessions and writing grants, an instructional techniques seminar, and a lab establishment course. Her office is also working on the development of mentor/protégée models and requirements. Ms Allen is particularly interested in providing a useful orientation for postdocs, making it easy to them to get the information they need about the various and scattered resources on campus, and encouraging them to develop good relationships with their faculty PI's. Her office is also involved in benefits issues for postdocs as well as the many issues arising for international postdocs.

Mr. Alvarez is the first Director of the School's new Career Center. The Center is dedicated to assisting graduate students and post-doctoral fellows in identifying the career path that best meets their individual interests, and then landing the best position possible. The services provided by the center encompass confidential counseling/advising, individualized career development planning and support, job search strategies, as well as career workshops. A full range of programs will be offered, including information sessions and industry-specific career fairs and alumni panel discussions. The partnerships established by the Center will critical to the success of the program, and Mr. Alvarez is working to establish external partnerships with a wide range of professional associations, including those in academe, industry, government and the media.

I encourage all graduate students and post-doctoral fellows to take full advantage of the valuable resources offered by their offices. The Office of Postdoctoral Affairs and the Career Center are located in CCSR, Room 4235.

Venture into the Future: Trends, Research and Innovation in Medicine

I want to thank Paul Costello, Executive Director, and the staff of Communications and Public Affairs, for planning and conducting a wonderful first Science Writers Symposium entitled "Venture into the Future: Trends, Research and Innovation in Medicine".

Reaching out to colleagues in the media and educating them about the exciting events unfolding at Stanford are important ways to inform the lay public and to re-engage the public trust in medicine and science. At a time when many of our nation's citizens are disenchanted with health care, particularly its increasing costs and concerns about access, quality and medical errors, we have the obligation to provide as much hope and guidance as we can. Events such as our Community Lecture Series, Mini-Medical School events (see above) and related activities complement our efforts to serve the community by providing the most advanced and highest quality clinical care that we can. Engaging the

science and medical writers who report the news is another important way to accomplish our communication goals and strategies.

The Science Writers Symposium attracted journalists from all over California, and they were treated to very special presentations. They learned about our exciting initiatives in medical education and the opportunities unfolding through our Stanford Institutes of Medicine. They heard how integrative healing can complement the powers of all allopathic medicine. And they learned about important challenges such as childhood obesity, stress and health, women's health and the politics of health care as well as some of our broader initiatives, including BioX, bioengineering and bioethics.

In addition, the dinner speaker was Mr. Bob Klein, who has been the force behind Proposition 71. This proposition would create funding for stem cell research in California. Mr. Klein gave a stimulating presentation on the current and future role of stem cell research and how, in his opinion, Prop 71 can help make California the nation's leader in this important area of research.

As you likely know by now, Prop 71 is attracting enormous attention, both in California and across the nation. It represents a truly watershed moment. While the University does not take a stand on such matters, it does have a viewpoint that is expressed as follows:

“The California Stem Cell Research and Cures Initiative (Proposition 71), a proposal to provide public funding for stem cell research in California, has qualified for the November ballot. While stem cell research is in its infancy, scientists generally agree that this field of research has shown the potential to change the way we come to understand and to treat disease. There is hope that therapies developed over time could treat diabetes, Parkinson's disease, Alzheimer's disease, multiple sclerosis and other diseases that afflict so many American Families.

At Stanford, scientist are particularly interested in three major areas of stem cell research: 1) Discovery of the several types of adult tissue stem cells and using such cells to combat autoimmune tissue destruction and regeneration of destroyed tissues; 2) Discovery of the stem cells in cancers that divide indefinitely, with the promise that stem cell research can bring to the development of cancer treatments; and 3) Development of pluripotent stem cell lines from patients with common and rare genetic disorders. To further these studies, Stanford University has established the Institute for Cancer/Stem Cell Biology and Medicine. Although Stanford is seeking private sources of funding to support this critical research, this private philanthropy is not sufficient to advance this important area of research quickly enough. Current federal policy has significantly limited the availability of funding to enable this research to reach its full potential. Stanford

University strongly supports stem cell research and believes that it merits public funding.

Stanford University does not normally take a position on ballot measures before the electorate, and it takes no institutional position on Proposition 71. Of course, individual members of the Stanford community, some of whom are experts in stem cell research and economics, will express their views as citizens. If Proposition 71 becomes law, Stanford will enter into competition for appropriate support of research and research facilities related to stem cell research at the University.”

I encourage you to learn more about Prop 71 and to consider it carefully when you vote in November. While my position on Prop 71 should not be construed as anything more than personal and that of a private citizen, I do plan to vote in favor of this initiative.

Continued Concerns About the Anti-Science Position in Washington

Others and I have expressed concerns about the seemingly anti-science perspective emanating from Washington during the past three years. Recent position statements in leading journals have raised concerns but the process for scrutiny by both the legislative and executive branch of the federal government casts a very worrisome trend. Whether the Twomey amendment or the Neugebauer amendment, the public discrediting of NIH peer reviewed grants that deal with sensitive topics, especially sexual behavior, represents a very disturbing trend. We have experienced a similar trend with regard to stem cell research where the Weldon Bill (which passed the House of Representatives) or the Brownback Bill (which has so far failed to pass in the Senate) actually seeks to criminalize research using embryonic stem cells.

I attended the annual meeting of the Infectious Disease Society of America over this past weekend where Dr. King Holmes, a distinguished professor of medicine (infectious diseases) gave the distinguished Maxwell Finland Lecture on “Sexually Transmitted Diseases”. In his erudite and scholarly presentation, Dr. Holmes reviewed the data on condom use and prevention of infectious disease – a topic of enormous importance to AIDS and many other sexually transmitted infections. The data was compelling but overshadowed by his review of the current administration’s efforts to publicly discount or dismiss the value of condoms while promoting abstinence. These should not be viewed as mutually incompatible. Yet the refusal to accept the value of condoms could cost many lives, especially on an international basis where HIV infection has become so explosive. Such strong ideological stands, which have become all too familiar in recent years, are most disturbing and will have a negative impact on public health if they go unchallenged.

LCME Review Update

During the past several weeks a number of presentations regarding the planning efforts for the LCME review that will occur in October 2005 have taken place, thanks to the

efforts of Dr. Oscar Salvatierra, Professor of Surgery (Transplantation) and of Pediatrics (Nephrology) and Faculty Lead and Rebecca Trumbell, Project Manager. One of the most important was with a group of about 50 medical students who had the opportunity to learn more about the LCME review and preparation process and, most importantly, to begin their own student-led self-study and evaluation process. The role of the students in the LCME review is extremely important. Students will be assigned to the various committees as part of the overall LCME School-wide self study process but will also function independently. At our meeting we presented to our student leaders and colleagues the background of the LCME process and the various things the School has done to address the upcoming review since the last formal site visit by the LCME in 1997. The goal will be to have as much communication with the broad community about this process as possible so that we can address all the major issues well in advance of the actual visit in October 2005. We also had the opportunity to review these goals and plans with the LCME Steering Committee, which includes representatives from throughout the School as well as the University and the Board of Trustees. It is our mutual goal to have as successful a site visit as possible so that we can assure the continued and important success of Stanford as a premier School of Medicine.

Planning for the Center of Immersive and Simulation-based Learning

With the appointment of Dr. David Gaba as the Associate Dean for Immersive and Simulation Learning, strategic planning has begun for the Center for Immersive and Simulation-based Learning (CISL pronounced sizzle!). CISL will be a consortium of simulation activities and facilities affiliated with the School of Medicine. Integrating the efforts of these facilities will expand opportunities for immersive and simulation-based learning for the School of Medicine, Stanford Hospital and Clinics; the Lucille Packard Children's Hospital and the VA Palo Alto Health Care System. *(Simulation is a technique not a technology to replace or amplify real experiences with guided experiences that evoke or replicate substantial aspects of the real world in a fully interactive fashion. An immersive experience engages participants in a task or setting as if it were the real world. An ideal, though fictional, example of full immersion is the Star Trek holodeck. While such seamless immersion is not currently achievable, experience shows that participants in today's immersive simulations easily suspend disbelief, speaking and acting much as they do in their real jobs)*

Dr. Gaba is conducting an initial round of introductory meetings within the hospitals, SoM Departments and across the University to identify interest and opportunities for application of ISL. He has uncovered a wide range of potential applications and surprising pockets of interest in early adoption.

The growing recognition of the applicability of simulation techniques to health care owes much to the work of innovative Stanford and VA Palo Alto researchers. For nearly 20 years, these researchers have pioneered a variety of immersive and simulation-based activities in medicine, which have laid the groundwork for centers throughout the world. The formation of CISL will coordinate and integrate the simulation efforts of four

existing and nascent core Stanford facilities as well as other groups working toward the same goals. The founding simulation groups include:

The VA Palo Alto Simulation Center

The Center for Advanced Pediatric Education

The Center for Simulation in Medicine

The Stanford University Medical Media and Information Technologies

On November 15, 2004, beginning at 8:30am in the Fairchild Auditorium, the School of Medicine will host presentations by nationally recognized experts on immersive and simulation-based learning, as well by School of Medicine and CISL leaders. A demonstration session will allow multimedia and hands-on experience with simulation techniques. There will be a private two-hour session dedicated to Stanford Medical faculty to discuss and explore immersive and simulation-based applications. Lunch will be provided. Please hold the date and stay tuned for more information about this event.

In addition, CISL is beginning a set of outreach activities for medical faculty to foster interaction and learning about simulation techniques. These include a structured observer program for simulation activities that currently run on a regular basis; an expanded lecture series (Simulation in Medical Education SIM1); and a program to provide subsidies for faculty new to this field to attend one of the major U.S. simulation conferences.

CISL hopes that combining, integrating, and creating new efforts in immersive and simulation-based learning will maintain Stanford as a world leader in this arena as it gains in importance to health care as the 21st century moves forward.

Progress Update on the Children's Health Initiative

On Wednesday September 22nd, the Pediatric Medical Advisory Committee (PMAC) visited Lucile Packard Children's Hospital and the School of Medicine to review progress on the Children's Health Initiative. The PMAC includes several nationally recognized leaders in pediatric research including Dr. Tom Boat, Chair of Pediatrics at Cincinnati Children's Hospital, Dr. Doug Jones, Chair of Pediatrics at Denver Children's Hospital and the University of Colorado, Dr. Ora Pescovitz, President and CEO of Riley Children's Hospital and Dean for Research at Indiana University and Dr. Alan Schwartz, Chair of Pediatrics at Washington University. The PMAC will make its final report to Dr. Ron Rosenfeld and the Lucile Packard Foundation for Child Health (LPFCH).

During their daylong visit, the PMAC heard updates from the Dean and the CEO of LPCH along with detailed reviews of the program from Dr. Alan Krensky, Director of the CHI, and the leaders of Children's Health Initiative. The PMAC received a very comprehensive update of the many exciting advances that have taken place during the past several years, many of which have transformed the LPCH and Stanford Pediatrics. Although the official report is not yet public, I want to thank the many faculty, staff and leadership for making this a very informative and (I believe) most successful visit.

Success with NIH Construction Grant

I am pleased to announce that the School of Medicine has been awarded a \$2.35 million construction grant from the NIH towards the creation of a fish and frog facility. Located on the ground floor of the Boswell building, this renovated facility will provide space for the housing, care, and study of various species of fish and frogs. The facility will be equipped with a centralized water purification system to maintain a healthy environment for the fish. The new center will allow the Veterinary Service Center to gain back valuable housing space in the Research Animal Facility for use by other species more appropriate to this specialized environment. The grant application was a combined effort of the Office of Facilities Planning and Management, SU Department of Project Management, Department of Comparative Medicine, and numerous faculty in the School of Medicine including Linda Cork, Sherril Green, David Kingsley, Emmanuel Mignot and James Chen. Other sources of funding for the project are HHMI and the Dean's Office. The center is projected to open in late 2005. Congratulations to all who worked on this project.

A Success in the New NIH Director's Pioneer Awards

One Wednesday September 28th, the NIH announced the first recipients of the NIH Director's Pioneer Award, "a program designed to support individual scientists and thinkers with highly innovative ideas and approaches to contemporary challenges in biomedical research." NIH will provide \$500,000 in direct costs per year for five years to each Pioneer Award recipient, "allowing them the time and resources to test far-ranging ideas with the potential to make extraordinary contributions to medical research." Among the recipients nine inaugural recipients of the NIH Director Pioneer's Award is Dr. Steve Quake who was recently recruited to the new Bioengineering Department at Stanford. According to the NIH, approximately 1000 applications for this new award were submitted to the NIH. That Dr. Quake is one of the first recipients is wonderful news for Steve and for Stanford.

Stanford Also Scores Success in Becoming One of the National Centers for Biomedical Computing

Another great success for Stanford in competing for NIH Roadmap Awards for Stanford was the recent announcement that it would become one of four new National Centers for Biomedical Computing. The centers will create innovative software programs and other tools that enable the biomedical community to integrate, analyze, model, simulate, and share data on human health and disease.

The centers, part of the National Institutes of Health Roadmap for Medical Research, and The National Centers for Biomedical Computing are the key programmatic initiative of the NIH Bioinformatics and Computational Biology Roadmap:
<http://nihroadmap.nih.gov/bioinformatics/index.asp>.

The Stanford Center will be the ***Physics-Based Simulation of Biological Structures Center***, led by Russ Altman, M.D., Ph.D., and Scott Delp, Ph.D., which will develop a simulation toolkit that enables scientists worldwide to model and simulate biological systems from single atoms to entire organisms. More information is available at <http://cbmc-web.stanford.edu/simbios/>

Congratulations to Drs. Altman, Delp and their colleagues.

Senior Faculty Annual Recognition

On Tuesday, September 28th, our Emeritus and Senior faculty gathered for a luncheon and a time for re-acquaintance and interaction. I had the privilege to address the group and shared my reflections on what is currently happening at Stanford across our primary missions of education, research and patient care. I also tried to convey that whatever accomplishments or success we are achieving today is a consequence of the work they did on behalf of Stanford during their own very productive years as faculty leaders. In many ways our current efforts are a reaffirmation of the standards, values and programs they each contributed during their many years of service. We are all appreciative.

Honoring Dr. Richard Kempson

On September 23rd a dinner was held to celebrate a professorship in pathology bearing Dr. Kempson's name. It is an enormous honor for a faculty person to be named to an endowed professorship. But to have a professorship named to honor the a faculty person is a rare and special event indeed. In the case of Dr. Kempson, who has made major contributions to Stanford and the field of surgical pathology, this special honor is well deserved indeed.

In addition to congratulating Dr. Kempson, I also want to thank Dr. Steve Galli, chair of Pathology and the Mary Hewitt Loveless, M.D. Professor, along with the faculty in the department of Pathology for creating the Richard Kempson Professorship.

Congratulations to Dr. Lucy Tompkins and Stanley Falkow

Although their roles and contributions are distinct, Dr. Lucy Tompkins, the Lucy Becker Professor in Medicine and of Microbiology and Immunology and Dr. Stanley Falkow, Robert W. and Vivian K. Cahill Professor in Cancer Research, share much in common – including a marriage. This past weekend they shared separate and distinct honors at the Infectious Disease Society of America meeting in Boston. Lucy was honored by delivering the prestigious Edward H. Kass Lectureship (her presentation was outstanding) and Stan received the Society Citation from IDSA. Congratulations to both Lucy and Stan.

Announcements:

- The **Department of Surgery** is pleased to announce the results of the second annual essay competition for students in the clinical years. Winners will attend the Medical Student Program at the annual meeting of the American College of Surgeons in New Orleans, LA October 10 -13, 2004. This year's competition featured many excellent submissions from clinical students and the following student's essays were chosen by our panel to represent Stanford University at the Program. We look forward to next year's competition and opportunity to continue to showcase surgery to our students, and our students to American surgical leadership.

Congratulations are in order for Anne Zink, Oscar Serrano, and Natalie Kirilcuk who are this year's winners.

- **Fall Forum on Community Health and Public Service** will be held on Monday, October 11, 2004 from 5:00 to 7:30pm in the Frances C. Arrillaga Alumni Center, 326 Galvez Street. Dr. America Bracho, Founder and Executive Director, Latino Health Access (www.latinohhealthaccess.org), will be the Keynote speaker.

The 3rd Annual Fall Forum will feature a wide range of service and partnership research projects undertaken by Stanford students in underserved communities here and around the world. This event is free of charge and open to the public. If you are planning to attend, RSVP to fallforum2004@yahoo.com to assist us in our planning.

Organized by Stanford Medical Students with the support of the School of Medicine's programs in Community Health and Public Service. For more information, see <http://med.stanford.edu/community/>.

Appointments and Promotions

- **Kay W. Chang** has been reappointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 4/1/2004 to 5/31/2008.
- **Susan Frayne** has been appointed to Associate Professor of Medicine at the Stanford University Medical Center, effective 9/1/2004 to 8/31/2009.
- **Karyn A. Goodman** has been appointed to Assistant Professor of Radiation Oncology at the Stanford University Medical Center, 9/1/2004 to 8/31/2007.
- **Rachel Manber**, has been promoted to Associate Professor of Psychiatry and Behavioral Sciences at the Stanford University Medical Center, effective 9/1/2004 to 8/31/2009.
- **Christy I. Sandborg** has been reappointed to Associate Professor of Pediatrics (Rheumatology) at the Lucile Salter Packard Children's Hospital, effective 8/1/2004 to 7/31/2009.
- **Winston Vaughan** has been reappointed to Assistant Professor of Surgery at the Stanford University Medical Center, effective 4/1/2005 to 3/31/2008.

Dean's Newsletter

October 18, 2004

Continued Thoughts About Clinical and Translational Research: *Juxtaposition of Stanford's Annual ACCESS Meeting and a Meeting with the NIH Director on a Vision for the Future of Clinical Research*

On Monday October 4th I delivered the Keynote Address at our Annual ACCESS Program, which was focused on "Innovations in Clinical Research" (ACCESS stands for Academic Consortium for Clinical Excellence in Scientific Studies). Within 24 hours I also participated in a small think tank-like meeting, arranged by Dr. Elias Zerhouni, Director of the NIH, to engage a small number of medical school leaders and NIH directors to discuss "Clinical Research: A Vision for the Future." It was an interesting coincidence and juxtaposition that offered some examples and illustrations.

In my ACCESS address I highlighted the interrelationships between our Stanford School of Medicine Strategic Plan "*Translating Discoveries*" (<http://medstrategicplan.stanford.edu/>) and the NIH Roadmap (<http://nihroadmap.nih.gov>). In particular I pointed out the areas of overlap and interconnection between our strategic planning efforts, which formally began in the Fall of 2001, and the announcement of the NIH Roadmap in 2003. Indeed, I pointed out that I had shared the first iterations of *Translating Discoveries* with Dr. Zerhouni soon after he became Director, as he and other NIH leaders were beginning to formulate the Roadmap. In particular I highlighted what we have been doing at Stanford to help create the future rather than to simply react to the changes and forces around us. As you may recall, our School of Medicine strategic plan is multi-factorial and includes planning activities in each of our primary missions (education, research and patient care) in tandem with changes in enabling resources in the areas of finance & administration, information technology, communications, advocacy, and philanthropy. Emanating from this agenda, our overarching goals have been to:

- **Be a leader** in the movement to reform and rejuvenate the educational and career development of physicians and biomedical innovators.
- **Transform the future** of biomedical, translational, and clinical research and education by fostering novel collaborative alignments between basic and clinical scientists, clinicians, and educators throughout the University, as well as with public and private partners worldwide.
- **Earn the public's trust** and respect as a premier medical school through outstanding patient care and academic medicine.

To accomplish these goals we have sought to bring our community of basic and clinical faculty closer together. In doing so, we have attempted to align our goals and missions and to improve translational research through the development of our four Stanford Institutes of Medicine and more recently, the three enabling Centers that I have described in recent Dean's Newsletters

(http://deansnewsletter.stanford.edu/archive/10_04_04.html#1). We have also sought to

align basic and clinical science through our New Stanford Curriculum for medical students and through programs to enhance clinical training for graduate students and fellows.

In my ACCESS presentation I also provided an overview of the NIH Roadmap whose fundamental goals are to:

- Accelerate basic research discoveries and speed translation of those discoveries into clinical practice, and
- Explicitly address roadblocks that slow the pace of medical research in improving the health of the American people.

In particular, the NIH is committing approximately 1% of its budget to foster and enhance translational research in the three key areas of:

- ***New Pathways of Discovery*** -- e.g., developing molecular libraries and imaging probes; creating building blocks, biological pathways and networks; structural biology; bioinformatics and computational biology; nanomedicine.
- ***Developing Research Teams for the Future*** -- e.g., exploring new organizational models for scientific teams that are multidisciplinary and interdisciplinary but that seek to preserve the investigator(s)-initiated strategy.
- ***Re-engineering the Clinical Research Enterprise*** -- e.g., developing new partnerships that link patients, community-based health providers and academic researchers and that lower the bar to innovation

During the past year the NIH has created a number of Roadmap initiatives and Stanford has been successful in competing for a number of them. If you are interested in more details, I am posting the slides I used in my ACCESS presentation for your review (add presentation link here).

The meeting I then attended in Bethesda attempted to step back and ask what additional approaches might be considered to enhance clinical research in the 21st Century. The discussion was based on a strawman proposal that had been developed at an earlier internal NIH leadership retreat. It asked whether “the creating of new Departments of Clinical Sciences (or Departments of Translational Sciences) could potentially provide the field and Academic Health Centers with a consolidated platform from which to address and resolve the many cultural, organizational, and economic barriers to such research in the academic environment.” There were numerous underpinnings to the strawman, and the goal of the meeting was not to reach a conclusion but rather to explore the options, as well as to learn about approaches already underway at selected academic medical centers. Because this topic is so relevant to our own school-wide efforts, I wanted to share some of the observations I took away from this meeting.

First, although a limited number of schools were represented (Baylor, Case-Western Reserve, Duke, Harvard, John Hopkins, Illinois, Minnesota, Penn, Pittsburg, Stanford, UCSD, UCSF, UT Southwestern, and Vanderbilt) several things were notable:

- First, each medical school or center is engaged in planning and implementation of various initiatives to enhance or develop clinical research. Some of these are relatively new whereas others have been ongoing, in some cases for a number of years.
- Second, the various undertakings at different schools all reflect an institutional commitment to enhance clinical research and all require institutional support. In no case is the clinical research initiative an entity that provides net revenue to the school or medical center.
- While there are various degrees of partnership with industry (and the recognition that industry is more advanced in its clinical research enterprise) there was almost always the perspective, among the participants, that it is important to assure that the clinical trials being done in academic settings are high quality and have strong scientific underpinnings – and that they **not** be “clinical research organization” (CRO) in quality.
- Among the most established initiatives is the Duke Clinical Research Institute (DCRI), which includes a broad cross-disciplinary critical mass, provides infrastructure and resources (including portions of grant indirects), and provides training and career development. The DCRI arose from a strong cardiovascular clinical trials base but has now become an institutional resource with its own facility. It will expand to include ambulatory clinical research and a Phase I unit dedicated to “experimental medicine.” However, the DCRI is not a department and there is no intention of moving toward that kind of structure. Moreover, a perceived strength is that the DCRI is not departmentally based but is cross-disciplinary.
- A newer model just being developed at UT Southwestern has created a Department of Clinical Research (thus coming closest to the NIH strawman proposal) that seeks to provide a home for all involved in clinical research. It too is cross-disciplinary and seems to thrive on that basis. However, this model seems to be diminishing, at least at this juncture, the interactions between clinical and basic science faculty.
- As an alternative, the model at Vanderbilt is built around an enhanced role for the General Clinical Research Center (which is engaged in training as well as clinical research) and a very strong program in informatics.
- The evolving model at UCSD is seeking to create a “college of integrative health sciences” that has foundations in an Institute for Molecular Medicine, as well as an interesting partnership model with biotech through Transmed and the goal of bringing together resources in advanced imaging, ambulatory clinical research and associated laboratory programs.
- Other programs concentrate their efforts on teaching and training. For example, UPitt has a clinical research training program for medical students that it is trying to make comparable to the traditional MSTP program for MD/PhDs who pursue careers in basic science. Vanderbilt and Hopkins both have programs that help foster and support fellows or junior faculty to pursue careers in clinical research by providing training and financial support.

I was pleased to learn about the various types of programs being developed at various centers around the country and to also note how far we have come at Stanford – even though we have a long way to go. There is one fundamental factor, which I emphasized in my own comments, which I think is important, certainly for Stanford. Namely, while there is no question that we need to develop the infrastructure support to further enhance translational and clinical research, I strongly feel that it would be a mistake to separate and potentially isolate our basic and clinical faculty and investigators. Indeed, an overarching goal in *Translating Discoveries* is to bring these communities closer together. We are moving forward towards this goal in many ways, such as the following:

- Aligning faculty within the School and across the University in our Stanford Institutes of Medicine (including Cancer/Stem Cell Biology, Neurosciences, Cardiovascular, and Immunity/Transplantation/Infection) and linking them to the comparable clinical centers at SHC and LPCH.
- Further fostering our faculty alignment through the enabling Centers for Genomics/Genetics, Informatics, and Imaging, which are intertwined with each of the Stanford Institutes of Medicine.
- Creating alignments with the broader University through the new Department of Bioengineering (joint between Engineering and Medicine), through BioX and through other new initiatives being developed across the University (e.g., in the areas of the environment and of international affairs).
- Further developing the infrastructure and support to enhance clinical research, including institutional innovation grants that bring together faculty from different schools to explore new pathways or that align basic and clinical investigators to address new problems in translational medicine.
- Redefining our education programs to develop scholarship, leadership and, where appropriate, a concentration in clinical research. This initiative includes efforts to better connect undergraduate medical training with postgraduate programs in order to foster development of physician scientists. It also includes the development of enriched training for graduate students, such as the establishment of new joint degree programs. The latter will be addressed via the Commission on Graduate Education recently appointed by President Hennessy.

Clearly one of the current strengths is the diversity of pursuits at different academic medical centers. There is not, nor should there be, a “one size fits all.” Rather, innovations and experiments at different institutions are and should be carried out in ways that engage their unique cultures, and hopefully, foster and stimulate clinical and translational research. In my comments at the NIH meeting I stressed that a Department of Clinical Research (the strawman proposal) was not consistent with the goals we have laid out at Stanford, but that I recognized it may be appropriate for other schools or centers. Gathering experience and outcome metrics on how these various programs are working during the years ahead may be one of the most important things we can do.

With the NIH Roadmap, the NIH is already directing resources to enhance clinical research. Given the funding limitations now before us, I spoke against adding additional dollars and in favor of reprogramming resources from within the Roadmap allocation to

help foster innovation. Indeed, among my own recommendations was the creation of an innovation fund, analogous to the NIH Director's Pioneer Award, which could be made available to institutions that were pursuing or developing novel approaches to fostering clinical research (Parenthetically, I also emphasized the importance of not further altering the funds available in the RO1 pool – which are now all too limited for new and competing grants).

Although it should be underscored that the NIH leadership is exploring different options and that no immediate conclusions are at hand, it is very encouraging to know that they are seeking input about new directions and that many centers, including Stanford, are already exploring and implementing interesting innovations in clinical research.

Draft of the Integrated Clinical Plan for the Stanford University Medical Center

Over the past couple of months, Martha Marsh, President & CEO of Stanford Hospital & Clinics, Chris Dawes, President & CEO of Lucile Packard Children's Hospital, and I have been working on "An Integrated Clinical Plan for the Stanford University Medical Center: The School of Medicine, Stanford Hospital and Clinics and Lucile Packard Children's Hospital at Stanford." We reviewed the draft document with President Hennessy on September 27th and with the Medical Center Committee of the Board of Trustees on October 11th. The draft plan reviews the individual school and hospital goals as well as the overarching goals and objectives of the Medical Center as a whole beginning with our shared vision:

- To create knowledge through research and innovation
- To educate future leaders in medicine and the biosciences
- To translate discoveries in medicine into efficacious, efficient, and cost-effective clinical care
- To improve the health of patients with state-of-the-art diagnosis and treatment

A number of factors lie behind the development of this plan, including the following:

- SUMC is fundamentally an academic medical center, and it derives its unifying purpose from the educational and research/innovation missions.
- The rapid pace of change in the health care environment requires our strategic plans for academic and clinical services to remain flexible while still providing a guiding vision for SUMC.
- Essential to the success of SUMC is the development and implementation of a sustainable business model that ensures support for on-going programs as well as opportunities for investment in new programs and facilities.
- Limitations on space and faculty size are recognized explicitly as challenges that will make the translation of strategic plans into successful operational initiatives a complex undertaking for all three entities.

We note in the plan the importance of focus, given our overall size and location. Accordingly, the clinical strategies within the draft plan delineate selected clinical

services to be emphasized based on talent that currently exists or that is slated for recruitment in conjunction with market strategies and the requisite internal and external management initiatives associated with their success. Concurrently, the Stanford Institutes of Medicine (http://deansnewsletter.stanford.edu/archive/10_04_04.html) have the goal of bringing together faculty from basic and clinical science to translate discoveries from the research laboratory to the patient. Each of the four Institutes (Cancer/Stem Cell Biology, Cardiovascular, Immunity/Transplant/Infection, Neurosciences) is closely linked to a clinical center of excellence (or service line) at SHC and LPCH. Thus, they provide a unifying theme for aligning faculty and clinical programs with the goal of improving the diagnosis, treatment or prevention of disease. Further, the Stanford Institutes of Medicine and their related clinical programs will differentiate Stanford from other medical centers and providers, especially when coupled with outstanding quality of care and patient service.

We also note in the draft plan that although SHC and LPCH exist in a single medical center, they are distinct providers, occupying different positions within the health care marketplace. For example, SHC is both a teaching hospital and a community hospital. It must therefore attend to its local market as well as the much larger regional, national, and international markets that are required to support the tertiary and quaternary services associated with its academic mission. On the other hand, as a specialty children's hospital, LPCH serves a much larger patient base with a predominant focus on tertiary/quaternary care through relationships with many different provider networks and health care systems. Similar to SHC, LPCH's obstetric and general pediatric services provide support to the local community and as such require LPCH to be responsive to community needs and standards.

The draft integrated plan also addresses what is one of our major shared challenges – space and facilities. We have been working on an integrated master facilities plan that also represents an accommodation to the often conflicting demands of strategic program plans, aging facilities, regulatory requirements, the extraordinary value of contiguous on-site growth and the limited capacity for additional growth on the Stanford campus (due to the General Use Permit and other political realities). Accordingly, the school and hospitals are developing plans that include both on-site development and moment of services and functions off-site.

Clearly, the strategic and financial health of the two hospitals and the School of Medicine are critical to each other's well being. Each engage annually in strategic financial planning processes that coordinate strategy, capital planning, operations, and investment management. The expense base of each hospital includes mission-based payments to the school that augment professional fee revenues and help ensure that the necessary complement of physicians and clinical faculty are available and, ideally, paid at competitive rates. The school's annual operating clinical expenditures and strategic investments include the physician, staff and infrastructure costs associated with the adult ambulatory practice as well as the research and development costs of clinical innovation critical to the success of the hospitals.
